NEW YORK, THURSDAY, JULY 2, 1874.

The Week.

THERE have been some ripples in political affairs during the week, but on the whole it has been quiet. Up in New Hampshire the Democrats in the Legislature have been behaving in a manner to shock beyond expression their Republican brethren. They have been turning the latter out of office, redistricting their districts in a subdolous and gerrymandering manner, and generally conducting themselves as Republicans have done on similar occasions. The grief of the latter is not, therefore, soothed with universal sympathy, although it is feared that all these wiles of the Democrats may hereafter secure that party a control of the State even when it has not carried it by the popular vote. Mr. E. H. Rollins, former Republican manager in New Hampshire, must hear this with a grave smile. On the other hand, it is predicted that, if this is what you call Democratic reform, many men of independent minds "will cut bait in the next election"—a nautical term meaning that they will refuse all active participation in the campaign. In Massachusetts there is the withdrawal of Mr. Dawes and Mr. George Hoar, and the rumored withdrawal of Judge Hoar and General Butler. This would leave Massachusetts with a delegation weakened of its strongest elements both of good and evil, but loss would much preponderate over gain, especially as Butler's retirement because he chose, and not because he must, would make his disappearance not a blessing unmixed. And the new Congress needs to be strong, for it is to do its work amid the distractions of a Presidential contest. From other parts of the country little is now heard. In Washington, Mr. Creswell has resigned, and Mr. Hale, next friend of Mr. Blaine's, has succeeded to him, thus giving the quidnuncs a problem with which they have been very busy—namely, whether this appointment means that Mr. Blaine is General Grant's first choice for the next Presidency and is to have the patronage, or whether it means that the President wished to propitiate Mr. Chandler, whose daughter Mr. Hale married, in order that the father-in-law might support him in getting a third term. This question is not yet solved. In South Carolina they indict more officials for theft, and Moses pardons them, and now threatens to run again as a candidate "in order to be vindicated." In Iowa there has been an "anti-monopolist" convention, which was for hard-money, and which will probably in any event be made master of the State at the approaching election. In Indiana and Illinois a black outlook for the Republicans is reported.

The announced retirement of Mr. Dawes from Congress has naturally called out notices of his public life in the Massachusetts papers which have been of a kind and complimentary character. For a man to have served continuously eighteen years in Congress is undoubtedly in these times a remarkable fact, and the Massachusetts citizen is ordinarily proud of keeping his representative in Congress, and may well have some misgivings as to the successor. Mr. Dawes may be said to be the product of an intelligent New England constituency, above the level of which he never rose, and in advance of which he never ran. He did not find out that the civil service needed reform until his constituency were fully aroused by its abuses, and then his fourteen years of experience in Congress were insufficient to enable him to suggest the proper remedy. Although industrious and assiduous, he has never shown any sign of statesmanship, and his almost unequalled experience has merely made him skilled in the jangling machinery of Congress—able to push a measure he favored or to obstruct one to which he was opposed, but unable to make the machine of government better than he found it, or to direct its working towards the end of permanent good. In his eighteen years of service he has never uttered a sentiment or originated a measure which any one can call to mind; and if he should remain in Congress fifty years, he probably would never be able to deduce general principles from governmental experience, nor forecast the necessities and means of national progress. As a public economist he inherited Mr. Washburn's ideas, which were to make speeches against extravagance, to vote against all expenditures, right or wrong, and to shut one's eyes to everything beside. If Mr. Nast had ever turned his sarcastic pencil against Mr. Dawes, he might have portrayed him as a little spigot, smiling blandly at his own tightness, while the revenue rolled in volumes from the Treasury bung-hole. In character, Mr. Dawes has always been "thoroughly respectable," but never high-minded. He would spurn a bribe, or vote against a job; but next you might find him making political capital or obeying some fancied law of party necessity by opposing a measure which he believed to be just, or writing an equivocating letter denying his connection with Crédit Mobilier. It is in moral courage that he has been most defective—active when the battle was to be fought with blank cartridges, like the first Butler campaign, or in attacking a broken-down official like Richardson, but too ready to retreat under cover when the fighting became really dangerous. A man so timid, so sensitive to what people think, and yet with so little faith in the abiding judgment of the better part of mankind, could never be a statesman, and his "respectability" has done a great deal towards keeping things as they are—that is to say, in the mire.

We told last week of a scheme of Senator Carpenter's to gag ourselves and all our fellow-members of the press, and told also how he had come out in a letter and explained that he had never for a moment nourished any such design. There has since been another excitement from a similar cause, but according to some accounts our apprehensiveness was as groundless as before. Mr. Poland, of Vermont, proffers the Boston *Advertiser* what he calls the true history of the latest bill for destroying the liberty of the press. He says that in 1870 Congress passed an act establishing a police-court in the District of Columbia. Previously there had been none. The new law gave to this court original and exclusive jurisdiction of certain crimes—all, that is to say, not deemed capital or otherwise infamous. But soon the Supreme Court of the District strongly intimated that this granting of so extensive a jurisdiction to a court wherein there was no provision for trial by a jury was unconstitutional. Upon this the bench and bar of the District began to feel alarm at a possible condition of things in which there should be a considerable body of offences with no court whatever having jurisdiction over them, and Mr. Poland was asked to introduce an amended bill giving to the regular criminal courts a concurrent jurisdiction with the police-court. This was the chief object of the bill. There was, however, another defect to be remedied. An indicted criminal fleeing from the District was secure. The constitutional provision for the rendition of fugitives applies to States only, and the second object of the bill was to extend this provision to the District also. Mr. Poland adds that the thought of newspapers never crossed his mind; nor does he yet see why any newspaper writer should be in any fear of the bill. Mr. Poland has been a Vermont judge, and probably knows what he is talking about, but the Washington correspondent of the *Tribune* asserts that the bill would never have been mentioned by the newspapers if a Senator had not pointed out to the reporters that the eleventh section of the Carpenter bill was much less dangerous to newspaper men than the Poland bill. This comports well with the fact, not yet explained by Mr. Carpenter, that excellent lawyers in the Senate

at once attacked his innocent-looking eleventh section, and indeed supplied the newspapers with the objections which have been made.

The firm of Phelps, Dodge & Co. have replied to the wild accusations brought against them by General Butler, in his speech of June 19th, in a very effectual manner. The first charge was that the firm had attempted to defraud the Government by importing metals in the form of works of art. Their reply to this charge is, "that the importations to which General Butler referred were made before the firm of Phelps, Dodge & Co. came into existence, and before any one of the present or late members of the firm became connected with the metal-importing business; the senior member of the firm, William E. Dodge, being at the time engaged in the dry-goods business." We may add that this charge had been carefully examined and publicly exploded by Mr. D. A. Wells some weeks before the General made his great speech. His second charge was that in a certain tariff act Mr. Dodge "went to the Treasury and had a comma taken out of one place and put in another, and thereby cleared $2,250,000." The reply of the firm is that this historic comma, which made nonsense of the tariff act and imposed "two conflicting rates for one and the same article," was "taken out" by Mr. Fessenden, then Secretary of the Treasury, who decided, as he was no doubt quite right in doing, that the sense of the act required it; and that the firm did not make anything by the change. For the benefit of those of our readers who may not be skilled in the science of hermeneutics, we may say that the taking out of commas, when done by the Secretary of the Treasury, even at the request of William E. Dodge, is not a criminal act, and is indeed frequently done by courts of the highest jurisdiction in the construction of statutes. Butler was soundly scored by several of his fellow-members on the occasion of his harangue, which was even more foolish than usual, and even better adapted for injuring himself and his cause.

General Sherman's removal of his office as General of the Army from Washington to St. Louis is probably to be best understood by military men, but it has been made the subject of some newspaper articles of a more than commonly bitter character, and it becomes a proper subject for lay comment. As if in answer to these articles, there have now been published two letters which throw light on the subject—one from General Sherman, written four years ago, and addressed to Secretary Belknap, and one from General Grant, written eight years ago, and addressed to the late Secretary Stanton. Both are characteristic—General Sherman's being as forcible as usual, and General Grant's as plain and simple in intention as usual, though rather less clumsy in expression. The gist of them both seems to be this: In the army regulations made in 1847—which General Sherman mentions with praise—the General of the Army was given very full control of it. But later, in the days of President Polk, when General Scott quarrelled with Secretary Marcy, this control passed to the Secretary of War; and, later still, says General Sherman, though General Grant has nothing to say about this, it became the policy of Jefferson Davis, and, after him, of his successor, Floyd, to keep the General-in-chief as much as possible subordinated to the Secretary of War, in order that thus the army might go into the war of secession without a legitimate head. General Sherman is always forcible in speech, but about his being always right there are doubts, and all this may or may not be history. It is certain that General Grant, who in 1866 was very desirous of rehabilitating the office of General, and wrote as much to Secretary Stanton and got his wish, has since taken a different view, and it seems altogether certain that there are two sides to the question whether it is best for the army to be managed by the President as Commander-in-chief, through the Secretary, or to be managed by the General. This is an old conflict. It is, however, easily conceivable what General Sherman thinks on the question, and it is conceivable, too, that he is just the man, after thinking of it for some time, to cast the dust of Washington off his feet in some indignation and betake himself to St. Louis. We have spoken of some of the newspaper articles as having been uncommonly bitter; but they had a sort of malicious pettiness which doubtless did much to defeat their aim. This aim was to persuade people that Grant was now so low that Sherman felt compelled to drop him.

General James Watson Webb has communicated to the public the first part of his defence against the charges recently preferred against him in Congress. It is in the shape of a very long letter, as might have been expected, for General Webb's accomplishments in this line have been famous for many years; and it is very pugnacious and abusive, it being also now many years since General Webb has been surrounded by enemies—some of them pretty constantly incited by British gold, others of them natural foes, such as Barnburner Democrats and Whigs of various stripes except the right one. Secretary Fish is one of these latter, and gets some of the old-fashioned ponderous billingsgate flung at him. But the defence, so far as it can be judged from this instalment of it, is certainly no defence at all. The charge was much as follows: General Webb, being in 1860 sent to Brazil as our minister, pushed a certain claim, and by-and-by recovered a heavy sum, but under the protest of Brazil. The State Department received in due course $25,000. Soon after it seemed to our Government that the money should be returned, and the $25,000 was sent to Brazil, whence word immediately came that this was not the full amount nor the half of it. The State Department, according to Judge Hoar, traced £5,900 sterling, sent at the time the award was originally made, to Mr. Webb's London bank-account, and as good as said that it was a part of the money paid by the Brazilian Government and sequestrated by General Webb to his own use. We give a fair idea of the defence of which we speak when we say that General Webb meets this point by saying that, as soon as he heard of the charges made, he wrote to Messrs. Baring, and that in reply they sent him a letter, which he appears to present with a complete reliance on its sufficiency. Yet what is it? Messrs. Baring tell him they have received his letter, and on examination find that in 1867, the year in question, they had bought for him in Europe £5,798 worth of United States bonds, and sent them to him at Rio. Nothing more is offered in explanation. As for the general line of reply, Webb asserts that Mr. Fish hates him, and hated Seward, and seeks revenge in slander; that Mr. Seward knew and approved Webb's action, and that it was not in any sense a secret; and he hints that the missing money went to Brazilian officials as a corruption fund. Asked for the names, he answers that undoubtedly certain of the political leaders of Brazil would be very happy to get hold of them, but that he is not going to tell. The Brazilian officials should estimate at its true value this rather rare spirit of self-sacrifice.

One of the most important and largest granges in the country, "Good Hope" Grange, of McDonough County, Illinois, has voted, with only two dissenting voices, to disband and surrender its charter and its existence. The reasons given by these grangers are that the original principles of the organization have been entirely ignored; that the officers have assumed powers which are tyrannical, arbitrary, and entirely subversive of good order in the lodge and in the community; that the officers of the National Grange have behaved in a systematically autocratic way, ruling with a rod of iron; that large sums of money have been collected by the several State Granges and the National Grange, for which no adequate return has ever been realized by the individual members of the order; that a disposition has been from time to time manifested by the State and other officers of the order to change the organization from its original plan to that of a political party; that, in short, the Grange movement of McDonough County is a failure. The resolutions passed are the more remarkable from the fact that McDonough County is on the line of the Chicago, Burlington, and Quincy Railroad, a line owned by grinding monopolists—non-residents at that—who have for many years been engaged in those operations which are known in times of commercial activity

as carrying the products of the grain-fields of the West to deep-water, and in times of commercial depression as sucking the life-blood out of the heart of the same section of country.

The most interesting parts of Mr. Evarts's address on Chief-Justice Chase, delivered before the Alumni Association of Dartmouth College, were those devoted to the legal-tender cases and the impeachment of Andrew Johnson. With regard to the latter, Mr. Evarts's opinion that it was chiefly due to Mr. Chase that the first great impeachment case in the history of this country was not degraded to the level of a political proscription, will probably be felt to be more and more true as time goes on. With regard to Mr. Chase's position as to legal-tender, Mr. Evarts was not so successful in justifying the apparently irreconcilable conflict between Mr. Chase's action as Secretary of the Treasury and his action as Chief-Justice. Indeed, Mr. Evarts did not attempt to reconcile them. Of his general estimate of the character and abilities of Mr. Chase, we may say that it has something of the glow of the orator, but appears to be in the main a just estimate—just enough for the present, at least. Time makes strange work with the names of the successive greatest and wisest of the race, and what he does in other lands we may count upon his doing in this also.

The proceedings against the notorious Police Commissioners, Charlick and Gardner, instituted some time since by Tammany Hall, have resulted in their conviction by a jury of fraudulent election practices, the imposition of a small fine, and the resignation of the Commissioners. Nothing could show more strongly the effect which the obstinacy and insensibility to public opinion of the Mayor is having in its turn on the public opinion of this city than the ready credence obtained by the rumor, started immediately after the termination of the proceedings, that Charlick and Gardner would be immediately reappointed to office. Whether they will be or not we do not profess to know, but a precedent for such a proceeding having been lately given by no less a person than the President of the United States, in his reappointing "Boss" Shepherd in Washington, we see no reason why any one should be surprised if mayors of large cities follow the example. The case is an important one, however, for Republicans to consider. The Police Commission of this city is the chief supervisory election machine in the country, and, considering the value of New York in a Presidential election, it would not be going too far to say that upon the constitution of this board the fairness or unfairness of a Presidential election might well turn. After the reform-movement war against Tweed, it was in the power of the Mayor to make this commission respected, and thereby greatly strengthen the hands of the party which was opposed to the discredited and despised organization of Tammany Hall. Instead of that, we see the reform movement and the Republican party discredited by the establishment of a firm alliance between the reform Mayor and these notorious men, and their removal from office effected, if it has been effected, by Tammany Hall itself. Their conviction is political capital, and good political capital, for the Democratic party.

A matter with which people had supposed they were done has just been brought forward again by Mr. Theodore Tilton. His new production leaves the public about as well informed in regard to the real nature of his charges or wrongs as it was before; but we do not think there is any doubt in the public mind as to the degree of wisdom he has exhibited in his recent course. On his own showing, he appears to have condoned all the offences against him, such as they may have been, and for one reason and another to have maintained a silence or a sort of silence for many months. Whatever the hardships which this course entailed upon him, they were all a part of the game he had chosen to play, and he should have played it to the end like a man and borne all the consequences. It can hardly be thought that the ill word of Dr. Leonard Bacon should have made so unbearable an addition to his woes that he must after so long an endurance at last make a confidant of the public. And this, indeed, he has not done. The confidence is incomplete, and for our part we hope it is to remain so, unless Mr. Beecher's friends see fit to exact from Mr. Tilton a full disclosure. Meantime, talk and counter-talk are as rambling, half relevant, and mutually contradictory and confusing as anybody need desire.

The course pursued by our Common Council in reference to the dogs is having some strange results. For one thing, there has been a horrible brutality, due to gross stupidity rather than cruel intent, in the killing of them. This could have been avoided in a dozen ways, but the Aldermen, apparently with a rough contempt for what they regard as the sentimentality of Mr. Bergh's Association, would have nothing to do with that body, refused to allow it to take charge of the executions, and gave the duty to a man of their own, who seems to be such a man as might be expected. Smothering the dogs has been his endeavor, but, in his ignorance of the nature of carbonic-acid gas, he has made extremely unsuccessful attempts. The details are a disgrace to our civilization, or would be if our city government and its ordinances represented our civilization. Another marked result of the municipal policy in the matter has been that it has greatly excited the human community, and apparently the canine community as well. It need not be doubted that the dogs are aware of what is going on; indeed, the general hunting of them by vagrant boys would suffice for that, and reports of bites are very unusually frequent. As for men and women, they are in a sort of small panic about hydrophobia, all the alleged cases of which are given in some of the papers with a most disgusting and demoralizing fulness. One man who some time since was bitten, has even been joked by his companions into believing himself hydrophobic, and has been taken to the hospital in a state of mania. Clearly this was superinduced by his fears, which again the criminal conduct of the newspapers had doubtless caused or increased. What proportion this kind of case bears to the total number of alleged hydrophobic cases even the doctors cannot say, but we may well believe it an extremely large one. And we may well doubt if any such measures as the Mayor and Council have taken are in any way defensible. At the same time, probably no reasonable man objects to seeing our city streets cleared of misbegotten, wretched dogs without proper masters, or without masters at all. It is this feeling which gives the ordinance a public support on the whole sufficient to sustain it.

The work of the past fortnight in Spain has been the attempt to force the position of the Carlists at Estella, a strongly fortified town on the river Ega, in Navarre. As early as the 16th of June, it was reported that Gen. Concha had begun the attack, but bad roads, consequent upon bad weather, delayed him, and it was not till the 25th or 26th that he crossed the Ega suddenly, and carried by rapid assault, in the midst of a terrible storm, three villages in the suburbs of Estella on the north and east, cutting off the line of retreat for the Carlists. On Saturday, he marched directly upon Estella, and in the night made an attack on Muro, about two miles distant, but, exposing himself in the front rank, was instantly killed. The army, discouraged by so great a blow, and being repulsed, fell back in more or less disorder, and with a loss which was probably heavy, to the respectful distance of Larraga and Tafalla, where it awaits the arrival of its new commander, Gen. Zabala. He will have much to do if he would rival the brilliant services of the veteran who preceded him, and whose death as well as successes ought to prove a wholesome inspiration to the army. Operations in other parts of Spain have been of some importance. On the 19th, Don Enrique was killed in an engagement at Alcora in Castellon, and Don Alfonso signally defeated on the 27th and 28th at Chelva, in the province of Valencia; and generally the Carlists have fared badly wherever they were encountered. Don Carlos was to have reached Estella on the 27th, and may be expected to take part in the next battle of importanec in the north.

THE WORK AND CHARACTER OF CONGRESS.

THE daily press has classified the work of the present Congress with remarkable unanimity in holding that the things which ought not to be done Congress has very properly left undone, and the things which ought to be done it has left undone likewise. In other words, the judgment of the country is that the sins of Congress are those of omission rather than of commission; and that we have not had a very bad Congress because we have had as nearly as possible no Congress at all. There are, however, some exceptions to this generalization, and the exceptions, strange to say, are each of unusual magnitude. On the positive side of good works may be noted the revision of the statutes, which is one of the largest and best-executed pieces of legislative work that the country has had for fifty years. It is not to be supposed that the present Congress, which has talked so much and done so little, began and finished the work of revision. On the contrary, this began many years ago, with a commission which did nothing except, we believe, rent a pleasant smoking-room, appoint a clerk, and draw pay. It then fell into the hands of a very competent commission, which really performed the task of revising in an able if not masterly manner. But when their report was laid before Congress, it became evident that revisions of substance would call out more debate than could be compassed by a session, even though nothing else was talked about, and it was therefore wisely determined to give up the hope of revising, and be content with the task of codifying. Accordingly, one of the ablest and most painstaking lawyers in the country was retained to go over the work of the commissioners, and cut out all changes of substance, so that what was left would be a code of existing law. Finally, with the assembling of the present Congress, Mr. Poland gave himself up to the work of perfecting and carrying the bill. The merit of Congress was in allowing competent hands to do the work, or in throttling the ignorant, self-opinionated legislative tinkers, who generally spoil whatever the competent few in Congress undertake.

To the same class of positive legislation belongs the Sanborn investigation, with its results of the Republican Treasury Department overturned and the demoralizing moiety system abandoned. And it is noticeable that for this, as for the preceding important measure of the session, we are chiefly indebted to an individual. The sub-committee of the Ways and Means, consisting of Messrs. Foster and Beck, stumbled unsuspectingly upon the trail, which they pertinaciously followed. For Mr. Beck to investigate his political opponents was characteristic, and neither creditable nor discreditable. But for Mr. Foster to forego the usual party pleasure of whitewashing his friends, and to brave the combined power of the Treasury, the secret service, the informers, the President, and the then Republican leader of the House of Representatives, and to pursue his investigation in a quiet and resolute way, with very little intention of arousing the public, and with no intention whatever of abandoning the enquiry, let the result be ever so damaging, certainly required a fair share of moral courage, and is one of the hopeful signs that our younger public men of the better class are beginning to regard "party" as nothing more than an instrumentality for the public good. And here we may observe parenthetically that the men who have not been afraid to "damage the party" have done the most to keep it upon its legs. If a gentleman of as irreproachable private character as Senator Buckingham had refrained from joining in certain whitewashing reports, and had stood in Mr. Foster's shoes at the time of the last Connecticut election, we feel pretty confident that Connecticut would now be one of the Republican States.

A codification which runs back to the very beginning of the Government, and analyzes the very worst specimens of statutory law that the whole world contains, and an investigation which entirely upsets the most powerful executive department of the Administration, are certainly unusual achievements for Congress, and of an unusually creditable character. But not less unusual in character are some of the discreditable acts, and noticeably the votes upon inflation and the abandonment of civil-service reform. For our representatives in Congress defiantly to betray the very issues upon which they were elected, and to do so without any decided change in the popular will, is happily not one of the ordinary offences of Congress. Our politicians in office are generally very careful to adhere in form to the party prescription, however they may dose the patient in secret; and they generally work up a new departure before they venture to take it. In these two exceptional instances, it is easy to trace the demoralizing influence of the two successful demagogues, Butler and Morton, and the growing belief in the mind of the small-sized Congressman that he must have offices to control conventions, and conventions to control the people. The continued hankering after the franking privilege and the audacious apostasy from civil-service reform—especially after substantially every official report, including even the Pension Bureau's, had testified to the beneficial effects of the trivial effort of the Administration—are two of the most suspicious things connected with the present House, and almost lead one to the conclusion that if we must have small men in Congress, the more frequently we change them the better.

Soon after the beginning of the session which has just closed, a new member of the House, who has had much experience of human nature and but little of political life, was asked what he thought of his fellow-members. He replied favorably as to their integrity, but very poorly as to their attainments and intellectual capacity. The result of the session goes a great way to sustain this estimate. The talk, the tardiness, the general inaction, are characteristic of men not fitted for their business; the unusual absence of jobs and rings is indicative of their general well-meaningness. A House of Representatives which could only be held together by speeches that produced laughter, and that allowed itself to be bullied and led by the buffoonery of Butler, is not one from which much can be hoped; and the general expression of the country is not far from the right one when everybody thanks heaven that we have got off so well. The present House of Representatives is the most unwieldy legislative body that the country has ever had—for which, however, it is not responsible—and it is made up largely of ignorant men of a lower average of intellectual ability than is usually found there; but nevertheless it has done some of its work courageously and well, and we may gather hope for the future from the fact, which the public is beginning to recognize, viz., that the worst elements in Congress are among the old members.

The capacity or incapacity of a legislative body depends of course not alone upon the character of its members but upon the difficulties which they are to encounter, and the magnitude and complexity of the questions with which they are to deal. The mere political attorney who comes to Congress instructed by a convention on some particular policy or question, and who regards himself as useful and exemplary if he ostentatiously works up to his instructions, falls very far short of a lawgiver for a country which at present teems with intricate constitutional, political, and commercial questions. Our financial troubles, our paralyzed industries, our wrecked railway and manufacturing enterprises, are largely due to the constant presence of this cheap and worthless material in Congress. It has also been one of the worst features of Congress, and particularly of the House, that the few able and upright men who are always to be found there have possessed so little influence. The fact is attributable not to a natural arrogance or incapacity of the American character, but to the continued sending of this cheap and worthless material, and the continued withholding of the quiet, studious, thinking men who are to be found more or less in every district. The work of legislation is work of the most involved description. There is no man in the country who can say that he is the master of its principles or its details; but there are plenty of men competent to take it up as a subject of work and study; to come to Congress and unite their labor with that of others; to apply their practical common-sense toward working out useful results; and to aid in stamping out the ignorance and idleness and arrogance that have been found to be such constant obstructionists in Congress. We are now to all in-

tents a commercial people, with all the interlocking interests of commerce and its innumerable complexities. The farmer of a century ago dragged his few productions to the market on a vehicle which his neighbor made. His implements were largely of his own fashioning, and of machinery he had none. The farmer of to-day depends upon machinery from the sowing of his seed to the threshing out of his harvest, and upon the railway operator for the vehicle which will carry his grain to the market. Yet the farmer of to-day, whose interests are so manifestly interwoven with a hundred other interests, is content to pick out some ambitious talker; to instruct him properly by vague resolutions, drawn up by a politician in whom nobody has confidence; and then to walk over to his really sensible neighbor who ought to be in Congress, but is deemed too good a man to go there, and bewail the incompetency of Congress and the heartlessness of politicians. The two measures which we first noticed—the revision of the statutes and the Sanborn investigation—are examples, the one of patient, unassuming legislative work, the other of faithful, resolute reform, irrespective of party and political effect; and, as we note the approval bestowed on each by the more reflecting part of the community, we see indications that the community is growing more disposed to send men to Congress of whom hard work and common-sense will be the characteristics, and to awaken to the fact that the business of legislation is really business, and that it concerns ourselves.

RÔLE OF THE UNIVERSITIES IN POLITICS.

MR. GALTON, in his work on 'Hereditary Genius,' has drawn attention in a striking chapter to the effect which the systematic destruction and expatriation, by the Inquisition or the religious intolerance of the government, of the leading men of the nation—its boldest thinkers, most ardent investigators, most prudent and careful and ingenious workers, in generation after generation—had in bringing about the moral and political decline of the three great Latin countries, France, Spain, and Italy—a decline of which, in the case of the two former at least, we have probably not seen the end. The persons killed or banished amounted only to a few thousands every year, but they were—no matter from what rank they came—the flower of the population: the men whose labor and whose influence enabled the state to keep its place in the march of civilization. The picture is very valuable (particularly just now, when there is so great a disposition to revel in the consciousness of vast numbers) as calling attention to the smallness of the area within which after all the sources of national greatness and progress are to be sought. The mind which keeps the mass in motion, which saves and glorifies it, would most probably, if we could lay bare the secret of national life, be found in the possession of a very small proportion of the people, though not in any class in particular—neither among the rich nor the poor, the learned nor simple, capitalists nor laborers; but the abstraction of these few from the sum of national existence, though it would hardly be noticed in the census, would produce a fatal languor, were the nation not constantly receiving fresh blood from other countries. This element was singled out with considerable accuracy in France and Spain by religious persecution. It would happily be impossible to devise any process of selection one-quarter as efficient in our age or in this country. The one we have been using for the last twenty years, and on which a good deal of popular reliance has been placed, is the accumulation of wealth; and under this "the self-made man"—that is, the man who, starting in life ignorant and poor, has made a large fortune, and got control of a great many railroads, and mines, and factories—has risen into the front rank of eminence. The events of the last five years, however, have had a very damaging effect on his reputation, and he now stands as low as his worst enemies could desire. As he declines, the man of some kind of training naturally rises; and it would be running no great risk to affirm just now that the popular mind inclines more than it has usually done to the belief that trained men—that is, men who have been prepared for their work by teaching on approved methods—are after all the most valuable possession a country can have, and that a country is well or ill off in proportion as they are numerous or the reverse. One does not need to travel very far from this position to reach the conclusion that there is probably no way in which we could strike so deadly a blow at the happiness and progress of the United States as by sweeping away, by some process of proscription kept up during a few generations, the graduates of the principal colleges. In no other way could we make so great a drain on the reserved force of character, ambition, and mental culture which constitutes so large a portion of the national vitality. They would not be missed at the polls, it is true, and if they were to run a candidate for the Presidency to-morrow their vote would excite great merriment among the politicians; but if they were got rid of regularly for forty or fifty years in the manner we have suggested, and nothing came in from the outside to supply their places, the politicians would somehow find that they themselves had less public money to vote or steal, less national aspiration to trade upon, less national force to direct, less national dignity to maintain or lose, and that, in fact, by some mysterious process, they were getting to be of no more account in the world than their fellows in Guatemala or Costa Rica.

There will come to the colleges of the United States during the next fifty years a larger and larger number of men who either strongly desire training for themselves or are the sons of men who are deeply sensible of its advantages, and therefore are at the head of families which possess and appreciate the traditions of high civilization, and would like to live in them and contribute their share to perpetuating them—and they will not come from any one portion of the country. There are, unhappily, "universities" in all parts of the Union, but there is hardly a doubt that as the means of communication are improved and cheapened, and as the real nature and value of the university education become better understood, the tendency to use the small local institutions passing by this name as, what they really are, high schools, and resort to the half-dozen colleges which can honestly call themselves universities, will increase. The demands which modern culture, owing to the advance of science and research in every field, now makes on a university, in the shape of professors, books, apparatus, are so great that only the largest and wealthiest institutions can pretend to meet them, and in fact there is something very like false pretences in the promise to do so held out to poor students by many of the smaller colleges. They doubtless do a certain amount of work very creditably; but they are uncandid in saying that they give a university education, and in issuing diplomas purporting to be certificates that any such education has either been sought or received. The idea of maintaining a university for the sake of the local glory of it, is a form of folly which ought not to be associated with education in any stage. It is like buying a bad gun, which you know is likely to burst in your hands, because it is of native manufacture. These considerations are now felt to be so powerful in other countries that they threaten the destruction of a whole batch of universities in Italy which have come down famous and honored from the Middle Ages and have sent out twenty generations of students, and are causing even the very best of the smaller universities in Germany, great and efficient as many of them are, to tremble for their existence.

There is no interest of learning, therefore, which would not be served by the greater concentration of the resources of the country as regards university education, still less is there any interest of society or politics. It is of the last importance that the class of men from all parts of the country whom the universities send out into the world should as far as possible be educated together, and start on their careers with a common stock of traditions, tastes, and associations. Much as steam and the telegraph have done and will do to diminish for administrative purposes the size of the Republic, and to simplify the work of government, they cannot prevent the creation of a certain diversity of interests, and even of temperament and manners, through differences of climate and soil and productions. There will never come a time when we shall not have more or less of such folly

as that the South and West need more money than the East, because they have less capital, or when some part of the country will not struggle for a close market against other parts which seek an open one. Nothing but a reign of knowledge and wisdom, such as centuries will not bring, will prevent States on the Gulf or on the Pacific from fancying that their interests are not identical with those of the Northern Atlantic, and nothing but profound modifications in the human constitution will ever bring the California wheat-raiser into complete sympathy with the New England shoemaker. The work of our political system for ages to come will consist largely in keeping these differences in check; and in doing it, it will need all the help it can get from social and educational influences. It ought to be the aim, therefore, of the larger institutions of learning to offer every inducement in their power to students from all parts of the Union, and were especially from the South, as that part of the country which is most seriously threatened by barbarism, and in which the sense of national unity and the hold of national traditions on the popular mind are now feeblest. We at the North owe to the civilized men at the South who are now, no matter what their past faults or delusions may have been, struggling to save a large portion of the Union from descent into heathen darkness and disorder, the utmost help and consideration. We owe them above all a free and generous welcome to a share in whatever means of culture we have at our disposal, and ought to offer it, as far as is consistent with our self-respect, in a shape that will not wound theirs.

The question of the manner of doing this came up incidentally at Harvard the other day, at the dedication of the great hall erected in memory of the graduates of the university who died in the war. The hall is to be used for general college purposes, for examinations, and some of the ceremonial of commencement, as well as for dinner, and a portion of the walls is covered with tablets bearing the names of those to whose memory it is dedicated. The question whether the building would keep alive the remembrance of the civil war in any way in which it is inexpedient to keep it alive, or in any way which would tend to keep Southern students away from the University, has been often asked, and by some answered in the affirmative. General Devens, who presided at the Alumni dinner, gave a full and sufficient answer to those who find fault with the rendering of honor on the Northern side to those who fell in its cause; but General Bartlett—who perhaps more than any man living is qualified to speak for those who died in the war—uttered in a burst of unpremeditated eloquence, at the close of the proceedings, the real reason why no Southern man need, and we hope will never, feel hurt by Northern memorials of the valor and constancy of Northern soldiers. It is not altogether the cause which ennobles fighting; it is the spirit in which men fight; and no horror of the objects of the Southern insurrection need prevent anybody from admiring or lamenting the gallant men who honestly, loyally, and from a sense of duty perished in its service. It is not given to the wisest and best man to choose the right side; but the simplest and humblest knows whether it is his conscience which bids him lay down his life. And this test may be applied by each side to all the victims of the late conflict without diminishing by one particle its faith in the justice of its own cause. Moreover, as General Bartlett suggested, the view of the nature of the struggle which is sure to gain ground all over the country as the years roll on, is that it was a fierce and passionate but inevitable attempt to settle at any cost a controversy which could be settled in no other way; and that all who shared in it, victors or vanquished, helped to save the country and establish its government on sure and lasting foundations. This feeling cannot grow without bringing forcibly to mind the fact that the country was saved through the war that virtue might increase, that freedom might spread and endure, and that knowledge might rule, and not that blackguard politicians might have a treasury to plunder and marble halls to exchange their vituperation in; thus uniting the best elements of Northern and Southern society by the bonds of honest indignation as well as of noble hopes.

Correspondence.

A CENTENNIAL MONUMENT WORTH HAVING.

To the Editor of the Nation:

Sir: At a regular meeting of the New York Genealogical and Biographical Society, on the 11th of March last, a paper was read by Mr. R. S. Guernsey 'On the Bibliography of the United States relating to Military Collective Biography,' which seems to me to merit a wider publicity than would naturally be attracted to it in the pages of the Society's quarterly *Record*.

The object of Mr. Guernsey's essay was to secure the aid of the Society, and through it the aid of every similar genealogical, biographical, and historical association in the country, to the project of "celebrating the centennial anniversary of national independence by inducing each State to publish a roll of its men, both rank and file, who fought to establish our National Government." At present New Jersey is the only State of the old thirteen that has had the justice to perform this patriotic duty. In 1871, its legislature "ordered the publication, at public expense, in convenient book form, of the official register of New Jersey's soldiers in the Revolutionary War, the war of 1812, and the war with Mexico"; and the first volume, compiled by Adj.-Gen. W. S. Stryker, was issued in the following year, while the record of the soldiers in the two later wars is still to appear. The only other extensive public list of the men of '76 is that contained in a book entitled 'Records of the Revolutionary War,' by W. T. R. Saffell of Baltimore, published in 1858. In addition to much other out-of-the-way matter, this book comprises "the names of the officers and privates of 34 regiments and of 132 captains' companies not in these regiments, as they stood at various times from the beginning of the war up to 1779, representing Massachusetts, Rhode Island, Connecticut, New York, Pennsylvania, Maryland, Virginia, and South Carolina. About 12,000 privates are named altogether. The book also has a list of about 2,500 officers of the Continental line, with the dates of death of very many of them, not only those killed in battle but those who died from natural causes in after-years." The whole number of commissioned officers of the Continental line was more than 9,000, and of the militia and State troops about 2,000; and the whole number of soldiers and sailors who fought for our independence is shown by the Pension-Office records to have been 289,715, of whom only 57,623 ever lived to get a pension.

Now, is it possible to mention a more thoroughly creditable way in which Massachusetts, New Hampshire, Rhode Island, Connecticut, New York, Pennsylvania, Delaware, Maryland, Virginia, North Carolina, South Carolina, and Georgia may celebrate the national centennial than by following the lead of New Jersey in rescuing from oblivion the names of their citizens who fought the good fight for freedom one hundred years ago? Can any minor plan be devised so effective in strengthening an honorable local and national pride than this of erecting in every library in the land an indestructible monument to the memory of the brave days of yore? General allusions to the "heroes and martyrs" of that eventful period are so common as almost to make us forget the solemn significance of those well-won titles; but where are the facilities for learning who those heroes and martyrs individually were? There probably never was another war in which the private soldiers were of so much personal importance and held so close an intellectual and social equality with the officers who commanded them. They were almost every one of them freeholders or the sons of freeholders, and their pronounced individuality was at once the greatest source of weakness and the greatest source of strength in all the military operations of Washington. Nothing less than his supreme genius could have maintained any effective discipline among such troops, and nothing less than their own thoroughgoing patriotism and earnestness could have prevented the actual insubordination and contempt for authority which existed among them from bringing overwhelming confusion and defeat in time of battle.

By all means, then, let us have some personal knowledge of these remarkable men. Bunker Hill will always call to mind Prescott, and Warren, and Putnam, and the rest; but we ought also to know the names of the "embattled farmers" who were fighting and falling with them ninety-nine years ago to-day. The story of Sullivan's Island tells us of Moultrie calmly smoking his pipe inside the little palmetto fort, and of Jasper nailing up his flag in the thickest of the cannonade; but how about their sturdy comrades who were working the guns so effectively through all the weary hours? Ticonderoga immortalizes Ethan Allen, yet who can name the other Green Mountain boys that followed him into the fort? What personal knowledge have we of the half-frozen, barefooted troopers with whom Washington swooped down on Trenton? or of the panic-stricken fellows who heard that exemplary and mild-mannered gentleman storm and swear at the traitorous

Lee on the retreat at Monmouth? or of the shirt-sleeved minute-men who rushed up to the mouths of the Hessian cannons at Bennington on the day when Molly Stark did *not* become a widow?

When justice has thus been done to the memory of the quarter of a million of patriots who fought for American independence, it will be time enough to erect a similar monument to those who have followed the flag in after-days. Their numbers, as shown by the Pension-Office records, are as follows: War of 1812, 527,654; Mexican war, 73,260; Indian wars and frontier disturbances, 1794 to 1839, about 77,000; civil war of 1861, 2,688,523. Of the *officers* who have served in the army and navy of the United States since the inauguration of the first President in 1789, volunteers as well as regulars, a complete record has been made in the works of Generals Gardner, Cullum, and Henry, of Lewis R. Hamersly, Peter Force, Mechlin, and Winder, in the annual official *Army and Navy Register*, from 1815 onwards, and in the special 'Official Army Register of Officers of Volunteers from 1861 to 1865,' published by order of Congress in eight volumes. Numerous histories have also been printed of the parts played by several of the States and by individual regiments in the recent war, though New York is the only State that has officially published the muster-rolls of all the private soldiers enlisted in her fighting regiments from 1861 to 1865. Congress, however, has published, in 25 volumes, the 'National Roll of Honor,' containing a record of more than 330,000 graves of Union soldiers who died during those four fatal years; and at some future day may perhaps be led to fulfil the duty of preserving in proper form the names of the three and a half millions of soldiers and sailors who, since the establishment of the Constitution, have enlisted in the Government's defence. At present, and while those 61,689 "pension cases" for services in the last war remain "unadjudicated," it can have no such duty.

But to the names of the heroes of a hundred years ago it is the special duty as well as privilege of "the old thirteen States alone" to render centennial honor. To quote again the exact words of Mr. Guernsey: "There are a million living tongues to plead for the perpetuation of the memory of their comrades in the late civil war; therefore I do not plead for them. I plead for the brave long ago dead—those whose now distant kindred among us seem almost to have forgotten them—the warriors for our national independence." L. H. B.

West Springfield, Mass., June 17, 1874.

Notes.

G. P. PUTNAM'S SONS publish immediately the poems of the late Charles Alanson Munger of Binghamton, N. Y. They have also in press a new edition of Dr. A. Jacobi's 'Infant Diet,' revised and considerably enlarged by Dr. Mary Putnam-Jacobi.——We have received from F. R. Wetmore & Co., Yokohama, a guide-book to the city of Yedo—'The Tokio Guide'; Yedo, by the way, being as correct a name now for the city as New Amsterdam would be for New York. The change took place on the overthrow of the Shôgun by the Mikado in 1868. Tokio signifies Eastern Capital. The guide-book is composed in a very simple, straightforward manner, without "highfalutin," and lacks only a map of the city, if such a thing is procurable. We observe that the compiler thinks he finds the Italian sound of *u* in the word *tune*.——Longfellow's 'Evangeline' has recently been translated into Portuguese by a Brazilian poet, Dr. Franklin Doria.——An Homeric Thesaurus by Mr. Gladstone, and 'Early Russian History,' by Mr. W. R. S. Ralston, are among recent English announcements. Mr. Edward Arber's proposed page-for-page transcript of the Registers of the Company of Stationers of London, between 1554 and 1640 A.D.—registers which, he says, "are to the entire Saxon race in respect to the books of our Golden Age what Domesday Book is to the inhabitants of England as to our Iron Age"—does not appear to have attracted sufficient attention in this country. At least, we read in the *Publishers' Circular* of June 2 that "not one of the twenty or more historical societies of the United States has yet subscribed." Mr. Arber's address is 87 Augustine Road, Camden Square, N.W., London. The edition will not exceed the number of subscribers, nor in any event be more than 460 copies, the price being 20 guineas (large paper, 50 guineas).——Harper & Bros. will be the American publishers of Stanley's 'Coomassie and Magdala' and Sir Samuel Baker's 'Ismailia,' or the Khedive's Egypt.——Part II. of Spruner's 'Historical Hand-Atlas' (B. Westermann & Co.) contains four maps of Europe at the following periods: in the time of Odoacer (476–793): of Charlemagne (768–814); of the restoration of the Western Empire under Otho I. (962); and from the Peace of Westphalia (1648) to the disruption of the Spanish monarchy (1700).——Hurd & Houghton announce for issue during the present month the sixth number of the Journal of Social Science, containing in full nearly half the papers read at the recent meeting in this city of the American Social Science Association, and much other matter.

—The "University address" of Governor Dix at Schenectady last week, as Honorary Chancellor of Union University, is not only in itself an admirable tribute to classical studies by a well-cultivated mind, but, coming from a man who has lived in both the senate and the camp, who in his boyhood was a captain in one of our three great wars and in his old age a general in another, and whose whole life has mingled with the active affairs of men, it must be accepted as peculiarly valuable evidence of the worth of such studies. The address in its delivery was a still more remarkable testimonial of the value of culture and the utility of classical studies in keeping the mind clear and bright and the memory fresh and vigorous. Filling about two columns of the Albany papers, and containing a number of Greek and Latin quotations, some of considerable length, the address was delivered without recourse to the written copy and without a single slip of the memory or the slightest halting or hesitating for the right word. With neither the slovenliness which characterizes many a scholar who comes before an audience to stumble over his ill-written manuscript, nor the oratorical display that mars many a studied discourse, speaking with the unpretentious simplicity that a well-bred gentleman would use in his own parlor, and uttering scholarly sentiments such as an old scholar might properly address to young ones, Governor Dix produced a forensic effect upon the young and old, the learned and unlearned, of his audience which the most of our impassioned orators might very well envy. If the young men who listened to this address will reflect that the well-prepared and thoroughly-committed sentences were spoken by a man who in 1815 was a captain in active service, and who at the time of writing and committing held one of the most laborious and vexatious offices in the country, they will be tolerably certain to supplement it with the conclusion that post-graduate culture and continuous study of the classics have been to Governor Dix among the chief blessings and enjoyments of his life, preserving in old age the mental freshness of youth, and keeping those faculties burnished and bright which in other men of his years are generally overlaid with rust. Such an illustration at the close of one's college course is no small favor, and to many a graduate may prove the directing lesson of a life.

—The death of Dr. George Derby, the late Secretary of the State Board of Health of Massachusetts, has occasioned a loss, not only to the medical profession and citizens of that State, but to the country at large, which those who have not kept pace with the recent advances in the study of hygiene will find difficult to appreciate. It is now five years since this board of health has been organized, and under the energetic guidance of its secretary it has not only put down a vast number of nuisances and instituted important reforms in sanitary legislation, but is looked up to by the public with confidence for protection against existing abuses or the dangers of threatening epidemics. The influence of its pioneer work has indeed spread all over the country, and the increased attention to sanitary matters on the part of many States, the organization of new boards of health, and the rapid increase in the amount of valuable literature on the subject of hygiene, are all largely due to the successful example which has been set by this board. Such success as this can only be enjoyed by any organization under the guidance of a competent leader, and it may be said of Dr. Derby that he proved fully equal to the task allotted to him. He was a worthy leader of a worthy band. Early in the war, he was appointed surgeon to the 23d Regiment of Massachusetts infantry, and served with distinction until the close of the struggle. It was here that he received that training which helped to fit him for the duties he subsequently was called upon to perform. But this alone was not the key to his success. To a well-trained mind there was added an honesty of purpose, an enthusiasm for his work, a firmness of character, and a personal address which inspired others to help him in his good work, and won for him the respect and regard of his professional colleagues. For the last few years he has filled with distinction the chair of hygiene in the medical school of Harvard University. The reputation of such a man is necessarily not so brilliant or widespread as that of one whose services have been of a more conspicuous character; but a slight consideration of what Dr. Derby accomplished directly by his example in Massachusetts, and indirectly by his influence on public hygiene without regard to State limits—an influence not yet spent, nor likely to be spent in this generation—shows how richly he merits the long and grateful remembrance of his countrymen.

—Third on the list of "scientific worthies" whom *Nature* honors from time to time with a steel engraving and a biographical sketch, is Charles Darwin—Charles Robert Darwin, if we choose to remember the name in full. In the issue for June 4 his portrait is given in the same style as that of Faraday and Huxley, and by the same consummate artist, Mr. C. H. Jeens, whose sympathetic interpretation of the photograph produces a result in

almost all respects superior to the photograph itself. The view is in profile. The biography, singularly enough, comes from this side of the water, from the pen of Dr. Asa Gray, whose intimate personal relations with Mr. Darwin, great admiration for his character, and general hearty belief in his doctrine, made his task an easy one. Dr. Gray dexterously portrays his subject by contrast with the late Robert Brown, they being two British naturalists who "have, more than any others, impressed their influence upon science in this nineteenth century." Their careers really offer many points of likeness, but "they worked in different fields and upon different methods; only in a single instance, so far as we know, have they handled the same topic," when Darwin, entering the field of the "facile princeps botanicorum," furnished the explanation, which Brown failed to discover, of the structure and modes of fecundation of Orchids, and announced, as the result of this and similar studies of sexual propagation in plants, the aphorism, "Nature abhors close fertilization." "To have originated this," says Dr. Gray, "and also the principle of Natural Selection—the truthfulness and importance of which are evident the moment it is apprehended—and to have applied these principles to the system of nature in such a manner as to make, within a dozen years, a deeper impression upon natural history than has been made since Linnæus, is ample title for one man's fame." Prefixed to this tribute is a list of Darwin's works, general, zoölogical, botanical, and geological; the number and variety of which are truly astonishing, and the end not yet. The oldest publications are geological, dating from 1837, the year following his return from the voyage on the *Beagle*, during which, as the reader of his delightful 'Journal of Researches' (1845) soon perceives, he had already struck out for himself those ideas which first, in 1859, were given to the world in a matured shape, and have since come to be universally known as "Darwinism." It is curious to observe that the author of Natural Selection married his own cousin.

—In the *Geographical Magazine* for June there is a fair-minded and apparently accurate analysis of the statistics of Roman Catholicism in Great Britain. The writer, Mr. E. G. Ravenstein, is prompted to allay the apprehensions manifested in certain quarters concerning the apparent growth of Romanism in the kingdom. He begins by showing that from constituting above a third of the population of England and Wales in Queen Elizabeth's time, the Catholics, owing to the penal laws, had declined in 1699 to a little more than a half of one per cent. (0.54), and though they rose in 1769 to 0.97 per cent., in 1778 they numbered only 0.89, and remained stationary or diminishing to the beginning of the present century. After Irish emigration had begun to set in, the percentage reached 1.07 in 1844, and was speedily driven up by the famine, the highest being reached in 1863, when there were 5.09 Catholics to every hundred inhabitants. Since that date there has been a steady decrease (to 4.02 per cent. in 1872). In Scotland, the year of maximum strength was 1865 (10.16 per cent., against 8.89 per cent. in 1870). Mr. Ravenstein's calculations purport to show that this falling-off has been due not wholly to emigration but largely to secessions from the church. We have only space for his conclusions. Passing on to the subject of the distribution of Roman Catholics, he finds that 36 per cent. of them live in Lancashire, and the larger numbers in the big towns, though London contains only 131,000—about four per cent. of the population. As for their church accommodations, provision is not so bountiful as it was twenty years ago. In England and Wales, there is one priest to every 580 Roman Catholics, and one monk to every 1,490. Mr. Ravenstein's paper closes with a tabular summary of the foregoing statistics, and is accompanied by a colored map showing the distribution of Roman Catholic chapels, convents, and monasteries.

—Conservative people who are disturbed at the agitation of a certain well-known question may take courage from a discovery recently made by the editor of the London *Academy*. It is to the effect that, although we are within a few months of the last quarter of the nineteenth century, and still see woman to be in a gratifying state of subjection and suppression, she was in active revolt in London so long ago as 1780, and so long ago as in 1789 had flung to the breeze the most advanced standard which floats to-day. The consolatory aspect of the discovery, of course, is that if woman has accomplished so little in the eighty or ninety years just gone, she may for the next eighty or ninety also be reasonably expected to continue to fight as one that beats the air; and may in 1964, as now in 1874, still be proving in the *Woman's Journal* that as the anti-slavery reformers succeeded, although at first they were but a small, contemptible band, so the woman's suffrage reformers are sure to succeed because they also are a small, contemptible band. In 1788, on the occasion of "the opening of Rice's elegant rooms, Brewer Street, Golden Square," the editor finds that there appeared in the *Morning Post* an advertisement of a public debate, to be conducted by ladies only, at which the first subject set down for discussion was the following: "Do not the extraordinary abilities of the ladies in the present age demand academical honors from the Universities, a right to vote at elections, and to be returned members of Parliament?" We suspect the hand of Rice himself in this announcement; but it is to be presumed that he knew what would attract the ladies of that age with their extraordinary abilities. On the 14th of April, 1780, there was established at the Casino, No. 43 Great Marlborough Street, a Ladies' Parliament. The first question here discussed was as follows: "Is that assertion of Mr. Pope's founded in justice which says 'Every woman is at heart a rake'?" It is, perhaps, worth while to note that the movement seems then, as now, to have had the effect of calling into activity some disciples with a talent for airing problems which they had better leave alone. This problem the Great Marlborough-Street Parliament appears to have discussed at some length. It is not till Friday, April 21, that we find this ruling: "The speaker having taken the chair, it was resolved, *nem. con.*, that the assertion of Mr. Pope's, which says that 'Every woman is at heart a rake,' is not founded in justice." On the same date, "a member presented to the House several petitions from men-milliners, men-mantua-makers, and so on, against a bill entitled an act to prevent men from monopolizing women's professions." But the natural proclivity of parliamentary or other business to lapse into trivial lightness and frivolity, when long entrusted to the management of a certain variety of human being, soon shows itself in the history of this Parliament. As early as in March, 1781, we meet with this report: "The opening of the budget, and the debate which ensued on the taxes proposed by the female premier, afforded such high amusement to the numerous and splendid company in the rooms, that a general request was made that on the subsequent Friday the ladies should resume the consideration of the budget in preference to the question given out by the chair." These were some of the taxes proposed by the female premier: A tax on old maids and old bachelors over a certain age; a tax on monkeys, lap-dogs, butterflies, parrots, and puppies, including those of the human species; a tax on made-up complexions. About this time, too, the explorer finds that a large gathering were engagad in pursuing the following useful enquiry: "Which is the happiest period of a man's life: when courting a wife, when married to a wife, or when burying a bad wife?" The result of the investigation seems not to be known.

—In a little volume, printed for private circulation, called 'Some Particulars of the Life of Samuel Rogers,' by his nephew Samuel Sharpe, in speaking of the notes appended by Rogers to his poems, Mr. Sharpe says: "These were written most carefully; every word was weighed and reweighed; he bestowed as much time upon them as upon his verse, and thought them equally deserving of such care. The piece in which he thought himself most successful is the ten lines which describe the old friar's remarks upon the picture of the 'Last Supper' in the dining-room of the convent. . . . This anecdote was told to him by Wilkie the artist, and it has been repeated in verse by Wordsworth and Monckton Milnes, and in prose by Southey. The *North American Review* for July, 1842, compares together these four versions of the same story, and justly gives the palm to that by Mr. Rogers." The familiar story in Rogers's version of it (we copy from the *North American Review*) is as follows: "'You admire that picture,' said an old Dominican to me at Padua, as I stood contemplating a 'Last Supper' in the refectory of his convent, the figures as large as life. 'I have sat at my meals before it for seven-and-forty years, and, such are the changes that have taken place among us, so many have come and gone in the time, that when I look upon the company there, upon those who are sitting at that table, silent as they are, I am sometimes tempted to think that we and not they are the shadows.'" This is certainly a finished piece of prose, excellent in conciseness and measure, but still capable of improvement. "I am sometimes tempted to think" is not the precise phrase for its place, nor are the figures in the painting "shadows." In this last particular Southey's version in "The Doctor" is nearer right. "I sometimes think they are the realities and we but shadows." But this story is not to be found in the notes to the illustrated edition of Rogers's 'Poems' of 1834, nor of the 'Italy' of 1836. Nor is it in any of the earlier editions in which we have looked. Can any of our readers tell us in what edition it first appeared?

—M. Beulé, whose recent death has taken from France an excellent archæologist if but a poor statesman, in his 'Histoire de l'Art Grec avant Périclès,' cites two verses concerning the roses of Pæstum from the 'Jérusalem délivrée' of Tasso—

> "Quindi insieme venia la gente esperta
> Dove sol che abbonda di vermiglie rose."

The verses are plainly misprinted. The same verses are cited by M. Lucien du Bois in his recent entertaining though shallow 'Lettres sur l'Italie et ses Musées.' He gives them as follows:

> "Qui vi insieme venia la gente esperta
> Dal suol che abbonda de vermiglie rose."

Here too are obvious misprints. M. du Bois says: "Le Tasse conduit les

gens de Pæstum au siége de Jérusalem." But we question this fact, and doubt whether these verses are to be found in the 'Gerusalemme Liberata.' Whence then do they come?

—As supplementary to our notice of Rich's 'Dictionary of Roman and Greek Antiquities' in No. 466, perhaps we ought to have mentioned as a defect that the author appears to take no notice of Etruscan discoveries as throwing light upon earlier Roman and Greek life. The occasion for making note now of this deficiency is an article published in No. 19 of *Im Neuen Reich* by Wolfgang Helbig, 'Ueber die Frauentoilette bei Homer.' Greek art at its highest point of development, and modern artists, Flaxman, Genelli, and Preller, represent the Homeric women in the costume, somewhat idealized, of the time of Pericles. Pointing to an Asiatic style of dress as more probable is the circumstance that Homer, when mentioning objects of art and garments as especially noticeable, usually says that they are of Phœnician workmanship or of Phœnician derivation, showing that in his period Phœnician or Eastern workshops furnished these objects or the designs followed in making them. Etrurian art went through the same order of development as Grecian, though Asiatic models influenced Etruria longer than Greece, since traces of Asiatic influence in Etruria are observed all through the fifth century B.C. Helbig, resting on these facts, undertakes, from paintings on walls, from bronze and terra-cotta figures, and ornaments found in the oldest graves of Cære and Tarquinii, which are indisputably of Phœnician workmanship, to reconstruct the dress of Homer's women, justifying his conclusions by passages from the poet. His article is accompanied by a plate representing a woman clothed from head to foot, and with some of her ornaments pictured separately. Her dress, open in front to the waist, is fastened by fibulæ; the sleeves half cover the arm. In the typical female dress, as we do not need to say, the chiton is fastened at the shoulder. Round her neck is a necklace of gold and oval pieces of amber set in gold, the amber having a long diameter of about six centimetres (Helbig, differing from Mr. Gladstone, thinks Homer's *elektron* to be more likely amber than an alloy of gold and silver, and says that the contents of the oldest Etruscan graves confirm him in this opinion). The ear-rings found in these graves agree remarkably with Homer's constant epithet for these ornaments, *triglenos*, "with three eyes," or "with three apples of the eye"—disc or lens-like figures. The head-dress which the figure wears is not the low cap of the best period of Grecian art, but a high covering for the head, resembling the so-called *tutulus*, and suggesting the tiara of the king of Persia. The *plekte anadesme*, whose meaning has hitherto been obscure, Helbig identifies as a band of strips of cloth wound together in a peculiar way and connecting the low cap closely fitting the head with the high crown. Neither the dress nor any of the ornaments here described is represented in Rich. Passing over other details noticed in his article, the general impression which Helbig's picture of the Homeric woman makes we give nearly in his own words. He has imagined a German professor transported to the house of Menelaus in Sparta. Awaiting the appearance of the queen, he expects to admire a genuine model of Greek beauty, the classic form in the classic dress. But instead he sees a woman far more like an odalisque of King Hiram of Tyre or one of the wives of Solomon than the Athenian woman of Pericles's day. One may doubt whether our critic is quite right in his conjectures as to the personal appearance of a woman so noted in poetry as Helen; but his suggestions deserve attention, as probably also will the book which he promises, and in which he will aim to show in detail the connection of Etruscan art with Asiatic. We may add that in No. 11 of *Im Neuen Reich* favorable mention was made of the book by Helbig, published at Leipzig last year, 'Untersuchungen über die campanische Wandmalerei,' whose object was to prove that Roman art owes its impulse to the influences prevalent in the time of Alexander and his successors, and to define those influences.

—There has been a remarkable degree of interest manifested within the past year in the 'Germania' of Tacitus, no less than three elaborate treatises having appeared in Germany and one in France with this classic for their text. The French work is by M. Geffroy, a republication, under the title 'Rome et les Barbares,' of a series of essays in the *Revue des Deux Mondes*. It is one of those books which are eminently characteristic of French scholarship, in which the results of recent investigations are presented thoroughly and accurately, as well as vividly; very readable, and very suggestive and instructive. The works of German scholars have been studied to good purpose, and the book is distinguished throughout by the sound and impartial judgment which we commended in the last of these papers a few months ago (*Nation*, No. 435). Probably no other contains so good a view of the present state of scholarship in this field adapted to general readers, but well deserving the attention of scholars as well. As the name implies, the 'Germania' is only the central feature of the book; its plan covers the entire field of the intercourse of Rome and the Germans from Cæsar to Chlodwig. Of the three German treatises, the first is a posthumous publication of lectures by Dr. Holtzmann of Heidelberg; it is edited by Dr. Holder under the title 'Germanische Alterthümer,' and has the work of Tacitus with a tradition prefixed. The most important special feature of this edition is the theory that the Germans were Kelts, while the Britons were not—a theory which, the author says, used to be the accepted one, but has been superseded by the present one, developed especially by Amédée Thierry, which combines the Britons with the Gauls under the name of Kelts. Another prominent feature is his holding that the *principes* of the 'Germania' were nobles, in opposition to the generally-accepted view of Waitz that they were elective magistrates. The second work is 'Germania Antiqua,' by Müllenhoff, the chief living authority on the subject of German antiquities. In this work, however, he has not presented the results of his special studies (which are given in his great work, 'Deutsche Alterthumskunde'), but has undertaken simply to collect a mass of materials, as Jacob Grimm and Latham did in their editions of the 'Germania'—a complete collection of whatever the ancients have left upon the subject of the Germans. The largest and most important of the three works is 'Urdeutsche Staatsalterthümer,' by Prof. Baumstark of Freiburg. The high reputation of the author and the size of the book (its price is 7 thalers 10 groschen) will make this no doubt the standard edition of the 'Germania' for thoroughness and exhaustiveness.

RECENT NOVELS.*

IN 'Tempest-Tossed' Mr. Theodore Tilton makes his appearance as a writer of fiction, following Jules Verne more than any other master in the construction of his story. The plot is an ingeniously crazy one. Dr. Vail and his young wife are on board of the *Coromandel*, a stoutly-built ship, bound for Cape Town, and when within a few hundred miles of their journey's end the ship is set on fire by lightning; in great alarm, the captain with the passengers and crew abandons the vessel, leaving Dr. Vail by the side of his wife, who is lying in a fainting-fit, which her husband mistakes for death. As soon as the captain is out of sight, the rain falls, puts out the fire, which was only burning the rigging and outside of the hull, and Dr. Vail finds himself floating on the South Atlantic Ocean in a sound but unnavigable hulk. In the midst of all the confusion his wife gives birth to a daughter. Fortunately for this deserted family, the ship has on board a full cargo of canned meats and vegetables of various sorts, enough to supply the doctor and family with food for twenty-six years. In this floating pantry they are kept drifting about the seas in a region of calms which is shunned by sailing-vessels, and as fast as they reach one edge of it they are driven back into it by adverse winds. This goes on for several years. The daughter grows up, and by hearing a great deal of her family's friends manages to fall in love with a young man of suitable age, who by a singular coincidence refuses to believe that the *Coromandel* is lost, and has himself fallen in love with the "tempest-tossed" Barbara. When about one-third through the book, the reader begins to feel sure that the Vail family will reach land when the proper time arrives for Barbara to "come out." All of the rest of the story happens as it should, though with more incident in the way of earthquakes and sea-fights than need be told here. Jules Verne, in his wildest flights into space, is a sober writer of possibilities, and even high probabilities, in comparison with Mr. Tilton. As for the style, it is the impossible mock poetical. Here is the soliloquy of the young lover when he finds the hull of the *Coromandel*:

"And this is the *Coromandel!*—this the day-dream of my life!—this the Holy Grael of my father's search and mine!—nothing but this old piece of mildew and mould! . . . What fate, then, has befallen Rodney Vail? Where is the original of the face that I carry with me in the picture? And, oh! where is the unknown maid who was born in that black hulk? *That* was her cradle then? *That* was the dingy mansion in which she dwelt! *That* was the prison-house and black barrier that kept her from the world—and from me! Oh! to think that a few thin and rotten planks—a mere

dank wall of decayed timber—should have been permitted by heaven to incarcerate the fairest of maidens from the sight of all earthly eyes for a lifetime! Burn! rot! sink! O dismal dungeon that has so long kept me from my love—from my soul's self! Why does my heart beat so?" etc., etc., etc.—

all as fine as a beggar on a holiday. There is an insipid artificial flavor about the whole book which is not due to the canned fruits and vegetables alone. But it may please the natural public of this writer.

'Some Women's Hearts' is the rather appropriate title of Mrs. L. C. Moulton's little volume of short stories, many of which discuss some problem of morbidness in a way which is tolerably certain to find a certain number of readers. In the first story we have the young woman of Lenox, Mass., who falls in love with the gifted, rich, fascinating, but cold Mr. Le Roy. They marry, and she is very unhappy; she runs away to Paris and supports herself by teaching English. Another man appears; he thinks she is a widow, and makes love to her; she tells him she is a married woman, and persists in refusing him. In time, however, her husband dies, and she marries her former friend. The woman herself is not ill described, with occasional clever touches, but the story is in no way deserving of commendation. In 'Twelve Years of My Life' it is a married man who dislikes his wife, and so makes love to the unprotected young woman, and she finds employment with the deserted wife, and, aided by the death of one of the children, she reconciles the parents. They wanted her to stay.

"Should I accept all this? Was it not too pleasant to be safe? Was not its very sweetness dangerous? Could I answer for my own heart? Was I sure that I could live for years under the same roof with Andrew Lincoln and never think of hours whose perilous happiness duty bade me forget for ever? *He* might be safe. Katherine was beautiful, and she loved him; but where was the fine-linked armor with which to shield my woman's heart?"

This is nice. Mrs. Moulton should know that it is not enough to say that such things happen in real life, that often people fall in and out of love when and where they should not. It makes the narration of such incidents no less offensive, and it becomes unnatural when what is usually and properly kept hidden is forcibly thrust upon our attention without a shred of modest reserve, as something claiming our best sympathy instead of our pity when it is endured, and our profoundest contempt when it is made much of. The writing of such books may best be left to divorced women of dubious reputation. The other stories are less dangerous, but in all there is the same inability to see things in their proper relations.

Even the socialist has so far bowed down to custom that he has joined the abolitionist and the woman's-rights advocate and the temperance-preacher, and in fact most people with hobbies, and written a novel in support of his views. The inflationist will be the next to come, we suppose. It is not easy to follow the tangled thread of 'Ca Ira.' Besides its title, there is a good deal of dark mystery in this silly book. College secret societies, the Ku-klux Klan, the Commune at Paris, appear in turn, with the same grimness about each, and a liberal measure of vulgarity. There is occasionally a degree of vividness in the story which makes us regret still more that the enthusiasm of the young radical led him to publishing it; if he pretends to be anxious for the emancipation of labor, he can help the critic to this by laying aside his pen.

'A Daughter of Bohemia' is the title of the latest novel of Christian Reid, a writer some of whose previous books we have already had occasion to notice. One or two of these showed, as we mentioned at the time, greater merit in certain particulars than was borne out by the novel as a whole; in 'A Daughter of Bohemia,' however, there is a great improvement. The story is well told—indeed, this is a point in which the novel shows very decided merit; the characters are something like real people, instead of being lacquered imitations with lustrous eyes and sonorous names and one emotion; the plot is not a bad one; and the reader's interest is kept up from the beginning to the end of the book. The two young half-sisters, Leslie Graham and Norah Desmond, are well drawn, the one ladylike, gentle, trusting, and dignified, the other, in spite of some exaggeration, clever and at heart kindly. These two young women are the best part of the book. Very nearly as good is the gossiping widow, Mrs. Sandford. While the two sisters are intelligently discriminated, there is to be noticed too little variety about the cleverness of the other people; whenever a sharp thing is to be said, it is said by one in just the same way as the others would say it; but in other respects the different characters are not confounded. Her novel will be gratefully received by the summer-idlers, who will do well to read it.

Mr. Trollope's 'Lady Anna' is not one of his most successful novels. Like many of those in which this writer attempts to give us something more than an uneventful tale with a moderate amount of passion and a photographic picture of life, this one fails because the author is incapable of representing serious emotion. The ordinary love-making of juxtaposition he does with the amount of skill all his readers are familiar with, but the narrowness of his range is to be seen as soon as he tries to fly higher. In 'Lady Anna' we have a young woman of high birth, who has been kept out of her own by the misdeeds of her father, coming finally into possession of an enormous property. She has already engaged herself in the time of her obscurity to a young tailor, and the book is made up of the attempts of a doll-like earl, a cousin of hers, to marry her and so get money enough to maintain his title. All of Lady Anna's friends and relatives urge his claims; but she keeps to her word, marries the tailor, and makes over a large share of her money to her cousin—for Mr. Trollope always has a large unclaimed fortune in his novels for the consolation of young heroes crossed in love. We are threatened with a description of the married life of the tailor and his bride; we hope to escape it, for two more uninteresting people than they both are it would be hard to find in all Mr. Trollope's novels.

It is a misleading use of language to call Auerbach's 'Waldfried' a novel; it is, rather, a fictitious history of the politics of Southern Germany from a date a few years earlier than the German-French war till the year 1871. This history is illustrated by different events in the life and experience of a very large family, all of which are recorded in the diary of the father, father-in-law, grandfather, and (before the book closes) great-grandfather, Heinrich Waldfried. Evidently, the intention of the author was to write a story which should stand as a representation of German life during some of the most interesting periods of later history. To include the whole of Germany would of course have been impossible, and he wisely made choice of that part with which he is most familiar, and where certain German characteristics are more prominent than in the Northern countries. Another German novelist, Mr. Spielhagen, has already called attention to the possibility of Auerbach's story disseminating among foreign readers false notions of the ways and manners of his people, and it is with a certain contempt that he speaks of the patriarchal simplicity of the Waldfried family. It is very different from the reserve and stiffness of North Germany; but if the reader will take for granted no more than the author states, he will understand that he is reading an account of but one section of Germany, and ask for nothing more. It is with considerable ingenuity that Auerbach has managed to bring in various representatives of German interests out of his single family. One son had fled to this country after the troubles of 1848, another is a professor, and gives us the views of the learned class, and the youngest, who deserted his colors on account of the fratricidal nature of the war of '66, dies fighting bravely in 1870; one son-in-law is an officer in the army, one daughter is living in Alsace, and they are all brought in in a way that keeps them continually before us. The writer of the diary himself plays a very important part in what is going on; he is a member, first of the Frankfort Parliament, then of that of Würtemberg, in which country the scene of the story is laid, and finally is one of the South German representatives in Berlin when the country is finally united. Fully to enjoy this novel, we should think it necessary either that the reader be a German, or that he have a more or less definite comprehension of recent German politics. He should read intelligently what is said of the commotions of '48; he should understand the divisions of Germany in '66, and the uncertainty that existed about the conduct of the Southern States at the beginning of the last war, or he will find the novel exceedingly tedious. Starting, however, with the proper amount of information, he will find a great deal in which he can take pleasure. It will be a very different feeling from that one gets from reading any favorite novel, say one of Thackeray's, or George Eliot's, or Victor Hugo's, or Turgenef's; it is, rather, a slippered, easy sort of comfortable enjoyment of an old man's prattle about half-familiar events, in which we forgive monotonous details about saw-mills and land improvements and family life in consideration of the recounter's sincerity and occasional pathos. Everywhere, indeed, in the book is to be noticed the pathetic patience of an old man who has seen a great deal without being soured, who has learned considerateness.

A certain respect is paid to the taste of most novel-readers by the introduction of Martella, a mysterious half-gipsy girl taken into the family from the wildwood where she had been living when the youngest son announces his engagement to her. She is of the *Mignon* type; at first there is a certain amount of interest to be felt in her bright, uncultivated remarks, but when as time goes on she is still eccentric without reasonable ground, she becomes artificial and tiresome. The other characters are for the most part clearly defined and distinct; there is no especial vividness about them, but when one has once learned to know them by name—no easy task—they can be recognized as ordinary types. It will be readily understood, however, that it is not for any marked merit of what is called character-drawing or for any dramatic skill in telling the story that the novel may be liked—the absence of these qualities will absolutely condemn it in the estima-

tion of a great many—but that there is a way of chanting the success of Germany which will be grateful to those who are pleased with that song; those who are not will have plenty of fault to find. They can call the story tedious, they can laugh at the saintliness of Waldfried, as if any one except Rousseau, Lord Byron, and Pepys put down his faults in his diary, or they can sneer at the innocent good-nature of the Germans; but those who care for the book will be very well satisfied with its simplicity, the tenderness of the sad parts, and the evident and manly pride in the patriotic part. It is unlike any book we ever read, but it is better by far than a great many which will be more popular.

'Lois Carrol; or, Her Two Selves,' is a remarkable work. A fair opinion of it may be formed from the following soliloquy of the heroine:

"Sometimes on those pleasant days spent in the library, where she was the happy monarch of all she surveyed—namely, the book-cases and easy rocking-chair—she would say: Now, Lois, select your book, and we'll have what Mrs. Hoffman calls an *intellectual feast*. Here is an abundance of viands to tempt your appetite; so help yourself, my dear. Here are Dickens's works; what part does he play in the feast? I think I will have him for my Worcestershire sauce; Thackeray shall be my pepper, George Eliot shall be my salt, and the historians are my bread, only I am naughty enough to think bread commonplace, and not to take it when I can get cake. Here is Sir Walter Scott, who is my pound-cake, and Bulwer my sponge-cake, not quite so heavy as pound-cake. Shakspere is my fruit-cake, made up of a great variety of rich ingredients. It can be kept for any length of time, brought out on any occasion, and so long as a piece remains it is good. Alexandre Dumas I think should be the wine of the feast, because he gets into the head and intoxicates—the reason, I suppose, that Mrs. Hoffman objects to my reading his works. Victor Hugo is a stronger wine and of much finer quality, but if taken in large quantities is apt to give one delirium tremens. Now for the sweet things: here is Moore, who is my honey, culled from the sweetest flowers that grow in 'Araby the blest'; Owen Meredith, my strawberries and cream; Tennyson, my bunch of rare grapes, delicate, luscious, and pure—my favorite fruit. Byron would have been a rich, ripe peach, only it was dipped in brandy, and so became a brandy-peach, spoiling it for my liking, though many persons seem to prefer peaches that have been through the process."

To adopt the same sprightly method of criticism, it might be said that 'Lois Carrol; or, Her Two Selves' is the "soda-cracker" of the novels we have before us to-day.

In 'Spring Floods' those who know Turgenef only in an English dress have the translation of what, for it is the last, is perhaps the best of his novels. Like many that he has written, it is a painful story; the tragedy it describes is of the most melancholy sort. Sanin, the hero, a young Russian twenty-one or two years old, happens to be detained in Frankfort on his way back to Russia from Italy, and just as he is about to leave that city he goes by chance into a *café*, where he finds a family in great anxiety over a young boy who is lying in a prolonged fainting-fit. He manages to bring the boy to his senses, and the others, who are Italians, in their gratitude will not let him go. He spends the evening, and, having missed the diligence, he very willingly consents to spend a few days in the city. The daughter of the house, Gemma by name, is engaged to another man; but Sanin, fearing no danger, goes about with her a great deal, and soon manages to fall in love with her, and she with him. A quarrel with some officers, ending in a duel, in which Sanin makes a much better appearance than her betrothed, gives her an excuse to throw the last-named over and to accept Sanin. He, in order to get money enough to settle in Frankfort, goes reluctantly to Wiesbaden to sell his estates in Russia to an old school-friend of his who is there with his wife. It is with wonderful beauty that this first part of the story is told; nothing could exceed the delicacy with which Turgenef describes the young man's ardor and the modest pride and reserve of Gemma. He leaves her, without dreaming of the possibility of any mischance, for merely a three days' absence; but in that time his friend's wife, a beautiful and voluptuous coquette, and worse, manages to make him interested in her and to win him as her lover. He despises her, but he cannot escape her snare. He is unable to return to Gemma. She, however, does not die of a broken heart; she marries some one else a few years later, while Sanin drags out a miserable, remorseful, broken existence.

No analysis of this sort can give a fitting idea of the merits of the story. What we have said of it may read as if 'Spring Floods' were some ordinary French novel; but in point of fact this story is elevated above such works by the great and touching beauty of the innocent part and the solemn impressiveness of the rest. No adjectives can do justice to its vividness. It is a chapter out of life; and the lesson it teaches is the lesson of life. In that way the novel is both natural and moral.

In the same volume with 'Spring Floods' is contained a shorter story by Turgenef, 'A Lear of the Steppe.' This is one of his numerous sketches of Russian character, of which he has always been a careful student. Its name vaguely tells the story, which is powerful, but, on the whole, not one of his most successful writings. It will serve to show another side of the talent of this remarkable writer, but it also is an example of a frequent tendency of his—that, namely, of being too painful. It presents in the gigantic figure of the father a striking image and illustration of that almost demoniac wilfulness which generations of unquestioned authority engendered in the Russian nobles; and in the two daughters we see the worthy Regan and Goneril of this Lear. Cordelia he has none. An indescribably baleful fascination they exert, the one in one way, the other in another.

'The Heir of Malreward' is a novel in some ways of considerable merit; but the subject is a very odious one—the effort, namely, of a disreputable father to bring his son and heir down to his own abject level; and since there is very little slurring of offensive details, we have a book which few will care to read. To be sure, the son manages to withstand the coarse temptations and brutal treatment which he continually meets, and there is some relief to the general hatefulness of the characters in the person of his uncle, who is admirably drawn; but, on the whole, the book is filled with a black unwholesome cloud of sin. What makes it worse is the air of truthfulness about it all; the story is very naturally told, many of the people seem very lifelike. There is enough cleverness in it to make us wish it had been devoted to some more agreeable task; novels are read in some measure to secure forgetfulness of just such incidents as make this story, and the reader is disappointed at finding what he is most anxious to avoid when he is seeking amusement and relaxation.

'Elena,' on the other hand, does not offend in this way; it is precisely the regulation novel, with its hero thrown from his horse in front of the dwelling of the young and lovely heroine; their love-making; his sudden and unaccountable departure without giving a sign and with the explanatory letter he wrote detained; her opposition to marrying a man who is strongly recommended to her, but whom she has never seen, and who of course turns out to be the former lover, now a marquis, whom she marries. A beautiful but coquettish step-sister steps in and sows dissension; finally, however, there is peace. The scene of the story is laid in Italy, and while there is nothing noticeably new in the first part, there is to be found in the end an account of the sufferings of the Italians who were struggling for liberty which is more impressive and interesting. From being a rather ordinary novel of society, it rises to something almost tragic.

THE MAGAZINES FOR JULY.

THE Shakspere mask, about which so much has been said since Mr. Page began work upon it, is made the subject of an article in the July *Scribner's*. It is by Mr. J. S. Hart, who evidently has laid hold of nearly all the extant information on the subject, and who presents it with clearness, but some of whose fingers appear to be thumbs. For example, we have heard a great deal of Mr. Page's interesting talk on this subject, and we listened to his lecture, but we have never supposed him, as Mr. Hart here supposes him, to assert that the scar which he finds on Shakspere's forehead just above the right eye was originally so deep as "to extend even to the brain and show actual loss of a part of the brain." The only foundation that we can think of for such a statement is that Mr. Page has always maintained that the scar which he discovers was made by a wound that was of sufficient importance to affect somewhat the osseous growth of that region of the forehead on which it was inflicted. That the brain itself was affected Mr. Page has never, as we understand it, asserted or believed. This is worth mention, because, rather unfortunately, throughout all the discussion of the mask too much has seemed to be made of this scar. Mr. Page's own emphasizing of its importance, by insisting that Shakspere specifically refers to it in one of the sonnets as the mark which "vulgar scandal stamped upon his brow," did much to bring it into undue prominence, and many persons who might have been convinced of the mask's authenticity by the delicate but numerous and intercorroborative details of proof which the artist's peculiar perceptive powers have brought together, would do nothing but laugh at the evidence from the poems. We mention Mr. Hart's statement in reference to the scar for a second reason, and that is that within a very short time some additional evidence bearing upon it has been brought to light. We run the risk of making some errors in attempting to give an idea of this evidence, but it is worth while to venture: Mr. Halliwell, the English Shaksperian scholar, recently picked up an engraving of the Droeshout print, which he at once saw to have been made from the plate before it had been recut. Of this engraving photographs have been taken, and one of them which has been brought to this country we have seen. Any one may learn by brief comparison of the ordinary copies of the Droeshout with this photograph that in the ordinary copies the eyebrows have been worked over by the engraver and made more regular—"idealized" we may say, as some artists conceive of idealization. In the photograph they have

a more individual character; in fact, there is a distinct individuality belonging to each, for the left one has in it a sort of eddy which the right one has not. This same individuality Mr. Page discovers in the mask. And as for the scar on the forehead, it is plain to be seen in the Halliwell Droeshout, except that the forehead of the picture, being out of the focus of the camera, shows more dimly than the lower part of the face, and the mark—scar or whatever it is—is fainter than it otherwise would be. Obviously this evidence, if needing to be sifted like other evidence, is yet not of a character to be slighted. As we have said, Mr. Hart has gathered together a great deal of information on this very interesting topic, some of which is new, having been got from Professor Owen and from Dr. Becker (the surviving brother of the gentleman who discovered the mask) by Mr. Hart himself. Some of it is not new, but it is all well arranged and handy, and will be the cause of attracting more general attention to the mask than it has hitherto had in this country. Many of the public are better informed, but many of them, too, are so ill-informed in this matter as to know only that the British Museum would not purchase the mask of Mr. Ludwig Becker; that Mr. Page with native enthusiasm has spent many thousand dollars' worth of his valuable time in reproducing it from photographs; and finally, that the resultant portraits of Shakspere which he has painted from it have not pleased the critics. As regards this last matter, we may say that it is not for us to speak of the art critics of New York or of Boston or indeed of our country generally, at full length and as their merits deserve, nor do we trench without fear on their province; no one therefore need feel bound to accept our private opinion, which is that the face as given in Mr. Page's mask, and in nearly the same degree in the paintings, is a wonderfully fine one, and an adequate one, and singularly true to the real character of such portraits of the poet as we have. This same part of the public will learn with some surprise from Mr. Hart that Professor Owen informed him that could the one fact be established that there ever, in the early part of the reign of James the First, was a Kesselstadt in England, "there is hardly any amount of money which the Museum would not have paid for the treasure." And the late Baron Pollock, weighing all the testimony adduced, said: "If I were called upon to charge a jury in regard to this point, I would instruct them to bring in a verdict for the claimant."

Other articles in *Scribner's* are Mr. Edward King's "Notes on Missouri"—a marvel of a State in its riches and its rapid growth; more of Jules Verne's tiresome writing, with its mechanical inventiveness and its want of imagination; and, finally, some rather unorthodox theology by a Congregational clergyman.

A writer in the *Catholic World*, desiring a brief colloquy with Dr. Büchner, procures it in a pleasant manner. Dr. Büchner, by the way, some of our readers may not know; but others will have heard of him as a singularly wise being who, not long ago, was lecturing in this city to little knots of speculative people. We believe the usual order was for him to prove in all form that neither he nor any of his audience had any immortal souls, and that they would all die like brute beasts. Then, when he had finished, the audience would shake hands with each other and congratulate themselves that they were going to die like beasts. The *Catholic World* writer has read one or more of this apostle's books, and, as we say, has formed a wish for a colloquy with him. "We have thought," he says, "of putting the whole discussion in the form of a dialogue between the Doctor and ourselves." The welcome in store for him when the curtains are drawn and the candles lighted, and the eagerness of Büchner to enter the library, may be judged by the remark made next after the one we have quoted: "We know that a lengthy conversation with such a sworn enemy of the truth may prove disgusting in a high degree, as he will utter nothing but sophisms and blasphemies"—which, indeed, is what the party of the second part usually utters in polemical controversies arranged as this one is. "Only a mason of the blackest dye," our author tells us in another place, "could have displayed such cool effrontery, artful dishonesty, and diabolic malice as Büchner"; and when he gets Büchner himself in presence, it is thus that he opens the conversation: "Indeed, Doctor, I fear that your 'Force and Matter' has made you a bad reputation. Our most esteemed philosophers say that you are a sophist, and that a man of your attainments cannot be a sophist but by deliberate choice. They evidently imply that you are a knave and an impostor." Büchner, now thoroughly at his ease, enters into the discussion with spirit, but the weakness of his argumentation is soon apparent, and his opponent bids him good-bye for the present with the remark: "I trust I have sufficiently exposed your intellectual jugglery to let you see that you are at best a charlatan, not a philosopher."

"The Relatio Itineris in Marylandiam" is a synopsis of the narrative of a journey into Maryland in 1663. It has some interest, but not much. The oft-repeated tale of the greater religious tolerance exhibited by the Catholic founders of Maryland than by the Puritan settlers of the North is once more told, but it is not suggested that Catholic gentlemen founding a royal colony of the Protestant realm of England would have soon been in a nice mess had they excluded their fellow-subjects of the Reformed faith. The truth is, religious toleration in those days was always begotten of force, or the apprehension of force, which comes to the same thing, and modern boasting about it is not very useful nor very truthful. Some of our readers will be glad of a long review entitled "Anglican Orders," in which that uneasy subject or its ghost is treated of from the point of view of Estcourt's late book. We can still praise Mr. De Vere's "Antar and Zara," and there is also a translation by Dr. Parsons of the Fourteenth Canto of the "Purgatorio."

Like several of the other July magazines, *Harper's* is readable and seasonable. Some, however, might doubt the seasonableness of this story, which we take from the "Drawer":

"A few years ago, when General N—— was making an active political canvass in the Territory of ——, then on the eve of its admission into the Union as a State (he was then Territorial Governor), he was confronted by an opposition which had small respect for the amenities of debate or the conventionalities observed in more cultivated communities. At Sandy Gulch, where a meeting was to be held, there appeared in the crowd opposed to him a rough, pestilent, desperate fellow, named M'Guire, puffy with pistols and things, who was bent upon trouble, and meant, if possible, to break up the proceedings. In General N——'s following was a 'gentleman' named Taylor, equally ready for similar work, and thoroughly devoted to his chief. At the opening of the meeting it became evident that M'Guire had inserted into his noble form just enough whiskey to be reckless. As things went on he became more and more offensive, until the General's friend came up and whispered in his ear:

"'General, hadn't I better kill him?'

"'Oh! no,' replied the General, 'that wouldn't do. I couldn't sanction any violence, much less a murder; *but*, if any little thing *should* happen' (here he lowered his voice, and spoke jocosely, as he meant it)—'if any little thing *should* happen, I've got my pocket full of blank pardons.'

"A few minutes later M'Guire broke out into a fresh tirade, whereupon Taylor drew his revolver and shot him through the brain. He fell like a log. Walking up to the body, and standing astride of it, revolver still in hand, he looked coolly upon the excited crowd, and said:

"'Gentle*men*, I trust that *now* we shall have *order* in this meeting!'"

We suppose this one also may be credited. It seems to have the right ring:

"The familiarity of the frontiersman with scenes of shooting and executions by Lynch-law, and his coolness in the average Western affray, are proverbial. The last instance that has come to our knowledge in which enterprise and self-possession were admirably mingled occurred at the recent execution of a criminal in Washington Territory. Just as he was about to be swung off, and after he had remarked to the sheriff that he had nothing further to say, a real-estate agent, whose office was in his hat, forced himself to the front and up the steps of the scaffold, and, jointly addressing the criminal and the sheriff, said: '*If the gentleman who occupies the platform* will kindly yield for a *few minutes*, I would like to make a few remarks upon the cheap homestead lots at Dobson's Hole I am now offering for sale.' The request was assented to, and, after a brief summary of the advantages presented by that locality, the sheriff resumed his duties, pulled the cap over the 'gentleman's' countenance, and permitted him to drop."

An excellent article on Marblehead, Massachusetts, is one of the attractions of *Harper's*. It contains for the curious a picture of that famous animal, the gerrymander, who certainly wears a formidable appearance, and even our contemporary politicians might be shy of him. His reputed creator, Elbridge Gerry (of whose intelligent and pleasing face there is a portrait), was one of the great men of Marblehead, which has never wanted stout hearts. Mr. Whittier's Flood Oirson is another worthy described to us, and a much-belied old man he would seem to have been. His true name was Benjamin, and not Floyd, as the poet appears to have supposed; "Flood" being one of those endearing diminutives with which the inhabitants of small towns, even in their tenderest years, know so well how to grace each other. Moreover, it was not his perishing townsmen that Flood deserted; the distressed vessel was not manned by Marblehead people; and they did not mostly drown; they were mostly saved by a Provincetown whale-boat; and it was not in Chaleur Bay that the wreck occurred, but off Cape Cod; and the responsibility of its occurrence lay upon the crew of Skipper Ireson's schooner, who were ordered by him as he went below to lie by till morning. The men disobeyed, however, and afterwards charged their captain with giving orders which he had never given. This brought him the tarring and feathering, but it was not the women who did it; it was men; and the vehicle was not a cart but a dory. Still we have a fine poem, although the simpler of the Marbleheaders, unconscious of the nature of poetic license, sometimes comment on Mr. Whittier's version with severity and with profanity.

We must mention also a contribution by Mr. W. C. Wyckoff, giving the facts about the work done by our National Fish Commission, which appears to be most beneficently occupied. It strikes one strangely to be told that the main thing wanted in order to the cultivation of our coast fisheries, is to

prevent an indiscriminate use of the net during the spawning season, and to find a remedy for the greed of the bluefish. It appears that this fish is a perfect demon of voracity. He has been well likened, says one of the Commissioner's reports, to an animated chopping machine, the business of which is to destroy as many fish, big and little, as can possibly be destroyed in a given time.

Mr. James Parton, of all writers in the world, is out in *Harper's* with an article on the falsehood of the press, and coolly asserts that he looked about him everywhere in Washington for some sign of the existence of the lobby, but was by-and-by informed by Major Ben Perley Poore that there was not any lobby, that it was all "a gigantic myth." This is one of those attempts to say something startling which Mr. Parton constantly uses for the purpose of catching attention, and which only a shallow writer would employ. A topic covering something of Mr. Parton's ground is handled by Mr. F. B. Sanborn in the *Atlantic*, but it tells us little or nothing that has not been said in the numerous dissertations about himself which the journalist has now for some years been regularly turning out. A very fine fellow he is, according to his own account of himself. He is by-and-by to be more noble and of a deeper purpose than ever. His wielding of vast power in the country is going to be "nobler" also, and what the ideal journalist is not to be and to do we should be afraid to say. Perhaps he may spend less of his time in composing orations on his own nature and position and its capacities. The best thing in this latest essay is quoted from Dickens. Colonel Diver hands Martin Chuzzlewit the *Rowdy Journal*: "You'll find Jefferson Brick at his usual post in the van of human civilization and moral purity." One of the things not so good in it is the statement that the *Herald* was far in advance of the *Tribune* in the business of reporting the John Brown case. This is not much of an error, but as there is a bit of the Concord variety of philosophizing tacked to it, the reader finds a certain comfort in seeing the statement which was its basis made to collapse:

"There came a time, after Thoreau had said these things, when he was driven to the morning paper with as much eagerness as anybody; when, as he says, 'I read all the newspapers I could get within a week.' It was when John Brown lay wounded at Harper's Ferry, and his enemies, thronging about him, drew from him those answers that rang through the country for years, and still thrill the heart as we recall them. It was the everlasting reporter of the New York *Herald* who then and there noted down the undying words that might else have been lost or distorted in the recital of the base men to whom they were made. Then it was made manifest for what purpose the *Herald* had been allowed to exist all these years—no other paper could have had a reporter there, and without him the conversation must have perished. All this was 'foreordained and freely predetermined'; and John Brown, lying there on the armory floor, was the final cause of the *Herald* and its otherwise unaccountable editor. In those days the Times and the Eternities got printed on the same sheet, as they always do when a hero appears."

But the editor of the *Sun*, who then was connected with the *Tribune*, states that the *Tribune* had reporters on the spot as early as the *Herald*, and that their reports were fuller, more accurate, and more picturesque throughout than those of its rival. During the trial it had as many as five reporters present, and at the execution three. This is much better than having "the Times and the Eternities printed on the same sheet," and similar pieces of orphic wisdom. It appears that "John Brown was the final cause" of the Cincinnati *Gazette*, also.

The *Atlantic* has the beginning of Mr. Howells's new serial, which has all the old subtlety and elaborate finish; a poem by Mr. Bret Harte, which looks very like borrowing from Browning without leave, but yet would seem to be too boldly done for that to have been the case; and various other papers, of which the solid ones are Mr. William Wood's "Scotch Banking," and Mr. W. J. Stillman's judicious article on art instruction at South Kensington and Antwerp. Many of the others have a sort of *Overland Monthly* lightness and slightness.

The July *Lippincott's* is a very good number. Mr. Adolphus Trollope gives his recollections of his Oxford tutor forty-odd years ago, who was no less a personage than Archbishop Whately. As usual, the suave kindness of this prelate's manner is conspicuous in Mr. Trollope's narrative: A certain dunderhead among his pupils was up one day for examination. Some minutes were employed by Whately in a partial research into the vastness of the young gentleman's ignorance, when he suddenly turned round to another instructor with despair printed on his face, and said: "*It* has learned nothing; *it* knows nothing; *it* never will know anything." The pupil, being rather a dashing young fellow, with no small opinion of himself, for some days could say nothing except "he called me *it*, sir; he called me *it*." On another occasion he was still more the image of a minister of the Gospel: Some undergraduates dining with him, Mrs. Whately, willing to be polite, turned to one of them and asked him what was the opinion of the men in the hall on the political question which happened then to be agitating every one—the Reform Bill of '32. The question was overheard by His Grace, who roared out from the other end of the table: "Why don't you ask the opinion of the bedmakers?" The youth to whom this was addressed had readiness enough to reply that he had already ascertained that, and that they were all Liberals to a man, though, as the Doctor had remarked, very ignorant persons. Whately was himself a Liberal. "The New Hyperion" amuses us this time by an actual meeting between Paul Fleming and the romantic Mary Ashburton of the old days. She is of course fat now; but while there is a little overdoing of the fun in some such respects, her silliness and the vain delusion of Paul are cleverly given; and indeed in so whimsical a tale anything can be defended. "Some Old Proverbs" will be found entertaining, and so will "Under the Cypress," a hunter's and fisher's description of the cypress swamp and its game. It is capital. Good, too, is the article on the Schuylkill country, with its references to the Mennonites and the Pennsylvania Dutch. But, in fact, all of *Lippincott's* is excellent.

Spain and the Spaniards. By N. L. Thieblin, "Azamat-Batuk." In two volumes. (London: Hurst & Blackett.)—In this book the reader will find no complete description of Spain as it appears to the tourist's eye; there is no account of the wonderful and varied scenery of that little-known country, nor of its art collections; nor is there any serious attempt made to unravel the knot of Spanish political affairs. It was written by a well-known London journalist, who visited Spain as correspondent of the New York *Herald*, and tells us what he saw there during the Carlist rising of last year. Of course there is a certain amount of space devoted to the presentation of the state of the newly declared republic and of the claims of the Carlists, but not more than is needed to save the reader from ignorance of the subject. The author gives us very little theorizing from facts, but he gives us plenty of facts from which we can draw our own inferences, and it is in this way that the reader is enabled to form a comprehension of the anarchy existing in Spain, and of the feeble basis on which the Republic rests, such as could never be attained by reading ignorant resolutions in favor of Spanish republicanism, passed at three or four thousand miles' distance. The tendency of a man who writes from so neutral a point of view as that of the newspaper correspondent, is towards a disagreeable cynicism; he demands what are called sensations, with indifference to their general bearing, but this quality also saves him from too partial a view of what he is sent to watch. We ask him merely to take the place of our own eyes, and the way in which he does this is the measure of his success or failure.

We know of no book that so well represents the condition of modern Spain; the author had the advantage of previous familiarity with the country, and he treats both Carlists and Republicans with an impartial hand. He is conscious of the incapacity of Don Carlos himself, of the pretentiousness of the Carlist war-making. Of this we quote an amusing example. After recounting one or two campaigning scenes, he says:

"Such and similar episodes were almost of daily occurrence, and the whole of our life in the Campo del Honor, with its eccentric adventures, its various encounters with strange characters in the most astounding costumes, and its serio-comic background of religious crusades, and daily masses celebrated by priests in top-boots and spurs, had something about it which reminded one immensely of Offenbach's and Hervé's operas. In fact, when Don Carlos and his generals were not present, we—the foreigners and the Frenchified Spanish officers—used to salute each other with the well-known chorus of 'Little Faust':

"'Vaillants guerriers,' etc.

Occasionally, indeed, it seemed to me, from a good many analogies, as if this chant had been specially written for us, and, as if to complete the joke, it turned out that the popular song of the gendarmes in 'Geneviève de Brabant' was sung by every volunteer in the force, it being—so I was told—a national melody of Guipuzcoa."

More serious consideration is accorded the Carlist generals, who seem to be superior in every way to the Pretender, and full credit is given to many of the qualities of the army. The admirers of the ready tongue of Castelar will find an account of that orator's qualities as a minister, which will perhaps enlighten them but will not very much delight them, and there are some interesting pages about Figueras.

The Heroes of the Seven Hills. By Mrs. C. H. B. Laing, author of the 'Seven Kings of the Seven Hills.' (Philadelphia: Porter & Coates.)—Mrs. Laing's little volume is a worthy companion to her earlier one. It is, like that, a pleasant rendering of the old stories that everybody ought to know in a form well adapted to attract children. The style is somewhat artificial: probably in no other country under the sun would Menenius Agrippa's familiar fable appear as of the "abdomen" and the members. The illustrations are excellent, and the type well suited to children's eyes.

RECENT GOVERNMENT PUBLICATIONS.

Department of the Interior, United States Geological and Geographical Survey of the Territories. F. V. Hayden, United States Geologist-in-Charge. Miscellaneous Publications No. 4. 'Synopsis of the Flora of Colorado.' By Thomas C. Porter and John M. Coulter. Washington: Government Printing Office, March 20, 1874. 8vo, pp. x.-180.

This volume, a continuation of the series of reports by Dr. Hayden, is a valuable contribution to the natural history of the West, forming as it does a complete hand-book of the botany of Colorado Territory. It is not a mere list of the species, but an actual synopsis, and embraces descriptions of all the orders, genera, and species not contained in Gray's 'Botany,' Chapman's 'Flora,' and other botanies of the States east of the Mississippi River. In view of the fact that the mountainous districts of Colorado are at present visited by many travellers and naturalists, the publication of this book is very timely, and we presume it will be eagerly sought after. A full and complete alphabetical index, referring to all the families, genera, and species, adds greatly to the value of the work. Of the authors, Mr. Coulter was the botanist of Dr. Hayden's survey for several years, while Professor Porter of Lafayette College, Easton, Pa., is well known as one of our best specialists in botany. The authors, in their introductory letter, acknowledge the assistance of Professor Lesquereux in the elaboration of the Musci and Hepaticæ; of Henry Willey in that of the Lichens; and of Charles H. Peck in that of the Fungi. They also return thanks to Dr. Gray, Mr. Sereno Watson, Dr. George Thurber, and Mr. J. H. Redfield; and they state that the plan followed in the synopsis is that of Mr. Watson in his catalogue, Vol. V. of Mr. Clarence King's Report. This hardly expresses the degree of their obligation to Mr. Watson, however, in view of the extent to which the subject-matter has been copied directly from his publications, with or without material modification.

Report on a Naval Mission to Europe, especially devoted to the Material and Construction of Artillery. Two volumes quarto. Washington. 1873.

In 1870, Captain (then Commander) Edward Simpson, of the Bureau of Ordnance, was instructed by the Secretary of the Navy to proceed to Europe for the purpose of enquiring into the more recent improvements in naval ordnance. In carrying out his mission, Captain Simpson reached London in July, 1870, and proceeded thence to Belgium and to the great establishment of Krupp at Essen. From this point he went to Italy, and visited the various arsenals and dock-yards at Naples. He then passed on to Austria, where he devoted particular attention to the torpedo establishments at Vienna and Fiume. In Prussia, he was not permitted to visit the manufactory of small arms and the laboratory in Berlin, but free access was allowed to other establishments. At St. Petersburg, every facility was extended to him; as also in Sweden, where he visited the celebrated Dannemora Iron Mine. Returning to England in June, 1871, he remained there for a month, and then proceeded to Holland. In October, 1871, he was enabled to visit Paris after the close of the war. Here he inspected various dock-yards, foundries, etc. At Brussels, he examined thoroughly the subject of phosphorus-bronze as a material for cannon; and at the end of 1872 he returned to the United States. Captain Simpson's report of his observations, which were extremely minute, is illustrated by a large number of plates, and contains a great deal of practical information which cannot fail to be of very great value not only to the Government but to manufacturers of metal and of ordnance. The two volumes form an appropriate companion series to the superb volumes on 'Metals and Ordnance' by General Rodman, published some years ago by the Ordnance Department of the Army.

BOOKS OF THE WEEK.

Authors.—Titles.	*Publishers.—Prices.*

Fine Arts.

THE DRAMA.

SALVINI IN ALFIERI'S TRAGEDY OF "SAUL."

THE enjoyment given by great acting and great writing was rarely combined when, a fortnight ago, we were allowed to hear Alfieri's masterpiece of "Saul" from Signor Salvini and his company. That slight tendency to suspicion with which we have watched the other personations of Salvini, the jealous fear lest we were being captivated by a higher kind of melodrama, was quite absent from the pleasure which this particular effort called forth. In "Saul" the actor showed himself calm and massive in style, penetrated with great ideas and powerful intuitions, ingenious in the extreme yet constantly tending to simplicity, and wrapped in a rugged primitive grandeur altogether befitting the royal colossus he portrayed. The play is entirely one of declamation, up to the suicide at its close; and in its conduct the tragedian found occasion for almost every resource of invective, eloquence, lamentation, satire, and despair. His first appearance was most telling: he moved slowly forward from the royal pavilion to the throne set at the tent-door, his head sunk between his shoulders and helplessly balancing with the first weakness of senility, his mantle strained tightly around his herculean shoulders, the hair and beard a heap of grey, and the filmed eyes vainly seeking for joy in the sunrise of Gilboa. The picture was so perfect and so protracted that it seemed as if it never would or ought to speak, and the first words, profoundly hollow and low, struck strangely upon the attention of the spell-bound and silent house. Saul talks at first to his own heart, praising the token of the dawn, and asking for his bygone years. The first question of Abner, however, arouses that leonine querulousness, that infinite dissatisfaction with all things, and that perpetual challenge or accusation of circumstance, which are the key-note of Alfieri's conception. The reproaches to Abner for being young and looking at the future with eyes of youth are followed by long complaints really addressed to destiny, but falling with envenomed bitterness upon his son and his daughter Michal, whom he calls "figlia del pianto." David entering is met with similar upbraiding, until he closes the argument with the fragment of Saul's mantle cut at Engedi. This is a whole act of unredeemed and we may almost say peevish abasement, requiring all the force of a naturally noble speaker to give it dignity. In Salvini's hands the complaining king is like the "Jeremiah" among the prophets of Michael Angelo. The act is ended with a bit of play thoroughly in keeping with the accent of mistrust which runs through it; having reconciled himself with his children and with David, and sent them kindly into the pavilion for repose, Saul remembers the plotting Abner, who is about to retire; the monarch thereupon stalks over the scene to Abner, wrapping his robes about him anew, and tossing his beard outside his mantle with a huge jerk of his lion-like head; cows Abner with his glance, and drives him before into the tent, laying upon his shoulder the powerful hand which still crushes the morsel of purple which is the sign of David's fidelity. This action is not indicated by Alfieri, but it adds a touch to the color of the scene. The painting of the whole act is in that tone of heaviness without the hope of remedy which Alfieri takes from Greek tragedy. Saul and Michal are a wandering Œdipus and Antigone. An act is not thought too much to give to this mere portrayal of a mood, the mood of a hero whom the Eumenides have marked, and who has no longer a motive for effort or energy.

To introduce some fibre into such a portrayal of abandoned misery, the chords of jealousy, of cruelty, and of inspired despair are introduced. But first comes the great scene when David soothes the king with his harp, and with the series of short, crisp chants which Mr. Browning has imitated in one of the most sustained and eloquent of his poems; it is quite impossible to describe this scene, where Salvini scarcely moves from an attitude of statuesque grief upon his seat, but where emotions of pride, peace, and delicious memory chase each other across his speaking face. This episode, which, like that of "Hamlet," is a "play within a play," is cut off by the poet with a touch peculiarly oriental and savage. David, singing like an Arab robber, forgets himself in his boast: "I overtake, I overthrow, I disperse the Philistine: I show that we have two swords in the field!" Upon which Saul cries suddenly, from the midst of his lethargy: "Is any sword in camp save mine?" and, while David flies, the act closes upon the king's picturesque ravings.

There is vast irony, and irony to the purpose, since it has power to blast where it strikes, in Saul's treatment of the priest Ahimelech. In this

dialogue occurs Alfieri's superb description of a captive heathen king, "taken in battle with arms in hand, a great king, a warrior burning with generous desire and lavish of his own blood in the cause of his people." Loaded with chains, neither inveighing nor pleading, he is dragged before admiring Saul. But "to ferocious Samuel he appeared guilty of valor":

". . . . Reo di coraggio
Parvi egli al fero Samuel!"

And the sacerdotal headsman thrice struck at the life of the victim with his own priestly hand. Saul rises into epic wrath against those who "mock, in security, the perils of warriors," the "less than women," the wielders of the "*verga vil*" and "*studiati carmini*," who, "clothed in effeminate linen, dare direct those who sweat in armor." From this burst he is recalled by Ahimelech, who reminds him that before the Eternal he is but crowned dust; a sentiment received by Saul in Salvini's personation with an all-abounding gesture of humiliation. The severity which Samuel had used upon Agag is returned ninefold upon Ahimelech and his priests; and the fourth act closes upon Saul soiled with sacerdotal blood, and lamenting that he is alone: "*Sol, con mi stesso, io sto. Misero re!*" But first occurs a piece of still finer and more poignant irony than that which is wasted upon the linen ephods of the priests. It is when Jonathan, trying to incite Saul to forgiveness of David, is told for the first time of his own fate from the lips of his father. "To-morrow," has proclaimed the ghost of Samuel (in the somewhat dubious grammar of our translation), "shalt thou and thy sons be with me." Nothing could well be more profound than the Italian-like recoil of argument and expressive weightiness of a hidden thought shown by Salvini when he meets Jonathan's generous plea with the outburst of this reserved revelation. He grasps the youth by the body like a reed, and plucks murderously at his breast, as with blazing eyes he pours into his mind the hot torrent of his jealousy and terror: "My house shall be extinct and uprooted by him who shall usurp my sceptre; thy brothers, thy offspring, and thyself, naught shall remain of all my race." To deaden this mighty shock, Alfieri has simply put in the character of the young prince an inexhaustible fund of patience and sense of fatality: "Does the sword of man avail against the celestial brand?"

It is the fifth act, filled with the terrific after-dream and rumination of the scene at Endor, which tests the actor who essays Alfieri's "Saul." It is one of the greatest opportunities and problems of the whole Italian repertory. The opening speech:

"Ombra adirata e tremenda, deh! cessa,"

is often spoken by the performer crouching at the foot-lights. In Salvini's representation it is sent from the profundities of the tent, preceded by some articulate moanings. The agony of despair with which he pleads with the mighty shade of Samuel for himself and his children culminates with the raving words: "Thy eyes are bloodthirsty, thy sword and hand are of fire; from thy wide nostrils come flames which dart upon me; they touch me; I burn." At this point the tragedian, seemingly beside himself, turns thrice upon himself and runs back, tearing away the garment, which appears to burn his flesh like a Dejanira's robe. All through this scene he moves over the stage in the loftiest kind of tragic possession, filled with passion, yet controlling it, and displaying the true artist in his wildest moments. The picture is complete when the mad king, for whom the air is filled with phantoms, believes he is grasped from behind by the hair, and turns to fall into the arms of his daughter, who, with tears and anguish, has followed him through his distracted wanderings. Who but Salvini could give us that agony of terror, that revulsion of sobbing reassurance? After this there seems no opportunity for a greater climax; yet the actor (who has invented this encounter between the king and his daughter without the poet's hint) contrives a superior one soon after for the close. It is when he smooths his wild hair under the heavy Hebrew crown, drapes himself, and falls upon his sword, moved with a very human mingling of decorum and despair. It is a sudden, an abrupt truncation of the drama. The fault is the poet's if there is too little of the twine and woof of tragedy in this hasty conclusion. Yet, for the play as a whole, as a construction at once classical and biblical, the world is indebted to Alfieri. It is rather heated than emotional; perhaps it is rather a disturbing influence in the mind than a pathetic charm; but it is stirred from beginning to end with a current of real feeling, and has in that respect a vast advantage over other classic Hebraisms that we know; over "Esther," for example, and "Athalie."

This was the only new piece presented by Salvini and his troop during the engagement. The support was insignificantly good, the theatre (Booth's) much better than the Academy of Music; the Italian scenery and properties tawdry. It is significant of the immensity of the propaganda which we have yet to undertake in Europe before the greatness of the national eagle will be fully understood there, to know that Sr. Salvini really thought it would be necessary to provide and bring over his scenery, believing that matters of that kind could not be procured in the New World.

Readers of "The Nation" are apt to have difficulty in finding light reading up to their standards. Their attention is invited to

THE LEISURE HOUR SERIES,

which consists exclusively of works agreeable to the most cultivated taste. Catalogues sent free.

Henry Holt & Co., Publishers, 25 Bond Street, New York.

HARPER'S CATALOGUE. The attention of those designing to form libraries, or increase their Literary Collections, is respectfully invited to Harper's Catalogue, which comprises a large proportion of the standard and most esteemed works in English Literature—*comprehending over three thousand volumes.*

Librarians, who may not have access to a trustworthy guide in forming the true estimate of literary productions, will find this Catalogue especially valuable for reference.

The Catalogue is arranged alphabetically by the authors' names, anonymous works by their titles. The index is arranged by the titles of the books, besides having numerous appropriate heads, each general head being followed by the titles of all works on that subject.

Harper's Catalogue sent by mail on receipt of ten cents.

Address HARPER & BROTHERS,
Franklin Square, New York.

PRETTY FEET SHOULD BE Shod in ENGLISH CHANNEL Shoes. All Ladies Insist on having them. They show a dark line around the sole near the edge. They never wear ragged. They wear longer, and cost no more.

STANDARD PUBLICATIONS.

LIST No. 2.

THE CHILDHOOD OF THE WORLD. A Simple Account of Man in Early Times. By Edward Clodd. 16mo, cloth extra, 75 cts.

THE MARVELLOUS COUNTRY. Three Years of Travel and Exploration in Arizona and New Mexico. By Judge Cozzens. Upwards of 100 Illustrations. 8vo, cloth extra, black and gold, $3 50.

TRIBUNE POPULAR SCIENCE. By Agassiz, Proctor, Chandler, Hammond, Brown-Séquard, Bayard Taylor, and others, and containing "The Wheeler Explorations" and "The Meeting of the Academy of Science." 8vo, printed on fine paper, bound in extra cloth, $1 50.

In preparation: 'Prof. Schliemann's Trojan Antiquities. The Discovery of the True Site of Troy.'

Any book on this list sent by mail, on receipt of advertised price, by HENRY L. SHEPARD & CO., (Successors to Shepard & Gill,) Publishers, Boston.

CHOICE SUMMER READING,

ESTES & LAURIAT.

SLAVES OF THE RING. 1 vol. 8vo, paper, 75 cents. By F. W. Robinson, author of 'Second-Cousin Sarah,' 'Little Kate Kirby,' 'For Her Sake,' 'Poor Humanity,' 'Her Face was Her Fortune,' 'True to Herself,' etc.

A TANGLED SKEIN. 1 vol. 8vo, paper, 75 cts. By Albany Fonblanque, Jr. An author who has inherited genius of an uncommon order.

"This novel captivates the reader when he first opens it, and holds him in strong and agreeable chains to its closing page."—*Boston Traveller.*

"It is so well written that, having once taken up the book, it will be impossible to lay it down until the end."—*Press.*

THE WEEK IN TRADE AND FINANCE.

NEW YORK, June 29.

MONEY has remained in abundant supply at 2 to 3 per cent., while at times there was absolutely no use whatever for all that was offering. Commercial paper is in good demand at 5 to 6 per cent. for firm names having a short time to run.

The statement of the Clearing-house banks on Saturday showed that they had gained $884,700 in reserve, against an increase of $5,168,700 in liabilities, which, if compared with the statement of the previous week, shows a falling off of $407,475 in the net surplus reserve; but owing to the new currency law, the banks are no longer required to keep on hand a reserve against their circulation beyond the 5 per cent. to be kept in Washington, and consequently the only reserve required is 25 per cent. against their deposits, which this week would be $58,232,200, as shown by the figures given below.

The following is a comparison of the averages of the past two weeks:

	June 20.	June 27.		Differences.
Loans	$279,067,500	$281,791,500	Inc..	$2 724.000
Specie	19,934,300	19,714.300	Dec...	219 900
Legal tenders	61,838,600	62,923,200	Inc...	1,084,600
Deposits	227,619,500	232 929,200	Inc...	5,309.700
Circulation	26 652,300	26,511 300	Dec...	141,000

The following shows the relation between the reserve and the liabilities according to the new law:

LAWFUL MONEY.

Specie	$19,714,300
Legal tenders	62 923 200
	$82,637.500

LIABILITIES.

Deposits	$232.929,200
25 per cent. of which is	58.232.300
Showing a surplus of reserve over the 25 per cent. required by law of	24,405,200
And a gain over last week of	6,200.350

The stock market has been active, with the course of prices steadily towards improvement. The market advanced from 3 to 5⅝ per cent. during the week, the greatest rise in any stock being that in Wabash, from 30½ to 36½. To-day a still further advance took place, carrying Central and Hudson up to 101, Lake Shore to 77⅝, Rock Island to 102⅞, Wabash to 39⅞, Western Union to 76, Northwestern Common to 44⅜, St. Paul Common to 41½, Pacific Mail to 45⅞, Ohio and Mississippi to 26⅞, Union Pacific to 29½, and C., C. and I. C. to 20¾. At the close this evening there has been a reaction in prices of from ½ to 1½ per cent., which is natural, considering the handsome rise of the last few days. Undoubtedly the demand which has existed for stocks has come in part from parties who were short, but there has been for some weeks past a continued demand from investors for such stocks as Central, Rock Island, and Lake Shore, as well as for the more speculative ones from those shrewd parties who always buy when the market is unduly depressed, and who pay for the stocks they buy and take them off the Street.

The large bear operators are still said to be short on their sellers' contracts which they put out two weeks ago, but there is no way of ascertaining the truth of the report; they may buy stocks for cash, hold them for a rise, and sell them out again, all the time being short on sellers' contracts, which they are not called upon to fulfil for five weeks yet, and they may have reason to think that prices will be down again by that time to a point sufficiently low to enable them to buy back at a profit.

Two failures have taken place among the bears during the week in consequence of the sharp advance in prices. That of an operator who sold right and left on the "make or break" principle, was quite a serious one among those brokers who were so unfortunate as to take his orders or his contracts. It is generally the case that, on comparatively small advances in the market, more bears fail than bulls on sharp declines. The reason for this is that the former are not called upon for large amounts as margins, while the latter have to be prepared to carry their stocks by hypothecating them at ten or fifteen per cent. under the price at which they were purchased. The bear, consequently, will take the greatest risk, and a small advance generally means a heavy loss to him.

The following shows the highest and lowest sales of the leading stocks at the Stock Exchange for the week ending Saturday, June 27, 1874:

	Monday	Tuesday.	Wed'day.	Thursday	Friday.	Saturday	Sales.

The Government bond market has been quiet, and prices to-day show only a small deviation from those current a week ago. During the early part of the week the market was strong and higher, but later, with lower gold and a weaker London market, prices declined a fraction.

The following are the closing quotations this evening:

U. S. 6's of 1881.....121⅜@122⅜	U. S. 5-20, 1867 .....120⅞@121
U. S. 5-20, 1862.....114⅜@114⅝	U. S. 5-20, 1868.....120¾@121
U. S. 5-20, 1864 .....117 @117⅛	U. S. 5's, 10-40 .....114 @114⅛
U. S. 5-20, 1865, May and Nov..117¾@118	U. S. 5's of 1881.....114 @114⅜
U. S. 5-20, 1865, Jan. and July..120⅛@120⅜	U. S. Currency 6's.....115⅛@115¾

The only transactions in State bonds of any importance have been in Tennessees, which have ranged at about 80 for both the old and new issues. The State Treasurer of South Carolina has declined to recognize some $340,000 certificates of indebtedness authorized by the last legislature, on the ground of unconstitutionality. These certificates were made receivable for taxes, and proceedings have been commenced against the Treasurer to make him honor them.

The advance in gold on Monday of last week to 112 was not maintained, the price gradually settling to 111⅛. The following shows the range of quotations for the week:

	Opening.	*Highest.*	*Lowest.*	*Closing.*
Monday, June 22	111¼	112	111¼	111⅜
Tuesday, June 23.	112	112	111⅝	111¾
Wednesday, June 24.....	111¾	111¾	111⅜	111⅝
Thursday, June 25.....	111⅜	111⅜	111⅛	111¼
Friday, June 26.....	111⅜	111⅜	111⅛	111¼
Saturday, June 27.....	111¼	111¼	111¼	111¼

At the Government sale on Thursday the total amount of gold bid for was $1,795,000; the amount to be sold, $1,000,000, was awarded at 111·07 to 111·26¾. The shipments of specie for the week amount to $1,020,310. The total amount shipped since January 1 is $30,027,947, against $26,962,225 for the same period in 1873, and $36,036,607 in 1872.

The Nation.

NEW YORK, THURSDAY, JULY 9, 1874.

The Week.

ONE of the railroads, the Chicago and Northwestern, a portion of whose line runs through Wisconsin and is menaced by the "Potter law" of that State, applied through its bondholders for an injunction to the United States Circuit Court, a fortnight ago, restraining the State Attorney-General from bringing suits or otherwise vexing the road under the State legislation, on the ground that it would thus be prevented from earning enough money to keep its contracts with its creditors. The Court has denied the injunction, leaving the merits of the case untouched, and a case was made up for an appeal to the Supreme Court; and indeed the argument before the Circuit Court was not much more than a formal step in this direction. The decision has, therefore, by no means all the weight which stockjobbers and sensation-mongers are attributing to it, and it by no means affects all railroads, as some people imagine. At the very worst, it simply decides that the provision of the Wisconsin constitution which reserves the right of altering or revoking charters granted by the Legislature, is applicable to all railroads now working within the State. It consequently does not in the least touch the principle established by the Dartmouth College case, and settles nothing as to the relations of American railroads in general to the State or General Government. The case will doubtless be argued before the Supreme Court in the course of the coming year, but even the decision of that Court will not, on the points raised in this instance, settle the real question pending between the Grangers and the owners of railroads, because it will not touch the railroads made under charters granted by States whose constitutions contain no such reservations as those of the Wisconsin constitution, or railroads made before the adoption of constitutions containing such reservations.

The position maintained by the counsel for the State, which the Court has nominally sustained, is that the right to "alter or amend" charters reserved by the constitution includes the right to fix rates of compensation whether they are "reasonable" or not; and that the State might, if it pleased, compel the railroad to pay the whole of its receipts into the State treasury by way of taxation, or, in other words, might confiscate the property of the stockholders and their creditors. Nothing more monstrous in the way of a definition of a right was probably ever heard outside of a buccaneer's cave. The books of the company were produced in court, and it was shown clearly that the rates imposed on the road by the State law did not afford the lawful rate of interest on the capital invested in its construction. The railroad companies are now asked to trust their property to the mercy and discretion of the State legislature, which is poor comfort, considering the mode in which that body has approached the question in its recent legislation. It is becoming clearer every day that the Western movement against the railroads is, under cover of redressing a few acknowledged but on the whole trifling abuses, a fresh outburst of dishonesty by which a certain portion of the community is infected as with the scrofula, and which finds vent now in one form, now in another, and which politicians are always ready to use. Four years ago it was in an attempt to pay the public creditors in greenbacks; now it is an attempt to plunder the railroads; and next year it may be in a raid on all non-resident creditors. The worst of it is that when these eruptions show themselves, honest men are apt to look on and smile at the outset, or else, as in the present instance, stimulate them a little, in the hope that, though offensive in themselves, some great good may eventually result from them to the body politic. In the matter of railroads, leading Liberal Republican papers and orators fanned the flame of hostility to the roads, in the belief that it would result in the promotion of a powerful opposition to the Republican party. We always denounced this as a wretched delusion. It has ended, as it was plain it would end, in an attack on property of which the King of Dahomey would be ashamed, and which places the country once more in a discreditable attitude before the civilized world, and is likely to inflict great injury on American industry. But there is good reason for believing that this early pushing of the thing to the extreme will open the eyes of the people to the danger with which this Granger folly is threatening American industry and fame.

A railroad law has also been passed in Iowa, and under it a cast-iron schedule has been drawn up, imposing rates on the companies which they pronounce unreasonable, because unremunerative. The General Superintendent of the Chicago and Rock Island road has, however, written a letter to the Governor of the State, in which, after stating the case of the road as against the new rules, he promises to test the operation of the new law in actual practice before assailing it in the courts. "If," he says, "the result of a thorough and satisfactory experiment should show that an observance of the rules must involve a permanent surrender of the revenues to which the company is entitled from the operation of its lines, a different policy will be adopted, with a view to securing such revenue, and any attempt to enforce the act as a valid law will be resisted in the proper tribunals."

The findings of the court-martial in General Howard's case have been published. They declare that the General did not knowingly violate any law of Congress, or rule of the army or of the navy, and did devote all his time and energy to the work entrusted to him, and has made a satisfactory accounting to the Treasury, and that in those cases in which improper investments had been made of the funds of the Bureau, it was done under the advice and opinion of the Second Comptroller, and General Howard was therefore not to be blamed for it. The court was not unanimous on all the points, but was on the main conclusion. General Holt, the Judge-Advocate, has, however, reviewed the finding in a way which General Howard will hardly enjoy. He holds that though it could not be said that he violated laws or rules with bad intent, yet he *did* violate them in point of fact, and, if in ignorance, it was ignorance for which there is no excuse; that when General Howard took charge of the funds of the Bureau, instead of adopting proper precautions for their safe management, he laid aside some safeguards already in use; that he adopted systems of account which did not explain themselves; that he converted public money into bonds, in violation of positive law, on the advice of a subordinate officer of the Treasury, and without referring his action, as in duty bound, to the Secretary, his superior officer; that he also failed to inform this officer that a sum of $300,000 had been for a whole year invested in these bonds until two years after it had been reconverted into money, and then failed to account for the year's interest; and that he presented one account in which a charge of $16,000 was made against the Treasury which had already been paid out of other public money. These and various other omissions, errors, and disorders, General Holt admits, were doubtless the results of ignorance or carelessness; but he would not have it go forth that such ignorance or carelessness in an officer of General Howard's standing is excusable. The President, who seems to have a never-failing tenderness for a man on whom an investigation of any kind has fallen heavily, at once appointed General Howard to the command of the Department of Columbia.

The week has been a sorrowful one in the United States Treasury. It appears that no clearance of supernumeraries and persons employed without authority of law has been made since the war until now. The recent reductions made by Congress in the appropriations, however, combined with the advent of Mr. Bristow, have led to a thorough overhauling of the force of employees, and to the dismissal of from 600 to 700, a large number of them women, and many of these having other persons dependent on them for support. The scenes which followed the announcement of the changes are described by the reporters as heartrending, as many as fourteen of the women fainting. All this is very sad, but it is not so sad as the abuses which have made it necessary. The management of the Treasury since the war has been a national disgrace. The reforms we now witness ought to have been begun in 1865, and they ought to have been accompanied by preparations for specie payments; instead of which, specie payments were laid aside as unworthy of attention, and the Treasury was turned into an almshouse for the relief of helpless women and old soldiers. Mr. Boutwell, according to one of his reports, carried it on for awhile as an institution for the education of divinity and medical students, and then, to crown all, Mr. Richardson made it a place in which thieves could store their plunder, and "check against it," as the bankers say. It seems likely now to become a clean, well-ordered institution, conducted on business principles.

Mr. Bristow has done two other things which have produced a slight sensation in political circles. In letting out the bonded warehousing business in this city, he exacted a guarantee that persons applying for it should personally superintend it, to prevent the subletting of it, which was one of the scandals of the Leet and Stocking period and, before that, of the Bowen period. He has also offered a portion of the new five per cent. loan to bankers in general, without the intervention of any syndicate, a step which may or may not result favorably, but which has at any rate a healthy look, and speaks well for the purity of his policy. The objection to it is that bankers will hardly like to bid very high for a portion of the loan when they have no guarantee that the remainder may not be disposed of at so low a rate as to close the market to them. The suggestion that the bonds should be sold to the public at retail by the Government at a moderate rate, which has been made, is one worth Mr. Bristow's consideration. We are in hopes that before long he will try and let a little light in on the circumstances under which the firm of Clews & Habicht was substituted for the Barings as Government bankers by good Mr. Boutwell. There is a widespread, and we believe well-grounded, impression that that transaction too needs investigation, and we trust it will receive it.

Mr. Hale's ill-health has obliged him to decline the office of Postmaster-General, and the President has accordingly appointed a new successor to Mr. Creswell. His choice this time has fallen upon Mr. Marshall Jewell, ex-Governor of Connecticut and for about a year United States Minister to Russia; and as Mr. Jewell has returned his acceptance by Cable, the matter may now be considered finally disposed of. The motive of this selection could hardly be guessed without some knowledge of Mr. Fish's sense of the value of Mr. Jewell in his present place; but as the latter is a person of proved executive ability, and apparently well fitted for his new duties, it seems idle to speculate on the President's preference for a New-England Postmaster-General, or his assumed alacrity in letting off the next friend of Speaker Blaine.

The Maine Democrats have given Mr. Blaine a chance of which he is not slow to avail himself in his letter of acceptance, written to the Convention which has just renominated him for Congress. It is a chance of which an adroit man might be quicker to avail himself than a candid man; though it would seem that it hardly lies with some of the Maine Democrats to make any complaint as to the way in which their words have been turned upon them. They declared in their Convention the other day that they were opposed to protection, that they were in favor of free-trade; and their candidate for governor wanted the people educated up to a belief that revenues should be derived from a wise system of excises or from direct taxation of the people. Mr. Blaine points out that direct taxation would be levied *per capita*, and would bear heavily on the individual voter, and that excise systems on the other hand are odiously inquisitorial and would tyrannically oppress various enumerated industrial classes—all to the benefit of the foreigners who, under Mr. Titcomb's proposed arrangement, would have the opportunity of overrunning our markets free of tax. That the unfortunate Convention probably meant no more than that it wanted free-trade in the sense of having our revenue derived from a few articles, and was opposed to tariff bills in the interest of protection, Mr. Blaine discreetly considers himself discharged from mentioning. The proposed treaty of reciprocity was Mr. Blaine's other important topic, though he did not fail to praise the Republican party for its economical achievements during the last session of Congress. Of reciprocity he has a low opinion, but apparently only because of its apprehended ill effects on certain local interests. The fact is, Maine is so like Canada in its various productions, natural and artificial, that whatever may be the interest of the country in general in the passage of the treaty, her own interests would probably suffer, and the Republicans of the State may be depended upon to oppose the treaty. Meantime, Mr. Blaine is no doubt sure of a re-election.

We have commented elsewhere on the municipal imbroglio. The detailed history of it is interesting though somewhat hard reading for hot weather, and we should not attempt to give it, even if it were possible for an outsider to give it correctly. The main fact of it is, however, worth dwelling upon, because it shows the worthlessness of all charters, however carefully drawn, as long as the legislature is what it is. The Custom-house Ring fought bitterly two years ago against giving the Mayor the sole power of appointments, and made him share it with the aldermen. Last winter, however, either they made some kind of private agreement with him, or obtained some knowledge of his designs, which caused them to get a supplemental act passed giving him the sole power of appointment in the case of police commissioners, or, in other words, making an exception to the rule in the very case in which their rule, if it had any value, was most necessary, and this bill Governor Dix signed, though it surely must have excited his suspicions. The only good excuse for his signing it that we can see, was that he had advocated this mode of appointment when the charter was under discussion, but he surely ought not to have sanctioned patchwork amendment of this sort, even if he had believed in the honesty of its promoters, and he is too old a politician to have believed that the Custom-house intriguers would face right-about in the way they have done without a corrupt understanding with the Mayor. It is the one act of his administration which we think he might rightfully regret.

The Tammany Association had its annual "long talk" and its annual "short talk" on the Fourth, the sachems and warriors meeting in council, and "Grand Sachem Augustus Schell acting as chairman and wielding his tomahawk." The long talk was made this year by Sachem J. S. Thayer, and was of a nature not to seem short, whatever its brevity. The short talk, by Mr. Fernando Wood, was "in the pithy style which marks the speech of the red man," but neither is that rich in quotable passages. To tell the truth, deep dulness personified and ancient tediousness were characteristic of all that the Indians, big or little, managed to say. Of the two thousand letters received from outsiders some are not open or less open to this same charge, but to some it applies in full. Ex-Governor Randolph, of Virginia, expressed a thought which has more than once of late occurred to him: "Much as there is for congratulation coming out of recent political successes, so much remains to be done that requires great wisdom, moderation, and patriotism, that I am more anxious as to the policy which shall

guide our future than jubilant over past success." He adds, still more significantly: "My apprehension has been that our old file-leaders may fail to recognize the fact that after years of political adversity we are being put upon our trial here and there, and not by reason of these occasional successes guaranteed a general or national success." Mr. Clarkson N. Potter was for a comprehensive policy; he would have the party demand at once such amendments to the Constitution as should "limit the authority of Congress over vested rights, deprive it of the power of private and special legislation, put a check upon the growth and abuses of great corporations, and break up the vast and increasing patronage of the Executive." The general tone of the meeting was, however, that the warriors had only to wait, and their enemies would, without much strategy being called for, fall a prey. It is surprising and depressing to observe how flat, by reason of iteration, the long list of recent Republican errors and crimes falls upon the ear. Mr. Cox recited them, beginning with Crédit Mobilier frauds and coming down past the Gatling guns and Durell's order to Jayne's handcuffs, and it was all far less like a charm to conjure with than could be wished. Governor Randolph's may, after all, be the best advice for the sachems to listen to.

The coroner's jury which has been examining for a couple of months the causes of the Mill River disaster has rendered its verdict. It is what was to have been expected. It censures the lawmakers, the proprietors of the reservoir and especially their building committee, their supervising engineer, the contractors, and the county commissioners—in short, everybody who was immediately or indirectly responsible for such a false and fatal construction as the Williamsburg dam. It is hard to say on which of all these shoulders the verdict lays most blame, but, distributed as in justice it unfortunately had to be, it is still severe enough—severely moderate enough—to produce what we may hope will prove a wholesome remorse in the breasts of the individual culprits. The State's portion of condemnation will cause no tingling of conscience and no sleepless nights to any one, but it will doubtless bear fruit in improved legislation tending to make the recurrence of such foreordained disasters impossible. The existing statute, say the jury, "has been calculated to repel rather than invite a careful scrutiny of works like the Williamsburg dam; for while it provides that any person who fears the destruction of his property or of a highway from an unsafe reservoir, may call out the county commissioners for an examination, yet if his fears are not endorsed by the commissioners he is to be mulcted with the costs and expenses of the whole proceeding." Evidently the legislators who framed this provision had apprehensions like those with which the managers of English railways view the introduction of the American bell-rope, and supposed it likely that persons would cast suspicion on the reservoirs and call out the county commissioners just for the fun of the thing. How great the chances were that the Hampshire County Commissioners would pronounce any complaint frivolous and unfounded may be judged from the fact that in three several examinations they never employed, as the statute authorized them to do, the services of a skilled engineer in determining the character of the original work or viewing it for repairs, and that they rested satisfied with the testimony of the proprietors alone.

The London *Economist* of June 20 contains a paragraph in reference to the recent history of the Emma Mine which we commend to the attention of the public and all whom it may concern. After mentioning that Mr. Albert Grant, the notorious stockjobber through whose instrumentality the mine was brought on the London market, had appeared the other day as defendant in Chancery to a suit brought against him for the recovery of $8,500, part of a sum he had agreed to pay to a Mr. Doulton for "introducing to him a vender of American mines," the *Economist* says:

"More lately there have been certain stormy meetings of the Emma shareholders, who are naturally indignant at finding that they have been long without dividends, and that the shares—which were issued at £20, and which were once we believe quoted upwards of £30—are now salable only at £2, if indeed any considerable quantity of them could be sold for that price. The statements made at the meeting are in curious contrast with those in the prospectus, and should open the eyes of intending investors in public companies to the tricks that may be played with them. The mine was sold, according to the prospectus, as a property yielding £700,000 per annum; and not only so, it was stated that the ore was so abundant and so rich that no attempt had been made to work the mine on commercial principles of economy, and with economy the annual return could be brought up to nearly £800,000—for all which even a million, which was the sum asked, was cheap. But the mine in fact has never yielded anything worth speaking of since the ore which was on the surface when it was sold has been worked up, and Mr. Attwood, the company's engineer, who was sent out by a reformed management to inspect and survey the property, distinctly reported to the two meetings that the mine was in a wretched condition, and that there was nothing to work which would do more than repay the cost of working. The contrast between promise and performance has thus been most painful, and it is difficult to say which is most to be wondered at—the folly of those who believe such statements, or the assurance of those who make them."

The Icelanders, as our readers know, are to celebrate the thousandth anniversary of the settlement of their island during the present summer, and have taken the 1st of August as the proper day, in the absence of any indications as to the precise date. The colonists were, for a long period after their emigration, lost sight of by the rest of the world, and their island had no place on the charts of Northern navigators. The Danish Government now contributes to the occasion a new charter, based on the Danish constitution of 1849, which gives to a local legislature, called the Althing—consisting of thirty-six members, thirty chosen by liberal though not universal suffrage, and six nominated by the crown—exclusive jurisdiction of local concerns, with a minister holding the executive power resident at Copenhagen, and appointed by the King, but responsible to the legislature. His functions, however, in all matters of pressing importance, will be exercised by a Governor residing in the Island. This closes a long and bitter contest between the islanders and the Danish crown, as they have accepted the proferred charter in the most cordial terms, and the King, the first who has ever done so, goes out to be present at the celebration.

There is nothing particularly new or interesting in the situation in France. The chief features of it remain as they were two weeks ago—that is, the Left and Right Centre are somewhat sufficiently alarmed by the progress of Bonapartists to be willing to force on either the definitive establishment of the Republic or the "organization of the Septennat," which some are willing to accept as the equivalent of the Republic, while the Left is willing to accept the Assembly as a constituent body if it creates a government which it likes, but not otherwise—three only of their number refusing to fall into this arrangement, which, by the bye, is a device of Gambetta's, and is procuring him high praise as a "practical man" from some of his admirers abroad. The Monarchists are in the meantime in a bad way, the Duc de Larochefoucauld's proposition for a restoration meeting with no favor anywhere, and the last proclamation extracted from the Comte de Chambord being simply an assurance that he would not be such an out-and-out feudal monarch as some people thought him, but would obey the laws, and would permit a parliament to help him without submitting to its dictation. The Legitimists are now in such a state of perplexity that, as the best thing to which they can turn their hand, they are at this writing organizing another attack on the ministry *apropos* of its having suspended several newspapers, and notably their own organ, the *Union*, for its publication of the Chambord manifesto, and promise an adverse vote of 100 to any clique which will join them in the movement. Marshal MacMahon, in the meantime, is spoiling their little game by making it known that he will not regard defeats of the ministry as involving any change, or, in other words, that he has substituted the Plantagenet or Prussian or Bonapartist system, whichever one likes to call it, for the parliamentary one.

"THE PEOPLE" AND "THE PARTY."

THE term "party obligation" covers two very remote and different things—viz., the tie, real or supposed, which binds one individual to a great number of individuals called the party; and the duty or fidelity which the managing power of a party—*i.e.*, the men who receive power—owe to the men who confer it. During the last thirty or forty years the popular ideas which construed these obligations have passed away and no very definite ideas have taken their place. In looking back little more than a generation, the generally controlling ideas are very plainly perceptible. The first was, that a man having chosen his party, and taken an active part in its proceedings, belonged to it, as a soldier does to an army in which he enlists. For a free and independent citizen then to change his political views was to desert—to become a "turncoat," a "traitor," a "Benedict Arnold." The second idea was that the indefinable personality called a party owed a direct political responsibility to "the people"; that it was to avert disasters and accomplish results, and be judged not by its platforms and promises, but, like military commanders, by its successes. A party was deemed responsible for the agents to whom it confided power, and for it to shift the blame of reprehensible public acts from its impalpable self to its "leaders" or "standard-bearers," or other fighting men, would have been thought as absurd as for a general to solicit public confidence after defeat, for no better reason than that his officers disobeyed orders and his soldiers ran away. In the vernacular of the day—a vernacular that is by no means obsolete—there was a power behind parties called "the people." A member of the party might not turn his coat, that would be disgraceful; but "the people" might put political parties up or down as it saw fit. "The people" was an unseen deity to whom a party owed fealty, and by whom it might be righteously judged. An intelligent foreigner studying our political phrases might have exclaimed: "Is not the people the party, or is not the sum of the two parties the people?" And he would have been answered in some roundabout way, that the people was a power, an authority, supremely wise, whose decrees were final; which might rightfully demand, and did in fact constantly demand, of "the party" the judicious and successful administration of public affairs.

When the facts to which these phrases referred are analyzed, it is plain that "the people" consisted of the one man in a hundred who cared little about "politics," who was not clearly identified with either party, who expressed his disgust by staying away from the polls, and his dissatisfaction by voting the reverse this year of that which he voted last, who treated a political party as an entire unity, and punished it for the mistakes or malfeasances or incompetency of its duly authorized agents. A jury does not hold a railroad corporation to a stricter accountability for the blunders or abuses of its employees than did "the people" hold a party in power accountable for what its "leaders" or "standard-bearers" did or failed to do in public life. The principal was punished for the acts of the agent, and was told, as we now tell a railroad company which has broken our bones, that it had no right to employ a switch-tender who was a fool, or an engineer who could get drunk. Platforms of exalted principles did not serve the party whose Congressmen mismanaged the country, any better than wise and judicious rules help the railroad whose trains have run into each other and killed and wounded a score or two of passengers.

Unphilosophical as it might have been to regard the people as something distinct from the mass of individuals who make up society, the illusion possessed the excellent effect of making the zealous members of a party careful of what they did, and especially careful as to whom they put forward to represent the party in places of official responsibility and power. If the present Republican majority in Congress had lived fifty years ago, and taken it into their heads then to perform any of their recent political somersaults, the most of them would have been finding themselves burnt in effigy at home, and "the party" doing its best to save itself by branding them as "outlaws" and "traitors." So long as it was a well-understood condition of success that a party "must know enough" to select competent representatives, it was almost certain that, before election, political managers would take care whom they put in power, and that, after election, men in office would feel that their acts might cause an amount of political disaster that no ordinary mortal would have the hardihood to face. The result was that the representatives of a party were for the most part about the best men which the party and the locality could furnish, and that they, when in office, acted with a discretion and fidelity which could only spring from a sense of direct responsibility coupled with a knowledge of the immediate ruin which their acts might bring to their political side of the country. There is nothing at the present time which the country so much needs as a restoration of this sense of accountability on the part of both party managers and party representatives; and the greatest blessing that could befall us would be to have parties so closely divided that each would have to do its utmost for the public good in order to maintain its hold of political power.

The old condition of affairs lasted so long as the principal issues before the country were little more than those of administrative ability. But with the graver issues of the slavery conflict and the civil war, the public mind required primarily a declaration of principles—an avowal of the ground upon which each party elected to stand. Political managers were ready enough to yield to this demand. It was much cheaper to furnish the people with good platforms than with good candidates. The graver issues have now passed away, and the old issues of governmental management, though in new forms, have come back to us; but the political managers cling to their cheap nostrums of exalted platforms, and seem to believe that a good declaration of principles will relieve them from everything in the way of performance.

Formerly the figure of a politician "riding two horses" meant that he was avowing two discordant sets of principles at the same time—that he was "high tariff" in Pennsylvania and "free-trade" in South Carolina. An unscrupulous man playing such a part needed to be an adroit one, and the most adroit riders generally came to the ground before they had ridden far. Our modern politicians are not adroit men, and are incomparably below their predecessors in real ability, yet they manage to play their double game more audaciously and with incomparably greater success. The secret lies not in their temerity, but in the fact that they have contrived, or rather fallen upon, a system which enables them to ride their two horses at different times. Mr. Conkling, for instance, can first mount his horse made up of "magnificent principles" and "unexampled political good works" and "untold dangers of Democratic rule," and having successfully ridden through the elections on it, can then mount his other horse of party management and ride through the country as he pleases. These men in Congress do not believe that their unprincipled political bad-faith will injure the party, and they know that, if the party be all right, an entirely different influence than that which regards the public welfare will carry them through the nominating convention. They have divided the community into two parts, and expect to use the honest and conscientious part to carry the elections, and the worthless and unprincipled to select the candidates. The "people"—once so much respected and feared—are to be told, as they have been repeatedly told before, that it was the Republican party which saved the Republic and maintained the Union; but that it was merely a caucus of politicians which has renominated this or that political vagabond for Congress.

It must be evident to any thinking man who will contrast the last national Republican platform with the audacious performances of the Republican Congress elected on the faith of that platform, that we had better speedily adopt one of two methods of treatment. If we are to hold to the old idea of a party being a personality, then we should also hold the personality clearly accountable for the acts of the agents which it selects. If, on the contrary, we take a party for what it is—a voluntary union of ourselves to accomplish some definite object—then the sooner we stop being grateful to ourselves

for what we formerly thought it most judicious to do, the sooner we shall be likely to accomplish some of the ends we are now seeking to attain. An assemblage of sensible men endeavoring to unravel some of the mysteries of social science do not call themselves the "Columbian party," nor set up a shadowy personality to which they all swear allegiance; and if other sensible men uniting for political objects could be induced to take some practical designation instead of an artificial one, it would greatly help them to understand what it is they are trying to accomplish, or failing to accomplish. If one set of our citizens could be induced to forego calling themselves the Democratic party, and forget for a while the something (or nothing) which they now term its "traditions," we might possibly find out what it is that they really propose to do. If the other set would be equally magnanimous in ceasing to term themselves "the great Republican party," and refrain from constant allusions to certain past works and patriotic gratitude, we might then be able to learn which of their promises it is that they really intend to keep. But if, as heretofore, we are to rush into the market-place during the ensuing Congressional election and shout "Great is Diana of the Ephesians," it may be as well for the controlling minority of the community commonly called "the people" to insist that this deity of our own devising can be punished as well as worshipped.

MUNICIPAL POLITICS.

NEW YORK municipal politics, if not a very savory subject of investigation, has at least the merit of furnishing on a small scale a large number of the problems which vex the public mind in national politics. Anybody who wants to study the working of universal suffrage under the least favorable conditions, or the fate of taxpayers under the rule of non-taxpayers; the power of the caucus; the confusing effects of numerous elections and divided responsibility; the comparative merits of election and appointment; the difficulties in the way of trying the great panacea, "the election of none but good men to office"; the proper limits of the province of government; and the works and ways of the average American politician, could hardly do better than take up his residence here, and interest himself actively in the politics of his ward. He would find that he could get as much valuable experience out of one year as five or even ten would afford him in any other part of the country; and when we say this we have Philadelphia and New Orleans, to say nothing of Chicago and Washington, distinctly in our minds.

Just now we are going through a remarkable and apparently inevitable stage in the history of the "reform movement," and it is in the highest degree instructive as an illustration of the difficulties of reform when there is in existence no real reform party—that is, no powerful organization occupied with reform and nothing else. The great difficulty in the way of good city government here, next in order after the character of the city population, has been often explained of late years, and is familiar to nearly everybody. It consists in the fact that the majority in the country has, since 1856, belonged to one party, and the majority in the city to another, which would have been of no great consequence if the city had been treated as—what it really is—a commercial corporation; not, under the influence of mediæval traditions, as a political community. As a political community, it became at once an object of hostility to the majority of the State, in whose hands, contrary to all sound principles, the constitution lodged the power to frame its government; consequently, the legislature has been occupied year after year, not in providing the city with the means of comfort and health, but with devising schemes by which its political power might be held in check or neutralized. In other words, every charter that was framed, and nearly every two years saw the enactment of a new one, had in view not the legitimate objects of a charter—good government, good drains, good police and lights—but the control of votes. This state of things lasted down to 1869, when Tweed hit upon the plan of putting a stop to the interference of the State majority with city affairs by buying up the legislature with hard cash, and it proved perfectly effectual. He was at once permitted to draw his own charter, and to lodge the control of city affairs in his own hands and those of his confederates, and during his short reign the city was for the first time really independent of the State. If Tweed had been "a good man," barring the bribery of the legislators, he might have given the city a first taste of really good government, by dissociating municipal affairs from State and Federal politics, and managing them as those of a commercial corporation. Being what he was, he simply continued the old system in another interest, and added to it the theft of the city funds on an enormous scale.

Everybody knows the history of his overthrow. It took an enormous amount of heat and fury to bring it about, and as usual the spectacle of it filled the heads of vast numbers of excitable people with visions of the millennium. Under the influence of this excitement, a new class of persons, who may be said roughly to have been represented by the Committee of Seventy, and whose interests were identical with those of the city considered as a commercial corporation, came temporarily into power, and they proceeded to draft a charter which was the first carefully considered and prepared instrument of the kind which had ever been presented to the legislature. The legislature, which was momentarily overawed by the reform movement, passed it, but it was set aside for unconstitutionality; and by this time the enthusiasm had begun to flag, the Committee of Seventy to decline in zeal and influence, and the political class to make its way slowly once more to the front. The result was that the next charter was drafted by three or four of the regular political hacks of the Republican party, and was duly mutilated and patched before passage by the Republican majority, which had recovered from its fright. It was not after all what they would have liked to make it, and was better than many of its predecessors, and contained some useful provisions, of which we are now reaping the benefits; but it had the fatal defect of having emanated not from the citizens but from the politicians, and of having been drawn and passed on the avowed theory that the preparation and execution of anything in the nature of reform belonged to the Republican politicians as a matter of right, and pretty much as in the Roman Catholic Church the administration of the sacraments belongs to the clergy. This of course revived once more, and in its full strength, the doctrine that the city is above all things a political community and to be dealt with as such; and in proportion as this doctrine gains or loses strength, the government becomes worse or better.

At this point there arose a curious complication, of which we are just now witnessing the culmination. The citizens, having early reached the conclusion that no great change in the machinery of municipal government was to be looked for, had fallen back on the old and much-loved resource of "electing none but good men to office," and chose for Mayor Mr. Havemeyer, an old and respected resident who had filled the office with credit twenty years previously. A grand fight then arose between the citizens and the politicians as to the extent of the Mayor's power, the citizens seeking to make it as large as possible in order to concentrate responsibility, the politicians seeking to make it as small as possible in order to increase the controllable amount of "spoils," or, in other words, the number of places available for the reward of party services. The politicians carried the day, and the Mayor had to share the appointing power with the Aldermen. There then followed one of the surprises of politics. Mr. Havemeyer, the "good man," turned out to be "a bad man." He put at the head of the police force an old fellow who had commanded it twenty years ago in its early and worst days, and had been out of the service seventeen years, which he had passed as editor and publisher of an obscene newspaper, and into the commissionerships he put politicians of the lowest order, notorious for trickery and corruption, on one of whom, since dead, even graver charges were resting. The public indignation was very great, but he only laughed over it. When a vacancy occurred in the same board he filled it with a very young and unknown man, who had by some means won his favor, and whom he found acting as editor in the office of the city official paper. The indignation

over this was greater than ever, but the Mayor laughed all the more, and his laughter was all the louder because the Republican politicians, having come to the conclusion, after his first exploits, that they could trust him, had gone up to Albany to get the charter so altered as to give him the sole power of appointment in the case of the police commissioners. Two of these commissioners, the survivors of the original batch, have been recently tried and convicted for violation of the election law in removing inspectors of election without notice on election day. They resigned promptly, to avoid removal by the Governor, but the Mayor immediately replaced them by appointing each to the other's place. When remonstrated with, he laughed heartily; and a movement is now on foot to secure the removal of the humorous old gentleman himself by the Governor.

The effect of all this, and indeed of the municipal history of the last two years, has been to produce great apathy and hopelessness even among those who were foremost in 1870 in the work of reform. The men who are most prominent now in seeking to bring Mayor Havemeyer and his police commissioners to justice, are not reformers in any proper sense of the word. They are Tammany politicians, who would, if they got the chance, do what Havemeyer has been doing, and whose main reason for pursuing him is that his course has resulted in damage to themselves. The reformers are weary and disgusted. Apparently, all that has been gained by the reform movement is the suppression of vulgar theft from the municipal treasury. Apart from this, the only visible change, they say, is the substitution of one set of intriguers for another. No new principle of government has obtained recognition in legislation, nor has any new influence been brought to bear in favor of greater decency or purity in the municipal arena. New charters are apparently of no use, because the Republican ringleaders go up to Albany and get them tinkered or altered from time to time to suit their own purposes. There is no use in "electing good men to office," because if there was ever a man whose life seemed to offer guarantees for goodness it was Mr. Havemeyer, and yet he was no sooner elected than he became rampantly bad. If ever there was a movement towards reform which seemed irresistible and likely to prove thorough, it was that of 1870, and what result has it left which is likely to prove permanent?

This gloomy view has a good deal of foundation, but not nearly enough to justify it. The failure of the attempt at reform, so far as the charter is concerned, is something for which both the cause and the remedy must be sought in Federal politics. The performances of Murphy, Bliss, Davenport & Co. in this city during the last three years are the direct consequence of the practice of making the custom-house and the marshal's and district-attorney's offices the headquarters of party propagandism, and the instruments solely of Federal interference in local politics. It is not to be supposed that we are about to witness the immediate or even the early disappearance of this; but a step in the right direction, and one which promises the diminution of its power of mischief, has unquestionably been taken by the abolition of the moiety system. It was what fed the activity of the local Federal politicians, and made them as formidable as they have been in local contests. But the evil will not be wholly removed without a real reform in civil service. This and this only would make the appointment of such persons as Mr. George Bliss of this city, and Mr. Simmons of Boston, impossible. Mayor Havemeyer's follies and eccentricities are perhaps partly attributable to the effects of age on a nature originally both coarse and unscrupulous, but whatever their origin they prove nothing against the principle of concentrating responsibility, as far as possible, in the hands of the Mayor. Nobody who advocated that course when the charter was under discussion two years ago, pretended that persons who were thus charged with great powers would never abuse them. What they said was that if they were abused, we should know whom to blame and whom to punish, which under the old system was well-nigh impossible. The Mayor's recent appointments are bad enough in all conscience, but everybody knows that he and nobody else made them. All the public indignation is therefore concentrated on him, and the remedy is tolerably clear. Nor need we feel at all disheartened by the way in which his antecedents have deceived us. Psychological or physiological—we do not well know which it is—phenomena such as he are certainly rare, but they occur; and all that his case proves is the uncertainty of even the best men. Against his example, Governor Dix, who was elected about the same time and under the same influences, may certainly be set off, and more than repair any damage which Mayor Havemeyer's conduct has done to the plan of increasing the power of the executive. A more independent governor, or one who has more ably discharged the duties of his office with less of fear and less of favor, has not appeared in this State for many a day. In judging Havemeyer, too, it is well to bear in mind that the spirit of contempt for public opinion, and the disposition to treat the offices in his gift as his personal perquisite, to be bestowed just as he pleases, are a legacy left us by the war, which have been as fully displayed in the White House as at the City Hall, and of which it will take years of stern repression to rid us. It is right to add, also, that considerable danger from this quarter will always have to be guarded against in any system of government in which great power and responsibility are lodged in the hands of a single man, and great importance is attached to his taking office. There is enough conceit excited by such a mark of confidence to turn the head of any one who is not restrained by deep-seated political habits and a powerful public opinion.

PAPER MONEY AND SPECIE PAYMENTS IN FRANCE.

PARIS, June 19.

IT has often puzzled me to find an explanation for the extraordinary fact that France, after paying a gigantic ransom and incurring enormous expenses, has not suffered in the same degree as the United States from a system of forced paper currency. The premium on gold never rose very high, and it can be said that at the present moment gold and paper are at par in France, while in America, nearly ten years after the victories of the Union, the premium on gold is still very high.

I have been conversing with eminent financiers on this subject, and the lessons of the last year in France and in Europe may be not without their utility for the United States. This is, I am assured, in all probability, the manner in which the payment of the five milliards of francs has been made to Germany: one milliard only was paid in specie; one milliard was paid with merchandise, in the form of paper on all the great commercial centres in Europe; one milliard in French rentes, which were subscribed by England and Germany at the time of our great war loan; and two milliards were paid with various shares of all countries, which had been bought by the French people before the war. There was a great outcry at the close of the Empire against these foreign investments, but they proved very useful in the end; they served as a mode of exchange with London, Frankfort, and Berlin. Five milliards in value were subtracted from France; how were they replaced? The three milliards of commercial paper or foreign stocks were replaced by French rentes; and it may be said that the exchangeable capital in France has increased rather than decreased, as the loans have amounted in all to seven milliards. The circulating medium before the war was a sum of 1,500 millions in gold; now we have 2,500 millions of notes of the Bank of France. The French rente was issued at the price of 80 and is now worth about 95 francs; the public has, therefore, gained a sum of 900,000,000. Where is really the dark side of this picture is in the addition of 600,000,000 to our yearly budget. The exchangeable capital has become larger, but new taxes have become necessary to the amount of 600,000,000. France, considered as one single capitalist, has borrowed money and seems richer for it, but has to pay an interest of 20 per cent. or 30 per cent. for the addition to her exchangeable capital.

Let us look now at Germany. What has become of our five milliards? 1,500,000,000 have served for the payment of expenses already made; three milliards have been used for the sinking of the debt. The German budget has become lighter in consequence, and 175,000,000 are gained every year. But if the state became prosperous, individuals did not feel at once the benefit of the sinking of the debt; the holders of the national stock were reimbursed to the extent of three milliards, and they had to ask themselves, What shall we do with the money? Well, the money was not well spent; the nation lost its judgment. New banks, new railways, new companies created paper to the amount of seven milliards (while three milliards only were in reality available), and a tremendous crisis was the consequence of

the speculative fever. Many of the new companies lost 50 per cent. of their capital. How did this situation affect the value of gold in the various parts of Europe? The interest on gold fell everywhere—in Germany, in America, in England, while in France it could not fall under 6 per cent. so long as the national loan was issued, which gave this interest to all the subscribers. It happened in consequence that France became a centre of attraction for gold, especially when capital began to avoid the speculative markets of Germany. It so happened that silver and gold began to flow back to the vaults of the Bank of France, which contain now more than a milliard in specie. Under such circumstances, there can be no premium on gold in France, and, apparently, there ought to be no difficulty in the resumption of specie payments. Resumption would bring back even more gold to France—for this reason: As long as we are under the régime of paper money all international transactions must take place in pounds sterling, as the foreign banker or merchant is not willing to add to his risks those which might arise from a variation of exchange. This state of things obliges all the great banks and all the merchants to have a supply of gold in London, which has become a sort of clearing-house for all the affairs of Europe; and this necessity would cease if we resumed specie payments. The same is evidently true for America, and the American supply of gold in the city is probably much larger than the French supply.

I come now to a most difficult question, which I can only treat with much diffidence. How would the resumption of specie payments affect the circulation in France? The Bank has now 2,500,000,000 of bills in circulation, the circulation of bills having been increased by one milliard since 1870. The augmentation in the circulation has been chiefly in small denominations; the bills of 5, 20, 25 amount at present to 800,000,000; but the bills of five francs are rapidly destroyed even now by the Bank as fast as they come in, and replaced by bills of 20 francs. The bills will not come back all at once, and it is probable that the sum total will only fall to the amount of 200,000,000 or 150,000,000, which can be replaced by five-franc pieces, of which there is a great abundance. At the very worst, the public can only in the year 1874 ask 300,000,000 or 400,000,000 from the Bank. The Government is bound to repay 200,000,000 to the Bank yearly till the loan made to the Government of National Defence is completely repaid. Besides, the Bank, having a very large supply of silver and gold, can easily exchange 150,000,000 of small notes against specie; and if it became necessary, the Bank could realize half of the enormous capital which it holds in French rentes. The resources of the Bank are therefore very large; they are the reimbursements of the state, the superabundance of silver in its vaults, and, thirdly, its capital of 200,000,000 in French rentes. With these means it seems as if the Bank could face all difficulties. The resumption of specie payments four years after the war, and one year after the payment of the last milliard of our ransom, would be a great moral and financial victory for France. From a purely financial point of view no objections can be made against this measure. It is, perhaps, not unobjectionable from other points of view.

The facility which France has shown in fulfilling her financial engagements has excited the jealousy of Germany, all the more that the sudden influx of the French milliards on her own soil produced a momentary financial crisis, as a consequence of the overheated speculative hopes of the country. It would be as foolish to say that Germany has been impoverished by the war as to say that France has been enriched. In point of fact, a burden of 600,000,000 has been added to the French yearly expenses, and as much as 175,000,000 has been taken off the shoulders of Prussia. In the long run, the state and the individuals who compose the state have the same interests, and are subject to the same fortunes; but during a short period of time it may sometimes appear that the state has become poorer while the individual has become richer, and *vice versa*. This is the case now in France; there is as much show of wealth, more gambling, more superficial prosperity than ever; the paper money helps to create the illusion; the paper notes circulate more rapidly than the heavy silver pieces. But is the nation richer? No, indeed; it is poorer to the amount of the capital which the war has destroyed, and especially to the amount of capital which Alsace and the annexed part of Lorraine represent; and this last amount is almost stupendous, if we take in all the elements of wealth of Alsace in natural products and in men. France must be taught that she is poorer; otherwise she will persuade herself that even defeat has no dangers for her, that she is like the phœnix of the fable. And what can teach her better that she is not what she was than paper money and a forced currency? Where can the pinch be better felt? To be sure, there is no premium on gold; but still every peasant understands that the Bank for the last three years has been unable to pay its bills in specie, that we have been living on the credit which we have given to ourselves; and this knowledge acts like a refrigerant on the minds of all thinking men.

It is well understood here that Germany regrets not having imposed a heavier fine on France. Germany sees only the surface of things; she does not perceive all the sufferings, the miseries which are felt now among all classes, especially among the commercial classes of the towns; she has only heard the boasts of M. Thiers, and she may believe that we do not really suffer. The resumption of specie payments would accredit this opinion; and there would perhaps be a positive danger for France in the conviction that France has hardly been made poorer by the war.

In America such reasons cannot be given. America has not been conquered; the Union has lost no provinces. To be sure, new taxes have been necessary in order to pay the interest on the debt, but the Union has a commanding position, it need fear the jealousy of no neighbor; large silver mines have been opened in various parts of your continent; California, Colorado, and Nevada are as good as the vaults of the Bank of France, filled with silver and with gold pieces; and if the perspective of the resumption of specie payments seems in your country like a fleeting dream, it must be the fault of your economists and statesmen. Such at least is the conviction of all economists on this side of the Atlantic. I am a very indifferent judge myself in such matters. I belong to no sect of political economy, but it has always puzzled me to find so much political experience and sagacity in the United States, and at the same time so little disposition to follow the lessons of experience in matters of finance. I am convinced that the policy of free-trade could not be well applied to a country where industry is not yet organized; but the policy of protection of national labor can only be well defended on the plea that the country must have its own supply of capital; and a perpetual forced currency would tend to prove that this object had not been attained. I speak, however, with the greatest diffidence on these difficult subjects. I have only attempted to prove in this letter that in France, at least, the forced currency has ceased to be a necessity.

RAVENNA.

RAVENNA, June 8.

I WRITE these lines on a cold Swiss mountain-top, shut in by an intense white mist from any glimpse of the under-world of lovely Italy; but as I jotted down the other day, in the ancient capital of Honorius and Theodoric, the few notes of which they are composed, I let the original date stand for local color's sake. Its mere look, as I transcribe it, emits a grateful glow in the midst of the Alpine rawness, and gives a depressed imagination something tangible to grasp while awaiting the return of fine weather. For Ravenna was glowing, less than a week since, as I edged along the narrow strip of shadow binding one side of the empty, white streets. After a long, chilly spring, the summer this year descended upon Italy with a sudden jump and a terrible vehemence of purpose. I stole away from Florence in the night, and even on top of the Apennines, under the dull starlight and in the rushing train, one could but sit and pant perspiringly. At Bologna I found a festa, or rather two festas, a civil and a religious, going on in mutual mistrust and disparagement. The civil one was the now legal Italian holiday of the Statuto; the religious, a jubilee of certain local churches. The latter is observed by the Bolognese parishes in couples, and comes round for each couple but once in ten years—an arrangement by which the faithful at large ensure themselves a liberal recurrence of expensive processions. It was not my business to distinguish the sheep from the goats, the prayers from the scoffers; it was enough that, melting together under the scorching sun, they made the picturesque city doubly picturesque. The combination at one point was really dramatic. While a long procession of priests and young virgins in white veils bearing tapers was being organized in one of the streets, a review of the King's troops was going on outside of the town. On its return, a large detachment of cavalry passed across the space where the incense was burning, the pictured banners swaying, and the litany being droned, and checked the advance of the little ecclesiastical troop. The long vista of the street, between the porticoes, was festooned with garlands and scarlet and tinsel; the robes and crosses and canopies of the priests, the clouds of perfumed smoke, and the white veils of the maidens, were resolved by the hot, bright air into a gorgeous medley of colors, across which the mounted soldiers went rattling and flashing like a conquering army trampling over an embassy of propitiation. It was, to tell the truth, the first time an Italian festa had worn to my eyes that warmth of coloring, that pictorial confusion, which tradition promises; and I confess that my eyes found more pleasure in it than they found an hour later in those masterpieces of the Bolognese school which hang in the Pinacotheca.

For Ravenna, however, I had nothing but smiles—grave, philosophic smiles, such as accord with the tranquil, melancholy interest of the place. I arrived there in the evening, before, even at drowsy Ravenna, the festa of the Statuto had altogether put itself to bed. I immediately strolled

forth from the inn, and found it sitting up a while longer on the piazza, chiefly at the café door, listening to the band of the garrison by the light of a dozen or so of feeble tapers, fastened along the front of the palace of the Government. Before long, however, it had dispersed and departed, and I was left alone with the grey illumination and with an affable citizen, whose testimony as to the manners and customs of Ravenna I had aspired to obtain. I had already observed to sufficient purpose to borrow confidence to suggest deferentially that it was not the liveliest place in the world, and my friend admitted that in fact it was a trifle sluggish. But had I seen the Corso? Without seeing the Corso it was unfair to conclude against Ravenna. The Corso of Ravenna, of a hot summer night, had an air of surprising seclusion and repose. Here and there in an upper, closed window glimmered a light; my companion's footsteps and my own were the only sounds; not a creature was within sight. The suffocating atmosphere helped me to believe for a moment that I was walking in the Italy of Boccaccio, hand-in-hand with the plague, through a city which had lost half its population by pestilence and the other half by flight. I turned back into my inn, profoundly satisfied. This at last was old-world dulness of a prime distillation; this at last was antiquity, history, repose.

This impression was largely confirmed and enriched on the following day; but it was obliged, at an early stage of my explorations, to give precedence to another—the lively realization, namely, of my imperfect acquaintance with Gibbon and other cognate authorities. At Ravenna, the waiter at the café and the coachman who drives you to the Pine-Forest allude to Galla Placidia and Justinian as to any attractive topic of the hour; wherever you turn you encounter some peremptory challenge to your accomplishments in chronology. For myself, I could only attune my intellect vaguely to the intensely historical character of the place—I could only feel that I was breathing an atmosphere of records and relics. I conned my guide-book and looked up at the great mosaics, and then fumbled at poor Murray again for some intenser light on the court of Justinian; but I can imagine that to a visitor more intimate with the originals of the various great almond-eyed mosaic portraits in the vaults of the churches, these extremely curious works of art may have a really formidable interest. I found Ravenna looking by daylight like a vast, straggling, depopulated village. The streets with hardly an exception are grass-grown, and though I walked about all day I failed to perceive a single wheeled vehicle. I remember no shop but the little establishment of an urbane photographer, whose views of the Pine-Forest gave me an irresistible desire to transport myself thither. There is no architecture to speak of, and though there are a great many large domiciles with aristocratic names, they stand cracking and baking in the sun in no very comfortable fashion. The houses for the most part have a half-rustic look; they are low and meagre and shabby and interspersed with high garden walls, over which the long arms of tangled vines hang motionless into the stagnant streets. Here and there in all this dreariness, in some particularly silent and grassy corner, rises an old brick church with a façade more or less spoiled by cheap modernization, and a strange cylindrical campanile, pierced with small arched windows and extremely suggestive of the fifth century. These churches constitute the palpable interest of Ravenna, and their own principal interest, after thirteen centuries of well-intentioned spoliation, resides in their unequalled collection of early Christian mosaics. It is in a certain sense a curiously simple interest, and it leads one's reflections along a narrow and definite channel. There are older churches in Rome, and churches which, looked at as museums, are more variously and richly entertaining; but in Rome you stumble at every step upon some curious pagan memorial, often beautiful enough to lead your thoughts wandering far from the primitive rigidities of the Christian faith.

Ravenna, on the other hand, began with the church, and all its monuments and relics are harmoniously rigid. By the middle of the first century it possessed an exemplary saint—Apollinaris, a disciple of Peter—to whom its two finest churches are dedicated. It was to one of these, jocosely entitled the "new" one, that I first directed my steps. I lingered outside a while and looked at the great red, barrel-shaped bell-towers, so rusty, so crumbling, so archaic, and yet so resolute to ring in another century or two, and then went in to the coolness, the shining marble columns, the queer old sculptured slabs and sarcophagi, and the long mosaics, scintillating under the roof, along the wall of the nave. San Apollinare Nuovo, like most of its companions, is a magazine of early Christian odds and ends; of fragments of yellow marble encrusted with quaint sculptured emblems of primitive dogma; great rough troughs, containing the bones of old bishops; episcopal chairs with the marble worn narrow with centuries of pressure from the solid episcopal person; slabs from the fronts of old pulpits, covered with carven hieroglyphics of an almost Egyptian abstruseness—lambs, and stags, and fishes, and beasts of theological affinities even less apparent. Upon all these strange things the strange figures in the great mosaic panorama look down, with colored cheeks and staring eyes, life-like enough to speak to you and answer your wonderment, and tell you in bad Latin of the decadence that it was in such and such a fashion they believed and worshipped. First, on each side, near the door, are houses and ships and various old landmarks of Ravenna; then begins a long procession, on one side, of twenty-two white-robed virgins and three obsequious magi, terminating in a throne bearing the Madonna and Child, surrounded by four angels; on the other side, of an equal number of male saints (twenty-five, that is) holding crowns in their hands and leading to the Saviour, enthroned between angels of singular expressiveness. What it is these long, slim seraphs express I cannot quite say, but they have an odd, knowing, sidelong look out of the narrow ovals of their eyes which, though not without sweetness, would certainly make me feel like murmuring a defensive prayer or so if I were to find myself alone in the church toward dusk. All this work is of the latter part of the sixth century and brilliantly preserved. The gold backgrounds twinkle as if they had been inserted yesterday, and here and there a figure is executed almost too much in the modern manner to be interesting; for the charm of mosaic work is, to my sense, confined altogether to the infancy of the art. The great Christ, in the series of which I speak, is quite an elaborate picture, and yet he retains enough of the orthodox stiffness to make him impressive in the simpler, elder sense. He is clad in a purple robe, like an emperor, his hair and beard are artfully curled, his eyebrows arched, his complexion brilliant, his whole aspect such a one as the popular mind may have attributed to Honorius or Valentinian. It is all very Byzantine, and yet I found in it much of that interest which is inseparable, to a facile imagination, from all early representations of the Saviour. Practically, they are no more authentic than the more or less plausible inventions of Ary Scheffer and Holman Hunt; but they borrow a certain value, factitious perhaps but irresistible, from the mere fact that they are twelve or thirteen centuries less distant from the original. It is something that this is the way people in the sixth century imagined Jesus to have looked; the image is by so much the less complex. The great purple-robed monarch on the wall at Ravenna is at least a very potent and positive Christ, and the only objection I have to make to him is that, though in this character he must have had a full apportionment of divine foreknowledge, he betrays no apprehension of Dr. Channing and M. Renan. If one's preference lies, for distinctness' sake, between the old narrowness and the modern complexity, one must admit that the narrowness here has a very grand outline.

I spent the rest of the morning in picturesque transition between the hot, yellow streets and the cool, grey interiors of the churches. The greyness everywhere was lighted up by the scintillation, on vault and entablature, of mosaics more or less archaic, but always brilliant and elaborate, and everywhere, too, by the same keen wonderment that, while centuries had worn themselves away and empires risen and fallen, these little cubes of colored glass had stuck in their allotted places and kept their freshness. I have no space to enumerate the Ravennese churches one by one, and, to tell the truth, my memory of them has already become a sort of hazy confusion and formless meditation. The total aspect of Ravenna, its sepulchral stillness, its absorbing perfume of evanescence and decay and mortality, confounds the distinctions and blurs the details. The cathedral, which is very vast and high, has been excessively modernized, and was being still more so by a lavish application of tinsel and cotton-velvet in preparation for the centenary feast of St. Apollinaris, which befalls next month. Things on this occasion are to be done handsomely, and a fair Ravennese informed me that a single family had contributed three thousand francs towards a month's vesper-music. It seemed to me hereupon that I should like in the August twilight to wander into the quiet nave of San Apollinare, and look up at the great mosaics through the resonance of some fine chanting. I remember distinctly enough, however, the tall basilica of San Vitale, of octagonal shape, like an exchange or a custom-house—modelled, I believe, upon St. Sophia at Constantinople. It is very lofty, very solemn, and, as to the choir, densely pictured over on arch and apse with mosaics of the time of Justinian. These are regular pictures, full of movement, gesture, and perspective, and just enough sobered in hue by time to look historic and venerable. In the middle of the church, under the great dome, sat an artist whom I envied, making at an effective angle a picture of the choir and its broken lights, its decorated altar, and its encrusted, twinkling walls. The picture, when it is finished, will hang, I suppose, on the library wall of some person of taste; but even if it is much better than is probable (I didn't look at it), all his taste will not tell the owner, unless he has been there, in just what a soundless, mouldering, out-of-the-way corner of old Italy it was painted. An even better place for an artist fond of dusky architectural works, except that here the dusk is excessive and he would hardly

be able to tell his green from his red, is the extraordinary little church of the Santi Nazaro e Celso, otherwise known as the mausoleum of Galla Placidia. This, perhaps, on the whole, is the most impressive and picturesque spot in Ravenna. It consists of a sort of narrow, low-browed cave, shaped like a Latin cross, every inch of which, except the floor, is covered with dense symbolic mosaics. Before you and on each side, through the thick, brown light, loom three enormous barbaric sarcophagi, containing the remains of potentates of the Lower Empire. It is as if history had burrowed under ground to escape from research, and you had fairly run it to earth. On the right lie the ashes of the Emperor Honorius, and in the middle those of his sister, Galla Placidia, a lady who I believe had great adventures. On the other side rest the bones of Constantius III. The place is like a little natural grotto lined with glimmering mineral substances, and there is something quite tremendous in being shut up so closely with these three imperial ghosts. The shadow of the great Roman name seems to tread upon the huge sepulchres and abide for ever within the narrow walls.

But there are other memories attached to Ravenna beside those of primitive bishops and degenerate emperors. Byron lived here and Dante died here, and the tomb of the one poet and the dwelling of the other are among the regular objects of interest. The grave of Dante, it must be said, is anything but Dantesque, and the whole precinct is disposed with that curious vulgarity of taste which distinguishes most modern Italian tributes to greatness. Dante memorialized in stucco, even in a slumbering corner of Ravenna, is not a satisfactory spectacle. Fortunately, of all poets he least needs a monument, as he was pre-eminently an architect in diction, and built himself his memorial in verses more solid than Cyclopean blocks. If Dante's tomb is not Dantesque, neither is Byron's house Byronic, being a homely, shabby, two-storied dwelling, directly on the street, with as little as possible of isolation and mystery. In Byron's time it was an inn, and it is rather a curious reflection that 'Cain' and the 'Vision of Judgment' should have been written at a hotel. Here is a commanding precedent as to self-abstraction for tourists who are at once sentimental and literary. I must declare, indeed, that my acquaintance with Ravenna considerably increased my esteem for Byron and helped to renew my faith in the sincerity of his inspiration. A man so much *de son temps* as Byron was, can have spent two long years in this profoundly stagnant city only by the help of taking a great deal of disinterested pleasure in his own genius. He had indeed a notable pastime (the various churches, by the way, are adorned with monuments of ancestral Guicciolis); but it is none the less obvious that Ravenna, fifty years ago, would have been an intolerably dull residence to a foreigner of distinction unprovided with a real intellectual passion. The hour one spends with Byron's memory, then, is a charitable one. After all, one says to one's self, as one turns away from the grandiloquent little slab in the front of his house and looks down the deadly provincial vista of the empty, sunny street, the author of so many superb stanzas asked less from the world than he gave to it. One of his diversions was to ride in the Pineta, which, beginning a couple of miles from the city, extends for some twenty-five miles along the sands of the Adriatic. I drove out to it for Byron's sake, and Dante's, and Boccaccio's, all of whom have interwoven it with their fictions, and for that of a possible whiff of coolness from the sea. Between the city and the forest, in the midst of malarious rice-swamps, stands the finest of the Ravenna churches, the stately temple of San Apollinare in Classe. The Emperor Augustus constructed hereabouts a harbor for fleets, which the ages have choked up, and which survives only in the title of this ancient church. Its extreme loneliness makes it doubly impressive. They opened the great doors for me, and let a shaft of heated air go wander up the beautiful nave, between the twenty-four lustrous, pearly columns of *cipollini* marble, and mount the wide staircase of the choir, and spend itself beneath the mosaics of the vault. I passed a delicious half-hour sitting there in this wave of tempered light, looking down the cool, grey avenue of the nave, out of the open door at the vivid green swamps, listening to the melancholy stillness. I rambled for an hour in the Pineta, between the tall, smooth, silvery stems of the pines, beside a creek which led me to the outer edge of the wood and a view of white sails, gleaming and gliding behind the sand-hills. It was infinitely picturesque; but, as the trees stand at wide intervals, and bear far aloft in the blue air but a little parasol of foliage, I suppose that, of a glaring summer day, the forest was only the more Italian for being perfectly shadeless.

Correspondence.

THE "LEADEN STATUARY."

To the Editor of the Nation:

Sir: While it is matter of rejoicing to the numerous friends and well-wishers of Phelps, Dodge & Co. that the firm is able to spread before the public so conclusive a refutation of the slanders of Butler as you publish in the *Nation* of July 2, it is to be regretted, in relation to charge No. 1 (about the metal statuary), that the reply contains something that will strike many as an evasion of the essential point.

What the public wants to know is, whether any of the gentlemen that now compose the firm of Phelps, Dodge & Co. have, at any time, cheated, or sought to cheat, the Government by means of that statuary fraud.

The published statement of the firm admits, by implication, that the thing was done by somebody. It says, indeed, the importations "*were made.*" But when? and by whom? The answer is, "Before *the firm* came into existence." Very good, but the gentlemen themselves whose conduct is now the subject of discussion—were *they* in existence? and did they, or any of them, have any part in this fraud? To say that the senior member of the firm was, "at the time, engaged in the dry-goods business," is such a reply—with all respect and deference be it said—as a smuggler of silks and brandies at Black Rock might make. "Smuggling, indeed! Why, bless your honor's heart, I was in the passenger business, and was, 'at the very time specified,' *running a ferry-boat.*"

William Waith.

Lancaster, N. Y.

[It is melancholy to have this story coming up again after all that has been written about it. Mr. David A. Wells told "the true story of the leaden statuary" in a most entertaining and instructive letter to the New York *World* of May 11. No member of the present firm of Phelps, Dodge & Co. had anything whatever to do, directly or indirectly, with the importation of the leaden statuary, which occurred as long ago as 1828, and not one of them was in the metal business at that time. Moreover, the predecessors of the present firm, Phelps & Peck, had nothing to do with it either, though they were then extensive importers of lead. The story, as far as both are concerned, is a myth without any foundation whatever, but which has been circulating through the country for years, both as a capital joke and as a remarkable example of human depravity. We may give the finishing-touch to it by saying that, as Mr. Wells shows, the men who did import the lead in statues did nothing wrong and nothing clandestine. They imported it openly, and under a defective clause in the tariff, which was only one of several; and imported it not in New York, but Boston; and their right to do so was tried in the United States District Court, Daniel Webster appearing for the defence, and the judge instructed the jury to find for the importer, which they did, and there the matter ended. That so despicable and base a man as Butler should have the power to convert the House of Representatives for long hours into an audience for his slanderous vituperation, is one of those facts which ought to set people blushing instead of investigating. —Ed. Nation.]

Notes.

J. W. Bouton will shortly begin issuing, in ten parts, at $2 50 each, Mr. Geo. H. Felt's 'Kaballah of the Egyptians and the Greek Canon of Proportion.' We have once or twice spoken of this work at some length, and will only append here the rest of the title: "the normal law of being and of beauty applied to art, sculpture, architecture, symbolism, language, natural law, and science, and the deciphering of the hidden meaning of the sculptured and written Egyptian and Hebraic religious records." The size of the book will be 4to, pp. c40, and it will contain more than a thousand illustrations.——J. B. Lippincott & Co. announce as in press a work on the 'Recent Origin of Man,' by James C. Southall.——In No. 6 of Trübner & Co.'s 'Catalogue of Choice, Rare, and Curious Books' will be found a very select and catholic list of works of the above description pertaining to the "science of religion," from Catlin's 'O-Kee-Pa' to the Zend-Avesta, or from Bleek's 'Hottentot Fables' to Dupuis's 'Origine de tous les Cultes.' The Catalogue contains also, under Americana, a number of distinctively religious works, including a Roger Williams rarity of 1644 ('Mr. Cotton's Letter lately printed, examined, and answered'), for which $225 is asked. ——Besides the honor paid to Prof. Lowell by Cambridge University, England, of which we lately made mention, the same degree (LL.D.), the highest in its gift, has been bestowed on Mr. Robert C. Winthrop, of Boston, whose ancestor was a member of Magdalen College, Oxford. The University also voted a D.C.L. to Mr. David A. Wells, a high and well-won honor, the for-

mal bestowal of which this year was only prevented by his absence from England. He will doubtless go over next year to receive it.

—In Part ii. of Vol. XII. of the 'Essex Institute Historical Collections,' an interesting account is given of the voyages of the *Mary and Ellen* and *Eliza* from Salem to California in 1848–9. These were the first two vessels which sailed direct from Massachusetts to San Francisco with an assorted cargo and passengers, in consequence of the news of the gold discoveries on the Pacific Coast. The former was 152, the latter 160, days in the passage, and those who came out in them were greatly surprised a year later at the arrival of two small clipper tea-ships, with assorted cargoes from New York, in a little over 100 days. By January 1, 1851, Flint, Peabody & Co. had ready the first clipper-ship built expressly for the California trade, called the *John Bertram*, after their eminent associate of that name, and then followed the *Witch of the Wave* and the long line of clippers famous for their quick trips to California and the East Indies. The *John Bertram* carried as part of her cargo ten thousand dozens of eggs, put up in tins, which brought $10,000, as well they might in a country where eggs in 1849 cost two dollars per dozen, milk the same per gallon, and a squash the same, so that a batch of "home-made" Yankee pies was a luxury to be indulged in only at rare intervals. Not every venture in those days was certain of returning a profit. Mr. Peabody tells of seeing in one of the worst crossings in San Francisco some half-dozen or more boxes of tobacco, of a hundred and twenty pounds weight, together with barrels of spoiled provisions; and, as stepping-stones generally, the gold-washers "which came out in almost every vessel, and were of no value." His firm sent out to their farm a large number of fruit-trees of the choicest varieties, "but when they came into bearing, so many others had done the same thing that fruit could not be marketed to pay expenses." The ice-trade established in 1853 by Mr. Bertram and others with Flint, Peabody & Co. was finally given up on account of the competition from Sitka. Since 1854 there has been a steady falling-off in the quantity of goods shipped to California from the East, owing to the growth of native products, and in 1873 but two ships loaded in Boston for San Francisco. The *Eliza* was the first vessel of her draft that ever went up the river to Sacramento. She never came down, being used, till sold and broken up in 1868, as a store, store-house, boarding-house, and later for years as a landing for steamers. As she was built at Salem in 1822, she had lasted forty-six years. The *John Bertram*, built as we have said in 1851, is still running, we believe from this port, and is doubtless good for another score of years at least, the "life" of a ship being much like that of a tree—of indefinite duration, subject to accident and decay. One of the ships built in New Bedford by the father of the late Henry Grinnell, and always owned and run by that family, was sixty-one years of age when destroyed by the Confederate cruiser *Shenandoah*.

—The seventh annual report of the trustees of the Peabody Museum of American Archæology and Ethnology consists chiefly of the report of the curator, Dr. Jeffries Wyman. It closes with an interesting discussion of the evidences of cannibalism among the American aborigines furnished by human remains discovered in the shell-heaps of the St. John's River, East Florida. Dr. Wyman enumerates ten instances in which such remains were found, mostly from one to two feet below the surface, under the following general conditions: They were not the result of burial; they were widely scattered about, so that the complete skeleton could seldom be found, and in one case the cranium was wholly missing; they were systematically broken, the skulls into a great number of fragments, the arm and leg bones in the same manner as were those of edible animals like the deer, alligator, etc.; they often showed the marks of a cutting-instrument, but gave no evidence of having been broken or gnawed by dogs or wild beasts; "the fractures as well as the disorder in which the bones were found evidently existed at the time they were covered up, as is shown by the condition of the broken ends, which had the same discoloration as the natural surfaces." The discoveries were made by chance, without special indications before searching, and the probability is that many more such remains have escaped the light. In most of the cases cited by Dr. Wyman a single skeleton was found; but the oldest remains, from the Osceola Mound, belonged to two skeletons easily distinguishable in parts. As for the age of the victims: on Huntoon Island, near the creek of the same name, the bones were of an adult dwarf, about three and a half feet high; in one of the conical mounds hitherto supposed to be burial-places, they were of a young person. All these circumstances point strongly if not irresistibly to cannibalism, and Dr. Wyman corroborates this inference by citing a number of authorities in regard to the early practice of cannibalism on both the American continents. After mentioning the Caribs as the tribe that had the greatest fondness for human flesh, he says: "It was also practised among the Iroquois, Algonquins, Mamis, and Kickapoos; it existed in Louisiana, Illinois, and on the northwest coast"; and he quotes from the Jesuit 'Relations' some of the truly fiendish atrocities which preceded the feast of the enemy taken in war. We presume he might have affirmed with safety that cannibalism is still indulged in by certain of our tribes, at least towards their enemies. In Vol. IV. of the *Nation*, p. 300, convincing proof was adduced that the Tonkawas and Comanches of Texas were, even down to that date (1867), in the habit of eating each other, and if they ever have the chance nowadays they doubtless may still do so. The Tonkawas, it should be observed, thought broiled Comanche a great delicacy, and Col. James Bowie, the inventor of the bowie-knife, who once partook of it on request, declared himself of the same opinion.

—The first volume of MM. Brachet and Paris's competent translation of Diez's 'Grammar of the Romance Languages' has appeared (8vo, pp. 476). The price is twelve francs. With the third volume is concluded M. Georges d'Heylli's 'Journal du Siége de Paris,' a compilation rich in materials, official and unofficial, and furnishing in the last of its appendixes an alphabetical list of works relating to the siege. Students of another period of history will find their profit in the forthcoming 'Bibliographie Générale des Gaules,' a work containing some nine thousand titles classified both alphabetically and methodically. M. Charles Emile Ruelle is the editor. Another Emile—the ex-minister Ollivier—has published his suppressed discourse on Lamartine, with a preface reviewing the incidents of the opposition to its public delivery before the Academy. In this preface, according to an unfriendly critic (*Polybiblion* for June), the pronoun of the first person occurs eighty-two times, an average of once every five lines or thirty-eight words; and this counting only the nominative case. But some other proof of egotism might be demanded in a case of strictly personal defence, in which, among other things, M. Ollivier's "cœur léger" had to be got over, and required no less than six pages. Two hundred and fifty Russian authors who have published their works in French alone are recorded in Gregory Ghennady's 'Ecrivains franco-russes,' a thinnish catalogue of less than a hundred pages. A work doubly illustrating the art preservative of arts, being valuable both for its instruction and for its elegant typography, is Théotiste Lefèvre's 'Printing Compositor's Practical Guide' (Guide pratique du compositeur d'imprimerie), in two volumes 8vo, of upwards of 700 pages. The price is 23 francs, which is probably less than would be asked for any translation of the work brought out in this country, although in a far less sumptuous style. Perhaps some of our publishers might think this worth attempting. It is a little surprising that there are, among the well-to-do, so few amateur printers, considering the opportunities afforded by this occupation for gratifying one's mechanical and æsthetic tastes at no great expense.

—To the *Mecklenburgische Zeitung* of May 10 Friedrich Latendorf contributes an interesting chapter on the initial devices in use among the princes and nobility of Germany towards the close of the sixteenth century. No clue has been found to many of these, and an endless field is opened up to those curious in such matters of research. The writer enumerates half a dozen authorities, new and old, from whom he has derived assistance, and he has added a large number of conjectures and positive interpretations of his own. We must content ourselves with selecting a very few samples from a very long list. The letter G stands in nearly every instance for the name of Deity, as in A. G. T. I. (*Auf Gott trau ich*—In God is my trust), or in the very favorite formula M. H. Z. G. (*Meine Hoffnung zu Gott*—My hope is in God)—both mottoes of the Dukes of Brunswick, 1590. A. I. G. H. (*Alles in Gottes Hand*—Everything is in God's hand): Bartolt von Mandelschlo, 1594. G. H. M. V. A. M. (*Gott helfe mir und allen meinigen*—God help me and all of mine): Werner von Bevessen, 1587. H. G. M. F. (*Herr Gott mich führ*—Lord God direct me): Wolff Marschalch, 1589. B. D. E. (*Bedenk das End*—Consider the end): Johan von Exterde, 1596. Rhyming mottoes were not infrequent; thus, omitting further mention of the bearers of them: I. W. G. V. (*Ich wags, Gott vermags*—I undertake, God avails), and the parallel one, I. W. G. W. (*Ich wags, Gott walts*); N (Z). G. V. E. S. M. B. (*Nach* or *Zu Gott und Ehren steht mein Begehren*—For God and honor is my desire); W. G. V. H. W. G. (*Wer Gott vertraut, hat wohl gebaut*—He builds well who puts his trust in God), of which the shorter form, G. V. W. G., also obtains. Resignation was expressed in mottoes like W. G. W. (*Wie* or *Was Gott will*—As God wills), otherwise H. W. D. W. (*Herr, wie Du willst*—Lord, as Thou wilt), and W. G. G. S. G. M. A. (*Wies Gott gefällt, so gefällt mirs auch*—God's pleasure is mine also). A few devices are alliterative, and these as often as not are found to be Latin, *e.g.*, D. D. D. (*Donum desuper datur*—Gifts come from above).

—R. Haym, whose article on 'Herder und die *Königsberger Zeitung*' we called attention to in No. 442, has carried his investigations into articles by Herder in this newspaper further in Nos. 11, 13, and 16 of *Im Neuen Reich*. None of these contributions is signed unmistakably by Herder; their

authorship has to be proved by comparison with his other writings; and they are not to be spoken of as giving valuable reflections that Herder's writings do not present elsewhere. They have, however, a certain biographical interest.—To No. 17 W. S. Teuffel, the last historian of Roman literature, contributes an article on 'Die horazische Lyrik und deren Kritik,' estimating the position of Horace as a poet rather from the English point of view—as a poet of varying worth of composition, though on the whole high—than after the German disintegrating method, which cuts out as ungenuine passages and poems that do not commend themselves to the critic's taste.

LORD DENMAN.*

LORD DENMAN was born in 1779 and died in 1850. By descent and by conviction, he belonged to the Whigs. He took part in the defeats, in the struggles, and in the ultimate triumph of his party. Both in his career and in his intellect and character he was a typical representative, and a very noble representative, of the great body of Liberals who, at the beginning of the century, commenced what then seemed a desperate battle on behalf of principles which are now accepted by every English statesman. It is this perfect identification between Lord Denman and the party to which he belonged which makes his life worth careful study. In him may be seen all the best points, and some of the weak ones, which distinguished the Whigs. The very fact that he was not, like Brougham, a man of marked individuality, makes him all the more correctly reflect the character of his associates and leaders. "The greatest of all political evils," he writes in 1832, "I have always thought was this: injustice, deliberately perpetrated or wilfully persisted in by the state. My own opinion has uniformly been that injustice and wrong, whenever detected, ought to be instantly swept away. Like everything that prevails, it will by degrees strengthen itself by inveterate habits and factitious interests, and even the disinterested will grow in time accustomed and indifferent. . . . Shake off the bad principle while you may, and scan not too nicely the inconveniences or even dangers which may result from the success of your exertions. Peel's bill on the currency, the Repeal Act, and Catholic Emancipation are examples of what I mean." These sentences strike the key-note of Denman's life. Whenever he met with a real or imagined abuse, he struck at it with all his force. Occasionally, no doubt, he gained popularity by his exertions—as, for example, when, throwing himself heart and soul into the defence of Queen Caroline, he described the Duke of Clarence as "the slanderer," and incurred the permanent enmity of George IV. by the application to that most contemptible sovereign of a classical quotation which appeared (though contrary to Denman's intention) to impute to the king vices of which even he was incapable. But on the whole, and this is a point which modern readers should constantly bear in mind, Denman's hatred of injustice delayed his success, and might, for all he knew, have proved fatal to it. And what is true of Denman is true of his party. It is easy now to underrate the sacrifices made by the Liberal Opposition at the time when Toryism was triumphant; but no impartial judge can doubt either that the Whigs were actuated in the main by a sincere hatred of patent abuses, or that both they themselves and their opponents thought that their efforts in favor of practical reforms might end in failure and in their own political ruin. Denman's creed, as enumerated in the letter we have cited, is very characteristic both of the writer and of the Whigs in other respects than in the honest zeal which it discovers for the promotion of justice. It makes perfectly clear that Denman, though described by a poetical friend as a "dear lawless democrat with awful brow," never was either lawless or, in the modern sense of the word, a "democrat." He obviously considers that no man of sense could be a republican, and expresses a conviction that it was absolutely impossible that Romilly should ever have been a "bigoted republican," because "the universal estimate of Romilly's fine understanding would be greatly depreciated by the fact being so." To this may be added that he, in common with his associates, while hating what seemed to him practical abuses, exhibited little enthusiasm for speculative or theoretical reform.

This absence of a complete theory of politics, whether it be looked upon as a merit or a defect, is pre-eminently a Whig trait, and curiously divides men like Denman from the disciples of Bentham or James Mill. Even at the time when Denman and his party appeared, from the mere fact of being in hopeless opposition to the ruling powers of the day, to be most like democrats, you will not find a trace in them either of that intellectual enthusiasm for a political theory which marks the Benthamites, or of that democratic fervor which is characteristic both of the French revolutionists and of all persons who have been influenced by revolutionary sentiment. In another respect, Denman curiously represents the spirit of a generation which has now all but passed away. At every crisis of his life you see traces of that unconquerable happiness of disposition which, combined with his zeal for justice, gave, we suspect, that peculiar charm to his character which gained for him almost universal affection. Now, this happiness of disposition always must be to a great extent an individual gift; but any reader of biography will conclude that a certain buoyant cheerfulness was a marked characteristic of the men with whom Denman was contemporary. Scott, Sydney Smith, Jeffrey, all seem to have possessed this gift of good spirits, and in each of them you can trace that kind of perfect adaptation between the man and his surroundings which is the main source of happiness. Denman's power of enjoyment survived even paralysis, and he was found roaring with laughter at the mistaken pronunciation of a grandchild, when paralysis made it impossible to him to explain in words what it was that amused him. No one can deny Denman's great virtues. No one can dispute that his life was from its beginning to its end a career of unbroken and deserved success. But no candid reader can put down Denman's biography without the feeling that the Chief-Justice, with all his virtues, fails to excite the interest which is often kindled by the history of far less deserving men. In this, as in other points, he shares the fate of his party. The career of the Whigs has been a career of unbroken and deserved success, yet many politicians who did not possess half their substantial merits have excited an amount of sympathy which has never been gained by the men who followed Brougham and Russell. The causes of this result are, it may be conjectured, the same in the case both of the Chief-Justice and of his party. Success and happiness are in themselves the greatest of blessings, but they do not excite a tithe of the interest which is often kindled by dramatic calamity. Denman's perpetual felicity, his amiable letters to amiable colleagues, the compliments which he paid to his puisne judges, and the compliments which they paid him in return, are carefully recorded by Sir Joseph Arnould, and they become not a little wearisome to the reader. In the same way, the success of the Whigs, though highly creditable to their good sense, has not promoted their popularity, and the world has become a little tired of the often-told story of the steps by which civil and religious liberty has been obtained under Whig guidance.

Another and deeper cause may certainly be assigned for the sense of dulness which creeps over the reader as he studies the latter portion of Denman's life. No partiality can conceal the fact that the Chief-Justice attached an exaggerated importance to forms. He has left on record his estimate of the great case of Stockdale *v.* Hansard, and speaks of the struggle which he carried on with the House of Commons as "the most important event of my life, and that on which my future reputation must mainly depend." Now, of the legal merits of this once celebrated case we do not propose to say anything. Any one who wishes to see what can be said on both sides of the question involved should compare the very fair account given by Sir Joseph Arnould with the certainly equally fair account given by Sir Thomas Erskine May in his 'Constitutional History.' Most critics will think that the House of Commons and the Queen's Bench were pretty equally in the wrong. The House was attempting to enforce a just rule in a thoroughly unjust way, and the court, while technically in the right, was attempting to support a rule obviously opposed to public utility. The most curious point is that the manifestly expedient mode of terminating the dispute was not adopted till all parties had been worn out by a contest which, after lasting three years, had placed both the House of Commons and the Queen's Bench in an equally absurd position. But what for our present purpose is most noticeable is Lord Denman's failure to perceive that the struggle in which he was engaged was a sham fight, wherein neither combatant was prepared to proceed to extremes, and which involved no matter of vital importance. Here, as elsewhere in his career, you feel that he mistook forms for realities. The advocate who believed in the perfect innocence of Queen Caroline naturally enough became the judge who saw in the case of Stockdale *v.* Hansard a struggle rivalling in importance Hampden's resistance to ship-money.

This tendency to political formalism, if it was the weakness of Lord Denman, was certainly also the weakness of his party, and in both cases has concealed the substantial services which he and they have rendered to their country. The fame of the Whigs will be found in many cases not really to depend on what party writers would describe as their greatest achievements, and, happily for Lord Denman's reputation, need not be rested on what he deemed the most important event of his life. The party and the man alike will really owe their lasting fame to their intense and consistent love of justice. Sir Joseph Arnould notices with obvious regret the letters in which, late in life and worn out with illness, Lord Denman attacked Dickens for "having taken pains to discourage the efforts then making to put down slavery and the slave-trade," and thus "having done his best to replunge the world into barbarism." The letters were "regrettable" because Dickens was not guilty of the offence charged against him. But

* 'Memoir of Thomas, first Lord Denman, formerly Lord Chief-Justice of England. By Sir Joseph Arnould, late Judge of the High Court of Bombay.' London: Longmans, Green & Co.; Boston: Estes & Lauriat.

the feeling which prompted the old judge to denounce in even violent language the tendency which he truly enough perceived to underrate the horrors of slavery and the slave-trade, is a signal instance of that love of justice and hatred of wrong which was, from beginning to end of Denman's career, the noblest trait in a noble character.

BRIGHAM'S CAST CATALOGUE OF ANTIQUE SCULPTURE.*

A SYSTEMATIC catalogue, in English, of the works of antique sculpture existing in the public and private collections of Europe, would be a desirable and useful book. Mr. Brigham has undertaken to give a list of a considerable number of these works, especially of those of which casts may be obtained, believing that such a list might be serviceable in America in assisting the selection of casts for local collections. In the absence of the originals, casts are important, and with the aid of Mr. Brigham's book a tolerably satisfactory collection of them might be brought together. The photographs with which his volume is illustrated are of interest alike to those who are glad to have their memory of famous originals refreshed, and to those who, not having had opportunity to see the originals, desire to gain some conception of the character of the most famous ancient statues and busts.

Had Mr. Brigham contented himself with giving a simple, however incomplete, descriptive list with these illustrations, he would have produced a book worthy of praise; but he has undertaken something more. He prefixes to his volume an introduction treating of the history of ancient sculpture. He has given some account of the personages, mythical or real, represented in the sculptures which he enumerates, and he has closed his work with what he calls an introduction to the study of ornament. These accompaniments to his list, though the list itself were incomplete, defective in method, and arbitrary in selection, might have added greatly to its value. But we have again the regret (a regret too frequent) of finding a work of good design, and of considerable pretension, by an American, executed in such a manner as to betray the insufficiency of American scholarship and the want of thoroughness of American discipline.

There is a slight test which every scholar applies to a new book in any department with which he is familiar, to gauge the accuracy of its author or compiler and his probable ability to afford trustworthy information—the test of correct spelling. If misprints in citations from foreign languages are frequent, if foreign names are frequently misspelled, especially if a name or word that often recurs is invariably misspelled, the genuine student cannot fail to feel a distrust of the familiarity of the author with the matter in hand, or of his sensitiveness to those minute points on which the real value of his investigation may depend. Mr. Brigham's pages are disfigured by errors that very slight attention would have prevented. He has frequent occasion to refer to the *Towneley* collection in the British Museum. In his pages the name invariably appears as *Townley*. The name *Barberini*, which recurs often, is always printed *Barbarini*. The name *Righetti*, that of the editor of the well-known *Descrizione del Campidoglio*, is always printed *Rhigetti*. In a list of works to which reference is made in the catalogue, which occupies six pages, we have noted twenty misprints—(*photographic* for *photographiques*; *General* for *Général*; *delta* for *detta*; *mausolli* for *mausolei*; *époche* for *époque*, etc., etc.)—no single one of great importance, but, taken together, indicating either ignorance or carelessness, unpardonable in the compiler of such a work.

The character of the two essays with which the book begins and ends confirms the correctness of the inference drawn from the errors of the press. Mr. Brigham's historical introduction shows no grasp of principle, contains many doubtful or inaccurate statements, and is written in a style both jejune and awkward. The same terms are applicable to the essay on "Ornament." The author has imperfect ideas of the principles of ornamentation, and little knowledge of the characteristic features and historic developments of the different styles. The confusion of notions exhibited in such a passage as the following on "Renaissance Ornament" may serve as a warrant of our criticism, and as an excuse for not attempting to justify it by more elaborate illustration: "After the conquest of Constantinople by the Venetians in 1204, that independent city [Venice] threw off the shackles of mediæval art and commenced a new epoch. At first the great change was architectural; the round arch was restored—[when had its use been abandoned?]—and the classical orders as well—[in what works of the thirteenth century?] Ornament was distinguished by delicate scroll-work and intricate net-work [by no means the most characteristic distinctions of the early Renaissance], the latter borrowed from the Saracenic. Niccolo Pisano, Andrea Tuffi [there is no famous artist of this name, Mr. Brigham probably means Andrea Tafi, of whom little is known], Giotto, Orcagna, and Brunelleschi were distinguished masters of this style, which is illustrated in the Cathedral of Florence and the Church of San Francesco di Assisi. From this period the changing style was called the Tre-cento, 1300." What style Mr. Brigham supposed himself to be describing it is impossible to conjecture, or what relation he fancied to exist between the Venetian architecture of the thirteenth century and the Florentine architecture of the fifteenth. There is really no meaning in such writing.

Returning to the list proper, we have to thank Mr. Brigham for numerous serviceable notices of works of sculpture in different European museums. His accounts of special works are mostly simple and to the point, containing a fair amount of information and intelligent description. Had he not gone beyond these notes his list, though imperfect and put together without rational method, might have been commended. But, with his descriptions of the works of sculpture, Mr. Brigham has thought best to unite some account of the personages, real or mythical, whom they represent, and has occasionally added brief reflections to the narrative, by which the reader will be entertained if not instructed. It is a great pity that the inaccuracy visible in the letterpress frequently appears also in the statement of facts. For instance, Mr. Brigham, having occasion to speak of Marcus Aurelius, says of him, "Marcus Aurelius Antoninus was Emperor of Rome after Flavius Claudius," which is as much as to say Abraham Lincoln was President of the United States after Joshua Jefferson; there was more than a century between Claudius and Marcus Aurelius, and the name of Claudius was Tiberius, not Flavius. Mr. Brigham goes on to say, "Although of a cruel disposition, he was renowned for his morality and military skill." This is his character of the mildest of rulers and the author of the 'Meditations'! On the same page he tells us that Augustus was the *second* emperor of Rome. We turn the pages, and open on Pericles, and find it said of him: "In spite of the grand works which he encouraged, it must not be forgotten that he did much to render vice less odious to his fellow-citizens, and, *in the person* of his favorite, Aspasia, *set an example* to the young Athenians that they were only too ready to follow." Having noted so very remarkable a fact, Mr. Brigham may perhaps be excused for omitting to mention some of the other chief claims of Pericles to distinction. Of Phocion we are told that "he devoted his life to the service of his country, and met the usual reward of those who are foolish enough to serve the public."

In speaking of a statue of Sabina, wife of Hadrian, now in the Louvre, Mr. Brigham states that "the statue belongs to those which were made without a head, in order that a portrait-head might be fitted to suit the purchaser. In the case of an empress it was convenient, as her successor need only go to the expense of a new head"! This astounding assertion might puzzle the soundest archæologist. We can but guess at the intended meaning, and suppose Mr. Brigham wished to say that the possessor of a marble figure to which various heads might be fitted could easily, and at no great expense, substitute the head of a new empress in the place of that of her predecessor; but this is very free interpretation, we admit, of the statement that "the successor to an empress need only go to the expense of a new head."

We turn the pages again, and open at "Fauns," who are said by Mr. Brigham to "differ from Satyrs in having human instead of goat legs." Just the reverse was the case, the coarser hand of the Roman showing itself in this instance, as in so many others, in dealing with the subjects of the mythology of the Greeks. But throughout his book Mr. Brigham displays no sense of the essential difference between the Greek and the Roman conceptions of the nature, character, and attributes of the deities and demigods of the religions of the two peoples. Yet unless this difference be clearly recognized and well understood, there can be no satisfactory study of the characteristics of ancient sculpture in its highest field as an expression of the religious sentiment of the nations by whom it was practised.

We have said enough of this disappointing volume.

A MODEL BIBLIOGRAPHY.*

MR. ABBOT'S 'Literature of the Doctrine of a Future Life' was first published in 1862 as an appendix to the Rev. Mr. Alger's 'History of the Doctrine of a Future Life.' Some copies were reprinted separately in 1871, when the whole work reappeared with W. J. Widdleton as publisher instead of Geo. W. Childs & Co. Although some time has elapsed since the original publication of this catalogue, and since it was published separately, though with no alterations, it is a pleasure to call attention to so excellent a piece of work, and to emphasize its merits all the more decidedly now because, in some recent noteworthy articles in the Boston *Advertiser*,

* 'Cast Catalogue of Antique Sculpture. With an Introduction to the Study of Ornament. By William T. Brigham, A.M.' Boston: Lee & Shepard. 1874. 4to, pp. iv.–200. With photographic illustrations.

* 'Literature of the Doctrine of a Future Life; or, A Catalogue of Works relating to the Nature, Origin, and Destiny of the Soul; the titles classified and arranged chronologically, with notes and indices of authors and subjects. By Ezra Abbot.' New York: W. J. Widdleton.

treating in a general way of American accomplishments in the work of cataloguing, the praise is given to the principal Boston catalogues, those of the Athenæum and the Public Library, while Mr. Abbot's equal if not superior deserts obtain not the slightest acknowledgment. We, however, as our readers know, have often quoted Mr. Abbot as a high authority, though we have never attempted a detailed account of his merits. Before this work of Mr. Abbot's, a few bibliographies of works relating to the future life of the soul and kindred questions had been published in Germany, the most considerable of which had been executed by the well-known bibliographer, Grässe. His work, entitled 'Bibliotheca psychologica,' was printed at Leipzig in 1845. In fulness, Grässe's book cannot be compared with Mr. Abbot's, as Grässe's contains only about 1,500 titles, while Mr. Abbot has more than 5,300. Nor are the two books to be put by the side of each other in point of accuracy. Grässe's book appears, as Mr. Abbot says, to have been rather a hasty compilation, with no attempt at completeness. He, however, has the merit of having furnished to hand a very large number of titles, and so of having performed a valuable work, though it was a contribution in the way of a special bibliography that needed a great deal of examination and sifting.

In giving an account of Mr. Abbot's book, one hardly knows whether to praise most the fidelity and the consistency in the treatment of details the most minute and insignificant—if anything in the work of cataloguing can be called insignificant—or the learning, the patience, and the unwearied industry that has gathered information from all open and recondite sources in a great variety of languages, including the Oriental, or the accuracy of the book in presenting the names of authors in fuller form than that in which they appear on the title-pages, or the excellent taste with which the titles are presented to the eye—the skill of the bibliographer here calling to its aid the art of the printer.

Under one of these heads, the fidelity with which authors' names are given, we suppose that there is no single work in which one could look with greater certainty of finding in full the name of the author of a treatise on the soul published before the first printing of this book than in this catalogue. This might perhaps be expected, but one would not understand, until he had himself made the attempt to establish the true name of an author, through how many forms in different languages the author has occasionally to be chased before his name, as he wrote it in the vernacular, is discovered (J. C. Harenberg, for instance, wrote a Latin work under the name of J. C. Trichorius, the etymological equivalent of Harenberg), nor how often the bibliographers differ, so that very frequently it is not enough to find your man recorded in a dictionary, you must further investigate the accuracy of your authority. Mr. Abbot's book, in this respect, we should look upon as final. As an authority in this department of literature, it ought to be in the hands of every librarian.

With regard to another feature of this catalogue, a fidelity in the smallest details which summons to its assistance the skill of the printer, we would instance a contrivance which, so far as our knowledge goes, is original with this catalogue. We refer to the way in which omissions in the transcription of titles are indicated. One who has given some attention to the matter wonders why among printers, or with one printer in the treatment of the same book, no uniformity has ever obtained in the way of showing omissions. Here and there a mass of stars or points, without regard to number and with no distinction of the marks of punctuation from points that indicate omissions, does the work. It is rare to find uniformity in a book. Mr. Abbot shows an omission in the middle of a sentence by three small dots in close sequence; if the latter part of a sentence is left out, the three dots close together precede the period by an interval double that between the points; if a sentence before the imprint is left out, the three dots separated by a like interval from the period follow the period. If something at the beginning of the title is gone, the dots precede the title after the author's name. It is to our mind a contrivance as simple as it is neat, desirable, and beautiful. It could hardly be simpler, and the only defect in the arrangement, so far as we can see, is that the three dots coming after a period do not tell you whether one sentence or more is omitted, nor, preceding the final period of a title, do they tell you whether some words or one or more sentences have been left out. They do, however, always indicate an omission.

The catalogue is a classed catalogue, and the books are arranged under three general heads: "Nature of the Soul," "Origin of the Soul," "Destiny of the Soul." Under the last head, which contains the greater part of the titles, are three sections: "Comprehensive works on the Immortality of the Soul—the Future Life"; "Doctrine concerning the Soul and the Future Life among Nations and Sects not Christian"; "Doctrine concerning the Soul and the Future Life in Christian Theology." The contents of the last two sections are again arranged in numerous subdivisions, and an appendix collects titles under the two heads: "Modern Spiritualism, or Spiritism, Ghosts, etc."; "Nature, Origin, and Destiny of the Souls of Brutes." At the end an index gives the titles of anonymous works and the names of authors arranged alphabetically, and a second index groups under numerous subject-headings the works treating of the topics covered by those headings.

The titles are arranged under each head chronologically, so that in consulting the different divisions one is able to trace the history of the development of different branches of the subject. A good deal of curious speculation is displayed in these titles. One rubric, for instance, presents us with the authorities in which we may study the speculations of Eastern nations on the doctrine of the transmigration of the soul, and in another we may learn the authority for holding the salvability of Cicero, or Aristotle, or Trajan, or the heathen in general, or Thomas à Becket.

Notes under a very great number of titles give information about authors, editions and translations of the works mentioned, and criticisms, always from eminent authorities. We recommend to librarians especially to consult the titles under Section II. of Class III.: "Doctrine concerning the Soul and the Future Life among Nations and Sects not Christian," if they would estimate the difficulties that have been met and mastered in the preparation of this bibliograph; and to the general reader a perusal of the notes if he would see a fine example of scholarship. The Rev. Dr. Hodge of Princeton, whose 'Systematic Theology,' in the third volume, where he treats of 'Eschatology,' is the most considerable of the later publications which form the subject-matter of this catalogue, calls it "a marvel of ability and learning." Every one must agree with this judgment.

We would only say further, as of interest in the history of classed catalogues making literature accessible, and of bibliographical notes, that Mr. Abbott's preface is dated January 1, 1862, and that his book was commenced more than three years previously. Further, that the work was executed as a by-work in Mr. Abbot's leisure, the latter part of the catalogue having been printed in 1861, when the new and great catalogue of Harvard College Library had been commenced under his direction. It is unfortunate for purposes of comparison with the Boston catalogues and others that this Harvard College Catalogue has not been printed. One should speak guardedly of the relative rank of American catalogues and cataloguers and bibliographers, however, and of the "merely perfunctory discharge of library duty," who has made no attempt to appreciate the value of the work that has been done upon the Cambridge Catalogue, and of Mr. Abbot's labors and his rank among cataloguers and bibliographers.

The Sacred Anthology. A Book of Ethnical Scriptures, collected and edited by Moncure Daniel Conway. (New York: Henry Holt & Co. 1874.)—Thanks are due Mr. Conway for the admirable book which he has compiled. It may be described as a mass of well-arranged excerpts from the bibles of all nations and from some other writings as well. These quotations relate to the whole of human character and duty, and embody much of the deepest and best-tried wisdom. A better book as a companion it would be hard to find. It is easy to give an idea of it: The selected passages are arranged under twenty heads, such as "Laws," "Religion," "Love and Friendship," "Character," "Nature," "Justice and Government," "Charity." They are of course selected from a wide range of authors, the authors of the Hebrew and Christian Scriptures being more frequently cited than any others, and their truth, poetry, and wisdom shining bright beside the wise sayings of the other teachers, though from the others also one may renew and increase his respect for the heart of man, capable of originating or at the least of perceiving and accepting doctrines such as are here taught. Acting upon them is another matter; and we have thought that the portability, so to speak, of all these fine sentiments might have an enervating effect, and that the book might thus prove a spiritual pitfall for some readers. But it is reasonable to dismiss this fear and trust to Wisdom to be justified of her children. Of the character of the subject-matter we may best give an idea by some miscellaneous quotations. This upon "conscience" is from the too much neglected Apocrypha, and we choose it from among so many hundreds of passages, every one worthy of quotation, partly because of its undeserved newness to some of our readers, and partly for the poorer reason that it has been drawn upon for one of his poems by Tennyson—a gleaner in many fields, and one, too, who does not always keep his hand from the sheaf. The lord of the field may think it no more than right, but it will always have an ill look. Mr. Conway gives the passage the heading "Conscience."

"*Conscience.*

"When unrighteous men thought to oppress the holy nation, they lay in their own houses prisoners of darkness, fettered with the bonds of a long night, exiled from the eternal providence. No power of the fire might give them light, neither could the bright beams of the stars lighten that horrible night.

"For wickedness, condemned by her own witness, is very timorous, and being pressed with conscience, always forecasteth grievous things. For fear

is nothing else but a betraying of the succors which reason offereth. They sleeping the same sleep that night—which was indeed intolerable, coming upon them from the bottom of inevitable hell—were partly troubled with monstrous apparitions, and partly fainted, their heart failing them; for a sudden fear, and not looked for, came upon them. Whoever then fell down was fast shut in a prison that had no iron bars. They were all bound with one chain of darkness. Whether it were a whistling wind, or melodies of birds among the spreading branches, or a pleasing sound of falling water, or a terrible sound of stones cast down, or of leaping invisible beasts, or roaring of wild beasts, or a rebounding echo from the hollow mountains: these things made them swoon for fear. The whole world shined with clear light, and none were hindered in their labor: over them only was spread a heavy night. Yet were they unto themselves more grievous than the darkness."

In Tennyson's "Palace of Art" we have the terrible wild beasts, the stones thrown down, and the doubt and great perplexity, of the poet of the Apocrypha. Shelley's "Desire of the Moth for the Star" may also be found in its Oriental original in one of these passages.

Of another strain is this, from the Hindu:

"*Servants.*

"The duty of a servant is extremely hard, and not performable even by saints. If he be silent, he is called a fool; if eloquent, a prattler; at hand, an artful fellow; at a distance, a bad attendant; if patient, a coward; if he endure not, a rascal. What sort of master is that who does not honor his servants while they discharge their duty? To secure service or the discharge of duty there is no need of dragging by violence. He is truly wise who knows the word or deed suited to the occasion. By taking up the whole time of a servant, by increasing expectation, by denying reward, the ill-disposed master is recognized. Favorable discourse to a servant; presents that denote affection; even in blaming faults, taking notice of virtues; these are the manners of a kind master. He who knows how to consider his servants abounds with good ones."

From the Scandinavian the following is selected:

"*Hospitality.*

"Liberal and brave men live best; they seldom cherish sorrow: but a base-minded man dreads everything; the niggardly are uneasy even under benefits.

"Givers hail! a guest has come in. Where shall he sit? Fire is needful to him who has entered: he is cold. Food and raiment are required: he has wandered over the fell. Water he needs, who craves refreshment; a towel; hospitable invitation, a good reception. If he can obtain it, discourse and answer, and wit.

"Never with insult or derision treat thou a guest or wayfarer: men often little know who sits within.

"For the hated oft is spared what for the dear was destined."

And under the same heading the Hindu Hitopadesa says: "Who is a foreigner to those who speak civilly?" The following story is from the Arabic:

"*Mercifulness.*

"The prophet was sleeping alone at the foot of a tree, at a distance from his camp, when he was awakened by a noise, and beheld Durther, a hostile warrior, standing over him with a drawn sword. 'Mohammed,' cried he, 'who is there now to save thee?' 'God!' replied the prophet. Struck with awe, Durther let fall his sword, which was instantly seized upon by Mohammed. Brandishing the weapon, he exclaimed in turn, 'Who is there now to save thee, Durther?' 'Alas! no one!' replied the soldier. 'Then learn from me to be merciful.' So saying, Mohammed returned the sword. And thenceforth these two were friends."

But we might quote the whole volume.

Theory of the Glaciers of Savoy. By M. le Chanoine Rendu (Mém. de la Soc. Acad. de Savoie, X. 95, 1841). Translated by Alfred Wills, Q.C., late President of the Alpine Club; to which are added, the original Memoir and Supplementary Articles by P. G. Tait, M.A., Professor of Natural Philosophy in the University of Edinburgh, and John Ruskin, D.C.L., Professor of Fine Arts in the University of Oxford. Edited with introductory remarks by George Forbes, B.A., Professor of Natural Philosophy in the Andersonian University, Glasgow. (London and New York: Macmillan & Co. 1874. 8vo, pp. 216.)—The publication of an English translation of Rendu's essay on the glaciers of Savoy is made the occasion for continuing an old controversy in very opprobrious terms. It will be remembered that some two years ago an attempt was made by the biographers of James D. Forbes to show that the more important results of glacial investigation are due to him. In a notice upon the life of Forbes, printed in the *Nation* of May 29, 1873, exception was taken to this extraordinary claim and to the slurs thrown by its authors upon Agassiz and other glacial investigators, especially upon Tyndall, who has become, for various reasons, the especial object of their wrath. To the reiteration of these charges in the present volume we would call attention; and since Dr. Tyndall is amply able to defend his own cause, and indeed has done so in a late number of the *Contemporary Review*, we shall dwell chiefly on those referring to Agassiz. As the book has a double purpose, we shall, for convenience, treat it in parts rather than as a whole.

First in order comes a preface by Mr. George Forbes. In this we find but one or two points to answer, others having been noticed in the article alluded to above. Mr. Forbes states (page 8) that the measurements of the Aar glacier were made at Principal Forbes's suggestion. This is incorrect. Agassiz's first measurements were made in 1840, before Forbes was heard of in connection with glaciers. The first measurements made by the latter were taken in 1842. There is another error, or rather a mistaken inference, in Mr. Forbes's introductory remarks. In a note (page 9) he says, speaking of the difference between Forbes and Agassiz: "Professor Tyndall would have done well to leave it in that oblivion to which Mr. Agassiz consigned it for thirty years, and from which it must have pained him to see it resuscitated by a third party." When Agassiz was first startled by hearing that Forbes had taken what he felt to be an unfair advantage, he addressed him a letter of remonstrance, which was printed and circulated among his personal friends and scientific colleagues. From that time, during thirty years, he never under any provocation alluded to the subject again, except in private conversation. It is a curious fact that by Forbes's biographers his own silence on this matter, however frequently broken, is always attributed to magnanimity, that of Agassiz to inability to defend himself. To the latter it was certainly a great pleasure, after his long forbearance, to find that an Englishman was willing to do him justice, and Dr. Tyndall had his full permission to use their frank correspondence as he thought best.

Upon Mr. Forbes's preface follows the translation of Rendu's 'Glaciers of Savoy.' Next in order come various appendices, two of which will no doubt attract general attention. The first is by Professor Tait, on the glacial controversy, entitled "Forbes and Dr. Tyndall." After reading it we can hardly wonder that the *Contemporary Review* refused (as a note states) to accept a communication chiefly remarkable for its personalities. In behalf of science in general, we may say that this portion of the book will have its strongest influence with those who believe that abuse can add weight to criticism. It deals chiefly with Dr. Tyndall's share in the discussion, dismissing Agassiz and his claims by referring us, as far as they are concerned, to Mr. Ruskin, who next takes up the theme. Mr. Tait congratulates himself on the accession of this ally. It may win him miscellaneous readers, but among scientific men Mr. Ruskin's clever use of language will hardly atone for his arrogance and ignorance of the special subject, nor can the noted grace and dexterity of his style disguise his coarse unscrupulousness. He concludes by saying that he has "striven always to be kind to the living—just to the dead." In this instance, a tinge of good breeding towards both would have been more to the purpose. It is unworthy of a man who assumes, as Tait does, to be umpire in a scientific discussion, to call in aid a popular writer who may dazzle and confound the public, but who has, as he ought to know, no voice among scientific men. On this ground, Mr. Ruskin's contribution might be dismissed without comment but that certain of his remarks give occasion for restating an important distinction, bearing upon the whole subject of glacial research. Considering as settled Forbes's claim to priority in discovering the viscosity of glaciers and the so-called dirt bands, points which he further tells us have "solved the problem of glacier movement for ever," Mr. Ruskin continues, "Fancy the feelings of poor Agassiz in his 'Hôtel des Neufchâtelois.' To have had the thing under his nose for years and missed it." The elegance of the phrase is perfectly in harmony with the rest of the article; but we may remind those who read it that whether Forbes's explanation of the nature of glacier motion be the true one or not, Agassiz was studying the special process immediately before him with reference to a larger problem. He was seeking the evidence of a great phase in the world's physical history, cosmic in character and extent, the clue to which he found in the local action of present glaciers, and which he traced in after-years over a great part of three continents. To this end, he established his station on the glacier of the Aar; to this end, after four summers spent in tracing the ancient extension of ice in Switzerland, he went to Great Britain with the avowed purpose of looking for glacial tracks there, an excursion the successful result of which was announced in the same year to the Geological Society of London; to this end, feeling the importance of associating a physicist in a work which he and his companions could only pursue as geologists, he invited Principal Forbes to his cabin on the glacier. Forbes came and remained for some weeks, during which he maintained a guarded silence upon the most important points connected with the physical phenomena of glaciers. This was no doubt a disappointment to Agassiz, and he was still more wounded at the explanation given by subsequent events to Forbes's reserve. But here his disappointment ended; for, to adopt Mr. Ruskin's illustration, "the nugget" with which his guest "walked off," even supposing it to be pure gold, was but a fragment from the mine he was working. Mr. Ruskin further characterizes the glacial researches of Agassiz as "scientific mischance" and "scientific dulness." To this we can only answer, that whenever the glacial epoch in its more comprehensive

sense is proved to be a mistake, then and not till then it may be said that Agassiz's glacial work was a failure.

The Amateur's Photographic Guide-Book. By W. J. Stillman. (London: C. D. Smith & Co. 1874.)—In this little manual of about a hundred pages Mr. Stillman has brought together the results of his own wide experience in practical photography and of his intercourse with the first English amateurs of the present day, of whom he says that "the work shown by some of them is literally the very best of its kind the world can show." His instructions embrace the use of both dry and wet plates, and the preparation of all the materials required in the working of them. They are unexceptionably full and precise, and each topic receives a separate discussion in an appendix. Appendix E, on field and tropical photography, displays Mr. Stillman's cleverness as an inventor in overcoming the difficulties of this trying branch of the art. Appendix E (*bis*) is on lenses, in which Mr. Dallmeyer is freely quoted from as an authority. In the chapter on the development of the negative in the wet-plate process, Mr. Stillman departs an instant from his purely technical discourse with the reader, and gives vent on page 41 to his artistic feeling in a paragraph which may be worth quoting—none the less because its evident lack of finish proves it to have been quite spontaneous:

"One of the most beautiful and interesting phenomena I know in practical chemistry is the appearance of the image in this white, dull film, which gives no indication of its presence until the iron solution is poured on, when, with the regularity of a sunrise, the image appears, slowly coming up, each part in its order as the light calls on it; to see it growing into intelligibility and then into completeness; finding in it little things overlooked in nature—little indications of order and preference which we had not anticipated—until, on looking back to the subject, we find that we had not half seen it before, so many things have we watched growing under our eyes whose presence in the scene we had not suspected."

Sketches of Illustrious Soldiers. By James Grant Wilson. (New York: G. P. Putnam's Sons. 1874.)—Between the covers of this book are sketched in brief the histories of many men—too many even to enumerate here—who, in the last four centuries, have been famous in good causes and bad for getting other people killed. Gonsalvo of Cordova, "the Great Captain" of the time of Columbus, opens the record, and the hero of Vicksburg and Appomattox closes it. The book is literary rather than military: that is to say, it is not critical, new, or suggestive in military matters, but deals in a pleasant way with events and anecdotes, and is relieved by a good deal of poetry. Taking a few of the author's subjects at random, we cannot say that his sketches would be useful to any one who had read Motley on William of Orange; Carlyle on Frederic the Great; Alison on Marlborough; Schiller on Wallenstein; the despatches of Wellington; Sparks, Bancroft, or Irving, on Washington; Thiers, Jomini, or Scott, on Napoleon. But to excite an ambition to read these works, these sketches might fall on good ground; and, therefore, we think that the school-room, rather than the library, is the true sphere of the book, especially as in the brevity of its chapters it has a quality which the school-room can best appreciate. We lately overheard a conversation between two little girls in a horse-car on the subject of American history, and after a long discussion of its difficulties, and how hard it was to remember all about the Revolution and the heroes of that time, one said to the other with a sigh: "Well. I like General Montgomery best; he didn't do hardly anything."

While we have nothing to say against the interest of such a series of sketches, we can only regret that in this country a taste for writing military history should not, for the present, confine itself to the truthful and critical illustration of recent warlike events at home. For here, though the harvest of military history is ripe, skilled laborers thus far are few.

History of the American Ambulance established in Paris during the Siege of 1870–71. By Thomas W. Evans, M.D. (London: Printed for the Author; New York: Wm. Wood & Co.)—Dr. Evans's share in this showy volume is confined to the introduction, in which he describes what the Americans in Paris planned for the relief of the wounded during the siege of 1870–1871. A "relief society" was organized at his house in July, 1870, Dr. Evans the chairman. Contributions were solicited from Americans in Paris, and from the ex-members of the Sanitary Committee of our late civil war. About 50,000 francs were given by the former class, and with these funds, and others contributed by Dr. Evans, a tent-hospital was erected upon the Avenue de l'Impératrice, and a volunteer medical staff was engaged. Letters were received from American sympathizers containing abundant enthusiasm, but no drafts; they are here printed in full. Meanwhile, the great frontier battles of the Franco-German campaign were fought, and the question came up whether to go to the front or to stay in Paris. The surgeons wanted to get into the field, "curious to experience in their own persons the sensational excitement," as Dr. Evans sardonically remarks, of seeing battles fought. But Dr. Evans was for staying comfortably in the Avenue de l'Impératrice, and his counsels prevailed, to the offence of the surgeons. They resigned in a body, not without bitter partings. Dr. Evans himself left Paris before the tide of war reached it, the Empress having, as he tells us, "entrusted her personal safety to him." He did not return until the siege was raised and the hospital work was done. That work, with many other things more or less remotely connected with it, is detailed at great length in the reports of Drs. E. A. Crane, W. E. Johnston, and J. Swinburne, the members of a staff engaged and, we believe, salaried by Dr. Evans. These reports make up more than six-sevenths of this bulky book, Dr. Swinburne's essay upon the surgical cases being the best. The whole number of cases treated in this field-hospital (which, by the way, Dr. Evans persists in calling an ambulance, using that word in the French sense) was but 271. Three-fourths of the book is padding. It is sumptuously printed, at great expense, and is evidently intended for courts rather than for camps. It is, indeed, one of those books which are not only not books, but which were never exactly intended to be books. Thus the curious reader will not find the names of Drs. Crane, Johnston, and Swinburne, its chief authors, upon the title-page; they must be sought for in the body of the work. The 'History of the American Ambulance' will not greatly advance our knowledge of history or of surgery, but it will be just the thing for a gift-book to princes and to other persons whose cares will not permit their looking further into it than the title-page.

BOOKS OF THE WEEK.

Authors.—Titles.	*Publishers.—Prices.*	
Aitken (Mary C.), Scottish Song	(Macmillan & Co.)	$1 25
Acrelius (Rev. I.), History of New Sweden	(J. B. Lippincott & Co.)	
Blackie (Prof. J. S.), Horæ Hellenicæ	(Macmillan & Co.)	4 00

THE LEISURE HOUR SERIES.

16mo, cloth, price $1 25 per volume.

Just Published,

ALCESTIS. A New Musical Novel.

16mo, $1 25.

"We take leave of this pretty, graceful, and original book with a regret such as we rarely feel in laying down a novel—that there had not been another volume to it. . . . The story is full, in all its details, of a modest freshness and refinement, which the reader will find very delightful amid the many hot and hasty productions of this novel-writing age."—*London Spectator.*

"The author is evidently a musician, and the book is a genuine offspring of musical and artistic enthusiasm. . . . It is held together by a consistent and well-ordered plot. . . . Those who look beyond mere amusement, and estimate work by its artistic merit, will find in it, we think, evidence of unusual power."—*London Saturday Review.*

"Beyond most fictions of the season, has the essential charm of novelty."—*London Athenæum.*

"Not merely an exceptionally charming story, but a work of art."—*London Examiner.*

HENRY HOLT & CO., New York.

HARPER'S CATALOGUE. The attention of those designing to form libraries, or increase their Literary Collections, is respectfully invited to Harper's Catalogue, which comprises a large proportion of the standard and most esteemed works in English Literature—*comprehending over three thousand volumes.*

Librarians, who may not have access to a trustworthy guide in forming the true estimate of literary productions, will find this Catalogue especially valuable for reference.

The Catalogue is arranged alphabetically by the authors' names, anonymous works by their titles. The index is arranged by the titles of the books, besides having numerous appropriate heads, each general head being followed by the titles of all works on that subject.

Harper's Catalogue sent by mail on receipt of ten cents.

Address HARPER & BROTHERS,
Franklin Square, New York.

ANTIQUE AND ARTISTIC FURNITURE, ETC.,

Combining beauty of design, good workmanship, and most reasonable prices, is now to be had at the rooms of the HOUSEHOLD ART CO., 158 Tremont St., Boston.

☞ Travellers are invited to examine the work.

THE WEEK IN TRADE AND FINANCE.

NEW YORK, July 7.

DURING the early part of the week there was an increased activity in the money market, and loans were made at 4 and even as high as 5 per cent. The usual calling-in of loans on and about the 1st of July, for the purpose of making provision for the payment of interest and dividends, was the cause of the rise in rates; besides this, the banks have withdrawn some of their legal tenders to send to Washington to make the required deposit against their circulation. Later in the week money became easier, and in the anxiety of lenders to place their money so as to obtain interest over Saturday and Sunday, loans were made at 2½ to 3 per cent., from which there has been no change up to this time. There is a firmer feeling in the market for commercial paper, and the rates have stiffened ½ to 1 per cent. Prime names are now quoted 6 to 7 per cent.

The bank statement on Friday was favorable, showing an increase over last week of $828,225 in the surplus reserve. The following shows the changes in the different items:

	June 27.	July 3.		Differences.
Loans	$281,791,500	$287,422,200	Inc..	$5 630,700
Specie	19,714.300	21,934,300	Inc...	2,220,000
Legal tenders	62.923,200	63,660,500	Inc...	737,300
Deposits	232.929,200	241,445,500	Inc...	8,516,400
Circulation	26,511,300	25.863,900	Dec...	647,400

The following shows the relation between the total reserve and the total liabilities:

	June 27.	July 3.		Differences.
Specie	$19,714,300	$21,934,300	Inc..	$2,220,000
Legal tenders	62,923,200	63,660,500	Inc...	737,300
Total reserve	$82,637,500	$85,494,800	Inc..	$2,957,300
Reserve required against deposits	58,232.300	60.361.375		
Excess of reserve above legal requirem'ts,	24,405,200	25,233 425	Inc...	828,225

The stock market has been active most of the week, and the fluctuations at times were quite important. The market closed on Friday at very nearly the highest point of the week, and a firmer feeling was felt among operators. This morning the decision of the U. S. Circuit Court in Wisconsin in refusing the application of the Chicago and Northwestern Railroad Company for an injunction restraining the State from enforcing the recent laws in regard to railroads, had a very depressing effect upon the whole list of speculative stocks, but especially upon those of the Chicago, Milwaukee and St. Paul, and the Chicago and Northwestern Railroads; during the rush to sell which ensued upon the opening of the Stock Exchange, St. Paul sold down to 36½ and Northwestern to 40¾. The decline in other stocks was considerable, but not so severe as that in the stock of the two roads named.

The following shows the highest and lowest sales of the leading stocks at the Stock Exchange for the week ending Friday, July 3, 1874:

	Monday.	Tuesday.	Wed'day.	Thursday	Friday.	Saturday	Sales.
N. Y. C. & H. R...	100¾ 101	99¾ 100¼	99¾ 100¼	99⅝ 99¾	99⅞ 100		10,200

Legal Holiday.

The feature in the Government bond market was the circular of Secretary Bristow inviting proposals for the whole or any part of the remaining unsold 5 per cent. bonds of 1881, amounting to $179,000. The circular was a complete surprise to the Street, and bankers have disagreed as to the real intention of the Secretary in issuing it at this time; some thinking that it was for the purpose of "sounding" the market and seeing what he *can* do, while others believe that an offer has been already submitted to him for a large amount, coupled with the option of taking the balance at any time within a certain period at the same price—a sort of "call," we presume. The opening of the proposals on the 23d inst. will be looked forward to with great interest. We think that the Secretary would hardly have taken so bold a step without having previously received encouragement to do so from others who are perhaps capable of judging what is best in the matter.

Prices during the week have undergone no important changes; the market has been dull, with a moderate demand for investment. The following are the closing quotations this evening:

U. S. 6's of 1881 ..... 116¾@117	U. S. 5-20, 1867 ..... 116¾@117
U. S. 5-20, 1862 ..... 113¾@113¾	U. S. 5-20, 1868 ..... 116½@117
U. S. 5-20, 1864 ..... 116¾@116¾	U. S. 5's, 10-40 ..... 113 @113¼
U. S. 5-20, 1865, May and Nov.. 116½@117⅛	U. S. 5's of 1881 ..... 113 @113¼
U. S. 5-20, 1865, Jan. and July. 115¾@116¼	U. S. Currency 6's ..... 116 @116¼

The gold market has been very dull, with a declining tendency in prices. The following table shows the course of quotations each day of the past week:

	Opening.	*Lowest.*	*Highest.*	*Closing.*
Saturday, June 27	111¼	111¼	111¼	111¼
Monday, June 29	111	111	111	111
Tuesday, June 30	111⅛	111	111¼	111
Wednesday, July 1	110⅞	110⅞	110⅞	110⅝
Thursday, July 2	110¾	110⅝	110⅝	110⅝
Friday, July 3	110⅝	110¼	110⅜	110⅜

The Treasury programme for July provides for the sale of $5,000,000 gold—$1,000,000 on each Thursday.

The specie exports for the week ending July 4 amount to $534,186.

Publishers, 47 and 49 Greene Street, New York.

CHOICE SUMMER READING,
JUST PUBLISHED BY
ESTES & LAURIAT.

DEEP WATERS. 1 vol. 8vo, paper, 75 cents. By Anna H. Drury, author of 'Misrepresentation,' etc.

What the press says:
"One of the best-sustained fictions of the season."
"A work of more than average ability."

RUMOR. 1 vol. 8vo, paper, 75 cents. Author of 'Counterparts,' etc., etc.

'Rumor' is no common story; it has scenes and sentiments of singular force, individuality, and beauty.

THE LIFE OF CHRIST. By the Rev. Frederick W. Farrar, D.D., F.R.S., Master of Marlborough College. 2 vols. 8vo, $7.

"We do not believe modern criticism has yet given to us a volume containing so many excellences of arrangement, grouping, and detail, such accuracy of statement and such glow of language, such careful and extended research and such singular grace and beauty of style, as that which lies before us in this work of the Master of Marlborough College."—*From a Review by the Rev. Henry C. Potter, D.D.*

E. P. DUTTON & CO., Publishers,
713 Broadway, New York.

FOREIGN BOOKS Reviewed in the *Nation*, and books in all languages, at SCHOENHOF & MOELLER'S,
Importers, 40 Winter Street, Boston.

The Nation.

NEW YORK, THURSDAY, JULY 16, 1874.

The Week.

THE news from the Plains is full of rumors of an Indian rising, and outrages of greater or less gravity are reported all the way from Pembina in the north down to the frontier of Mexico. The army is too small to display much activity over so wide an area, and General Sherman jokes grimly over the Indian policy of the Department of the Interior, which, he says, sends the warriors and ponies fat and sleek in spring to ravage the frontier, and receives them back in the fall like returned prodigals. The testimony of all respectable white men who have lived on the Plains is, however, that the Indians are more sinned against than sinning, and that their risings usually have behind them a solid support of cheating and cruelty. They are swindled by the contractors out of their lawful subsidies, and they are roused into quitting their reservations by the fact that they are constantly being shifted from good land to worse, in compliance with the intrigues of knavish land speculators at the Department of the Interior. Probably nothing could happen at this moment that would seal up such a fountain of white iniquity so well as the death of the last Indian. The cool way in which General Grant has allowed his Indian Commissioners to be driven out of their offices by the Ring knaves, is a striking illustration of the official nonchalance of which we have spoken in another paragraph.

We are apparently at last about to have some light on the affairs of the Erie Railroad. A meeting of the directors was held on Tuesday, at which Mr. Watson, the President, presented, pending the completion of his own report, that of the two auditors appointed to overhaul the books after the withdrawal of Dunan. It appears from their report that Dunan, by omissions and irregularities, made it appear that there was a surplus of over two millions when there was in reality a deficit of over one hundred thousand, and that although the dividend recently declared was really earned during the period assigned for its production, of course there was no money which could, had the truth been known, have been properly used for paying it. Dunan's "revelations" last spring would thus be explained even if they had not been disposed of by the admitted falsehoods of his statements at the Attorney-General's investigation, and there appears to be little doubt that he has confessed himself a knave in the interest of a stock-jobbing operation. What are the prospects of the road, however, it will be difficult to say until Mr. Watson's report appears. The examination made by Captain Tyler and the English accountants who are over here is said to have resulted favorably, or at least to have revealed a more satisfactory state of things than they had expected.

The Cincinnati *Commercial* thinks the New York *Tribune* is incorrect, as well as injudicious, in maintaining that the result of the Wisconsin railroad law, if enforced, will be that the corporations will buy up the legislators, and holds that not only will saying this exasperate the Grangers, but that these latter will have no difficulty in electing legislators who will not be corruptible on this point; that no legislature dare take bribes to act in opposition to the popular wish, when it is clearly expressed and strongly felt and the people knows its own mind. This is doubtless true of great and distinctly defined questions, such as slavery or secession, but it is not true of matters of dollars and cents (or rather of cents), the right or wrong of which no man can tell, and which are never finally settled. The rate which a railroad ought to charge would come up in Wisconsin every year, and there would be one hundred good excuses for changing which the farmer could not understand or weigh, and which might appear insignificant to him. To suppose that the public would keep its mind so steadily fixed on the matter as to prevent bribery is preposterous. Besides, if the companies do not have to pay the politicians for raising the rates, the politicians will certainly before long insist on being paid for not lowering them, and of this the godlike farmer would know nothing.

The *Railroad Gazette* of last week has a useful and instructive article, the reading of which, however, gives one a sensation which is, we imagine, very similar to that which one would experience from passing an evening with a band of communicative brigands in Calabria or Greece. It contains a calculation of the pecuniary gains to Wisconsin of carrying out her railroad law, and starts with the assumption that, as but few railroad proprietors live in Wisconsin, the people will have no hesitation in squeezing all they can out of the corporations, without any regard to the morality of the matter. It shows that there is but little comfort to be derived from the notion that the law does not affect inter-State transportation, because, if it be dearer to send grain to Chicago outside the State than to Milwaukee within it, the grain will go to Milwaukee. It prognosticates as a probable effect of the law, if enforced, the wiping out of the railroad stock, and the reduction of the bondholders' interest to about two per cent. on their bonds, which will then be no more valuable than stock. Then, although the State can do for some years without new roads, it cannot do without new and additional rolling-stock and repairs, which, however, the owners of the roads would never think of providing, knowing them to be subject to confiscation. The result would speedily be that the roads would run down until they were unworkable, and the State would then have to take possession of them, and spend a large amount of money on them, raised by taxation. Indeed, the *Gazette* says that taking possession of the roads at a valuation, and working them by State officials, is "the only course compatible in the long run with the authority of the State to fix rates of transportation in communities like those of the Northwest," where there are no resident capitalists and nobody to say a word for vested interests. The trial of such a system by one State, it thinks, would be of inestimable advantage to the stockholders of roads in other States, for obvious reasons.

The Republican magnates have prepared an address to their party, and it is to be issued in time for effect upon the Congressional elections. It naturally has two main topics—the currency and the transportation question. Perhaps we might better say that it has three main topics—the two we have mentioned and another one which every now and then crops out, namely, the futility of looking to the Democratic party for any real friendship to the country or any real service. It is Short that is the friend, not Codlin, as Mr. Short says in 'The Old Curiosity Shop.' "Whatever may or may not be expedient to be done," says the address, "this much seems certain, only the Republican party can be relied on to do it. The Democratic party has forsworn all such labors." And again: "If you do not mean to retrace your steps, you will select Republicans and not Democrats. If you mean to go forward in the future, you will select Republicans and not Democrats;" not Codlin but Short. Of lesser matters a number are touched upon, some of which are not a little musty. Of these the foreign policy of the Democracy is one, and the Committee assert of this policy that it has hardly a memory at which the citizen will not blush. Witness our bullying Austria (the Martin Koszta case and the Hülseman letter); the spoliation of Mexico; the demolition of Greytown; the truckling to Great Britain in the matter of the Northwestern boundary (Polk and Marcy); and the Northeastern, between Maine and New Brunswick (Tyler and the Webster-Ashburton Treaty).

As to this last, the address seems to bear the car-marks of Mr. Blaine's property: "While by successive concessions we were constantly adding to the area of the Canadas, we stupidly relinquished to their products free access to our markets," etc. etc. The home record of the Democrats is also brought forward, but the printed synopsis of the forthcoming document does not go into particulars.

As regards the currency, the Committee who prepared the address say that it "is in an abnormal condition, and must be reformed," and while they admit that the Republican party is not agreed upon the method of effecting this reform, yet the Democratic party, they urge, is not any more ready: "Neither party, as such, yet sees clearly the right way." Yet two reasons are visible for believing that the Republicans can deal with the question better than their rivals. In the first place, as the former have at one time and another found their way through greater difficulties than this, so they may be supposed more able than the Democrats to dispose of this one. In the second place, the country may feel sure that when Republicans discover the true way they will pursue it, but that the Democrats will do as much there is nobody to go bail. The method adopted with respect to the cheap-transportation controversy is better than might have been expected. A glance is given at the great bulk of our agricultural products and at the need of getting them as cheaply as possible to the sea, and then brief consideration is bestowed on the various expedients for doing this. The first mentioned is the proposal for State regulation of the rates of fare and freight, and it is observed that "the objections to it are so serious that it should not be embraced if a better can be found. . . This country, so new, so raw, needs capital, and any policy which would tend to drive capital from us should be avoided if possible." Yet if on the one hand the people of the State, who are the purchasers of transportation, are eager to buy it as cheap as they can, and even to buy it cheaper than they ought, on the other hand the railroad companies, the sellers of transportation, naturally wish to get as much as possible for their commodity, more perhaps than they ought. What, then, shall be done? The interests of both purchaser and seller are closely intertwined and practically identical, and it may be hoped that a way will be hit upon—but by the Republicans of course, not by the Democrats, who traditionally hate all internal improvements.

The charges against Mayor Havemeyer have been formally presented to Governor Dix, who has sent him notice of them and called on him to answer. Since then the old gentleman has been pestered by reporters wanting to know what he is going to do, and he meets their attacks with his usual gaiety, pretending not to be troubled and pleading ignorance of nearly everything unpleasant in his position. People think, he says, that the charges against him are "a big thing"; "but a balloon is a big thing, and yet the prick of a pin will let the gas out of it," and then he chuckles over his own joke. His excuse for reappointing Charlick and Gardner is that the families of these men are disgraced by their conviction, and he owes it to their children to rehabilitate them, which is also a good joke; but it shows that Havemeyer with all his folly is a man of his time. In fact, he furnishes a very interesting illustration of the way in which what we may call the Tweed "style" has taken possession of men in politics in all parts of the country. A jaunty, indifferent air, in the practice of which Tweed was a great master, a tone of contempt for newspaper and other criticism, an affected ignorance of the commoner subjects of popular excitement and indignation, and an ostentatious devotion to all colleagues and subordinates, under all circumstances and in defiance of all charges, as "comrades" or "brother officers," and a readiness to meet all pursuit of them by promotion or translation to a fresh place, are among the characteristics which a large number of men in public life now seem to take a pride in. It is a fashion which will speedily pass away, and strikingly resembles, on a lower plane, the tone Palmerston for a few years introduced into public life in England. That Havemeyer should have caught it so readily in his old age shows how subtle and penetrating such an influence is. Among the chief fosterers of it in this country are General Grant, General Butler, Senator Conkling, Boss Tweed of course, and Boss Shepherd, and they have a host of smaller followers. One of the most amusing recent exhibitions of it was Senator Howe's affected ignorance, towards the close of the moiety investigation in the Senate, of anything wrong with Jayne. He did not know what all this fuss was about; all he could learn of Jayne was that he had collected so much money for the Government, etc., etc.

Mr. Henry Ward Beecher's determination, which he seems to have reached immediately upon the appearance of the Tilton letter, to have the matter investigated by a committee of his own church, has given a good deal of relief to multitudes who are deeply interested in having his good name preserved, if for no other reason, because they believe that the fair fame of such a man as he cannot be destroyed without serious injury to things of more importance than any man's fame. The investigation is, at this writing, in progress, and the committee give the public to understand that it is thorough, and that the doors are open to all Mr. Beecher's accusers. We mean to cast no imputation on the committee when we say that the result, if favorable to Mr. Beecher, would be more satisfactory if some of the members did not belong to Plymouth Church, and if they had not all been selected by himself. The community as well as the church is interested in the matter, and ought to be represented. This would be true even if there was not in every church a good deal of ordinary mundane *esprit de corps*, which is not a judicial quality.

The white men of New Orleans have recently held a political meeting, which was so well attended that newspapers friendly to the cause asserted it to have been a very large gathering. Considering the fact that Louisianians have of late seen fit to make more than one formal appeal to their fellow-citizens at the North for protection, sympathy, and support, we doubtless are free to say that the white people of New Orleans are yet in some ignorance as to the condition of Northern opinion, and that they had better let the Democracy carry a few more important States before they placard such sentiments as make up the manifesto of the Crescent City White League. Much that is said is well said; but to tell the truth, the document cannot be read without feeling as if its authors were impatient young White Leaguers, with their fingers on the triggers of their pistols, and all ready, if not more than ready, for another 1866 riot of vastly larger proportions. They declare that once there was a time when they thought the negro could be induced by persuasion to see that his interests were identical with those of his white fellow-citizens, but it is long since they have been forced to discard that vision. Everywhere around them they see "the most absurd inversions of race." Negroes are not only incessant in demanding offices for which they have no qualification except the color of their skin, but in their conventions they develop a spirit of proscription against all white men including Republican ex-soldiers; the negro arrogance knows no bounds; and "the hereditary civilization of Louisiana is threatened and menaced by a stupid Africanization," for nothing less is intended than to drive every white man out of the State, and to make of it a second Hayti. Under these circumstances, "it is worse than idle to reason with these people," and what the address proposes, almost in so many words, is a league of white men pledged to fight, if need be, for their liberties against negro insolence and despotism, and apparently expecting that the fight may begin at no distant day.

While all this appears to be, as political action, extremely ill-judged, and certainly will meet with commendation from few or no people at the North, and especially from no persons of political influence, we may properly bear in mind that it is frank, whereas it need not have been; and that the provocation has been tremendous.

Here, for instance, is how Gov. Kellogg collects the taxes, the collection of which is the proof of how fond of him the Louisianians are:

"That of the taxpayers who are now or shall become delinquent by the non-payment of taxes on real estate, as is provided for in this act, and shall have been so returned upon the rolls of the tax collector to the auditor of public accounts, the auditor shall publish in the official journal of the parish in which such delinquent resides, or by public notice when there is no official journal, by three insertions within ten days, the name, residence of, and amount due from such delinquent taxpayer; and such delinquent taxpayer shall, after thirty days, *forfeit his right to bring suit or be a witness for or in his own behalf before any justice, parish, district, or State court; and every court having jurisdiction within the State shall deny and refuse to issue a civil process of any kind or nature whatever in his own name or for his own benefit*, until he shall, if a resident of the parish of New Orleans, have procured from the auditor of public accounts, or, if a resident of a country parish, from the tax collector thereof, a certificate setting forth that all such claims for delinquent taxes and costs thereon against said delinquent taxpayer have been paid."

In other words, if McEnery does not pay his taxes to Kellogg, he is made an outlaw.

The announcement that he is going home to Ireland will be the first news to the greater part of the public that Mr. John Mitchel, one of the Irish agitators of 1848 and the years just preceding, and afterwards a resident of this country, has still been living here. When he first came over in 1854, the ardor of the Slievegammon days and the Slievegammon Funds had somewhat abated, but there yet remained a welcome for men like Mitchel not only from his countrymen, but also from many Americans. It is not now quite as it was then; witness the experience of Rochefort and Bradlaugh; but at that time it was inconceivable that any rebel (so he was white) against any government anywhere in the world, should not be received with effusion at first, and afterwards, if he behaved himself, or if he misbehaved himself with judgment, assisted to get on his legs again and succeed. Mr. Mitchel, however, was an inconsiderate man, of a senseless violence of thought and speech, of an overbearing, arrogant disposition, and with an opinion of himself and his importance which he was very soon almost alone in entertaining. He set on foot here in New York a paper called the *Citizen*, but he made little or nothing of it, and by-and-by, with his usual skill in discovering the main streams of public life and thought, he became a characteristically bitter and headlong advocate of pro-slavery doctrines. Many of his American friends who would have hailed a victory, or a hatful of them, at Slievegammon, and would have liked to see the Republic of Ireland proclaimed, with Meagher of the Sword at the head of the army for the invasion of England, he disgusted by his well-chosen declaration that he would be very glad of an Alabama plantation stocked with good fat niggers. Nor was his warmth of zeal especially pleasing to the Southerners, among whom he desired to cast his lot. In short, he was a new-comer, unfitted for anything but dabbling in politics, and very ill fitted for that except as an unbridled tongue could fit him, who made himself injudiciously busy, and whose behavior was suspected to discover as little sincerity as modesty or good sense. During the war he was a secessionist, and we dimly remember that at or towards the end of it he contrived to make a disturbance by getting a newspaper, of which he was the slashing editor, into difficulties with the Government. He now goes back to Ireland with the avowed intention of trying to get into Parliament as a Home Ruler. We believe he goes back with an unfulfilled sentence still hanging over him, but his hopes of martyrdom are probably slender. He is an unfavorable specimen of a poor breed from whom Ireland has probably suffered more than she will suffer again, but whose existence is not the less to be regretted.

On Wednesday week there would have been another "ministerial crisis" at Versailles if it were not for the determination of Marshal MacMahon, to which we have already referred, to govern in the Prussian and not in the English way—that is, to consider the ministry responsible to him and not to the Assembly. Accordingly, after a motion of the Legitimist, M. Lucien Brun, regretting the suspension of the *Union* by the Government had been negatived, another by M. Paris, of the Right Centre, declaring that the Assembly upheld the Septennial powers of the President of the Republic, and, reserving the other questions submitted to the Constitutional Committee, passed to the order of the day, was put and lost by 368 to 331, whereupon the ministry tendered their resignations, and Marshal MacMahon refused to receive them. The Marshal, who is evidently getting rather tired of the performances of the Assembly, on the following day sent it a message, in which he declared that the Assembly, in giving him the executive power for seven years, "imposed duties on him for which he was accountable to France, and from which he could in no case be permitted to withdraw," and that these powers were irrevocable. He then said that it must go on and complete its work, that the Assembly could not meditate tearing up its engagements, and that the country demanded "the organization of the public powers" and "the settlement of reserved questions." An attempt was then made to dissolve the Assembly as incompetent to perform the work demanded by the Marshal, but it failed, and the motion was referred to the Committee on Parliamentary Initiative, in which there is a Radical majority.

On Friday, M. Fourtou, Minister of the Interior, appeared before the Committee of Thirty, which is charged with the drafting of constitutional bills, and explained in detail the Marshal's views as to what "the organization of the Septennat" meant. He is prepared to accept the plan of a Second Chamber, in which he should have the power of nominating a large proportion of the members; but insists that members of the Assembly should be elected by districts, and not on a general ticket as now, and that he should have the power of dissolving the Lower Chamber. There appears to be no serious opposition to all this, except among the Legitimists, who are very downcast—probably over the revelation recently made by the London *Times's* correspondent (apparently on information received from the Duc de Broglie), that the restoration last year was frustrated by the mulish obstinacy of the Count de Chambord with regard to the white flag, the appearance of which as a substitute for the tricolor Marshal MacMahon declared would "cause the chassepots to go off of themselves."

There is little news from Spain, but what there is is favorable to the Carlists, who gain rather than lose ground. There are no fresh signs of a definitive organization of the Government. The present one is in the meantime meeting the financial difficulties of the situation, which are of course very great, by subjecting the national creditors to another swindling process. The Spanish bondholders have for nearly thirty years been objects of pity on the Exchanges of London and Amsterdam; they now seem likely to become objects of contempt as well. Our readers may remember the compromise with them which was entered into over a year ago, and which was explained at the time in the *Nation*, and which, passing over details, may be best described as the process known among defaulting railroads in this country as "funding your coupons." The Government creditors were in short asked to fund their overdue coupons in a five per cent. bond, secured by a deposit of certain mine and national land certificates. The bonds issued were for much less than the amount due, and under the most favorable circumstances the creditors would have lost heavily. But it now turns out that even this poor compromise will not be executed. The promised security for the bonds has not been put up, and the creditors will receive nothing. In the meantime, the return of Serrano to Madrid has been taken by the British Government as a sign that the Government is sufficiently strong to bear a peremptory application for redress for the shooting of the British subjects found among the crew of the *Virginius*. This was made by the Liberal Ministry, and Lord Derby is now pressing it. The difficulty of "the Republic" in meeting it will be considerably aggravated by the fact that the officer who committed the butchery at Santiago has since been promoted.

THE GRANGER METHOD OF REFORM.

THERE is no doubt that there was to be found in railroad management plenty of reason for great dissatisfaction on the part of the public before the Granger movement had ever been heard of. Rings among the managers of the roads, for the purpose of defrauding the company by making contracts with it, or furnishing it supplies above the market rates, had become shamefully common. So had the practice of stockjobbing on the part of directors. So bad dishonest secresy, and equivocation in the transaction of its business; but from all these things it was the shareholders who suffered. The things of which the public had to complain were the corrupting influence of corporations on the State legislatures; the corrupt discriminations made in freight charges in favor of particular persons, with whom the officers of the roads had a secret understanding; the occasional raising of charges in the absence of competition, and occasional failures to lower them as much as the abundance of business would have warranted; a general want of civility and of a spirit of accommodation on the part of railroad officials. But of all these causes of dissatisfaction, the charges for freight and passengers were the most trifling. Few, if any, roads charged exorbitantly or even unreasonably. The mass of railroads did not indeed charge enough to pay ordinary interest on their cost, and that none were really extortionate was shown by the rapid growth of the country in wealth and population along all the great lines. The first great fuss about railroad charges originated with the seaports on the Atlantic, which were competing for the business of supplying the West with manufactures and exporting its produce. It was and is of the last importance to Boston, New York, and Philadelphia to draw the Western custom to their own wharves and warehouses, and they have therefore all three been for years filling the air with speculations as to the best mode of making transportation cheap for the Western farmers. In the course of these speculations the railroads naturally came in for a good deal of abuse, and it was the earliest abuse which they received, and the fight between these cities was one with which the Western farmer for years never thought of meddling. Indeed, there was no occasion for his meddling, because he had the market to himself for a good while. As long as he stood within reasonable distance of the seaboard, he had no difficulty not only in beating all the Eastern States out of cattle-raising and grain-growing, which he did very speedily, but in beating all competitors out of the European market. Accordingly, it was a matter of perfect indifference to him where his produce was shipped, and he left the New York and Boston and Philadelphia "speculators" to sweat over the problem of cheap carriage.

When, however, the Government began the policy of offering the public lands at low rates to settlers, so as to entice "the pauper laborers of Europe" to this country, and the various States began, with the hearty support of the public, to subsidize and otherwise encourage the construction of railroads running out into the wilderness, so as to force the settlement of these lands, the crisis which we are now witnessing was prepared. This policy was equivalent to the offer of a heavy bounty on agricultural products, and it has forced into the business of farming in the West an enormous and of course undue proportion of the labor of the country. It has done this, too, to the serious injury of our civilization and politics, because the cheapness of land and the facility of transportation have led to the scattering of inhabitants over areas so vast that the educating influence of density of population—one of the most valuable—is lost.

As soon, of course, as corn and other produce began to be raised in greater quantities than could be disposed of in the home markets, and at such distances from the European markets as to be unable to bear the cost of transportation, the cheap-freight problem began to occupy the farmer's mind seriously. For some years, when he had to burn his corn as fuel, the Eastern manufacturers tried to persuade him that all that was needed in the way of remedy was to raise the tariff so as to bring "the toiling millions of Europe" over here to eat his produce, and this, with the feverish demand kept up by the war, pacified him for a while. But as railroads continued to be built, and as settlers continued to push out in the wilderness, and the wilderness to be held up to admiration as the paradise of the young man, and "the hardy pioneer" to be painted as among the noblest of the race, the want of a market became more and more pressing, and the Western farmer more and more sensible that he had somehow got into a false position. And he *had* got into a false position. He had produced too much, in a reckless way, under the influence of applause and encouragement from people who had not weighed their words, and he is now suffering from a glut which nothing but a restriction of cultivation, until population grows up to the level of that now going on, will cure. In other words, farming and colonization have been overdone in the United States. The farmer has shared in the folly of the railroad-builders; but instead of meeting the situation patiently and bravely, he is looking around in the most comic way for somebody to throw the blame upon, or force into saving him from the consequences of his own mistakes. It was said after the panic last fall that we were suffering from the consequences of a railroad debauch; it may be said with equal truth that we are suffering from a land debauch. The poor railroad man is, however, pocketing his losses, and going quietly to work again in the hope of better times; the farmer, on the contrary, seems disposed to occupy himself while he is waiting for a market by robbing on the highway.

The way in which he and his friends are just now trying to conceal from themselves and the public the real nature of the interesting and instructive economic crisis through which the West is passing, has been well illustrated by a paper which Mr. W. C. Flagg, a farmers' champion from Illinois, read before the Social Science Association in this city last May, which that body is going to print among its transactions, and which Mr. Flagg was invited to deliver before the students by the President of Cornell University, at the last commencement, and which he did deliver, if correctly reported, with numerous aggravations. We refer to it because it is the only attempt we know of to make a formal statement of the farmers' wrongs. In it the American farmer—the hardy, independent, and intelligent freeholder of whom the country has been boasting for ninety years, and who really has made it what it is—is treated as the regular successor of the mediæval serf and villein, and as the equivalent and companion in misfortune of the English hinds now striking for higher wages. The American farmer is imitating Wat Tyler, and Jack Cade, and Jacques Bonhomme, we are told, in rising against his feudal masters; and, looking around for these masters and not knowing exactly who they were, he has decided it must be "the railroads and the middlemen," says Mr. Flagg, "and subsequent discussion has shown he was not far wrong." Mr. Flagg goes on to enumerate the "farmers' grievances," the first of which is that while the manufacturing, mining, and industrial wealth of the country has increased eleven per cent. per annum, the agricultural wealth has increased only four per cent. per annum between 1860 and 1870, which he gravely told the young men at Cornell "constituted a most serious charge against the political economy of the country." The second "grievance" is that, while Congress contains only one farmer to every 228,000 farmers in the country, "trade and transportation" furnish one of the class engaged in them to every 26,000 persons; "professional and personal pursuits" furnish one to every 10,800; manufacturing, mechanics, and mining one to 208,000. The result is, he says, that "freights from the West to the seaboard pay or are compelled to pay a heavy tax over and above the necessary cost of transportation." Another grievance is that banking and other moneyed corporations are allowed to make twenty per cent. on their capital, while farming pays only four. We cannot go through the whole list. Since the clubs were closed in Paris in 1871, we have not read a more extraordinary production presented in the guise of a contribution to political economy or "social science."

The attack on the railroads in Wisconsin, without the least re-

gard to the facts or figures of the case, is a legitimate outcome of the agitation which has been going on for the last two years. This agitation received its first stimulus, as we have said, and its only legitimate one, from some of the recent revelations of railroad fraud and mismanagement, beginning with the Erie revelations, and including those of the Crédit Mobilier affair. The second came from the anticipations entertained by the Liberal Republicans, who were disheartened at the result of their campaign, and by a considerable portion of the Republican party who voted for Grant under a sort of compulsion and longed for the formation of a respectable opposition, that the Granger movement would develop into a reform party, and would attack all existing abuses, including, as the free-traders thought, the tariff. We ceased to share these hopes almost from the outset, because it was quite plain from the earliest utterances of the organization that its mind was set on getting its goods carried to market cheaply by *somebody*, and that all it had to say about other concerns was buncombe. Its very earliest act, as we now see, is to add an enormous aggravation to one of the grossest and most dangerous abuses of American politics, and the one which reformers of all shades of opinion have for a long time been trying to uproot, viz., the power of legislatures over corporations. It is well known that there is not a legislature at the North which this power has not in some degree debauched. In this State and in Pennsylvania it had almost destroyed the government, reducing the legislators to the status of mere lacqueys or nominees of speculators. Jay Gould testified that the purchase of legislators was a regular department of his business, and the revelations of Harrisburg were hardly less noisome than those of Albany, and yet all that legislatures have hitherto been asked to do is to grant charters and amendments to charters. In Wisconsin, and in Illinois and Iowa and Minnesota, however, the practice has actually been begun of authorizing the legislature to raise and lower railroad charges, practically without limit, from year to year, thus giving the members a power which will, according to all experience, make them purchasable as cattle; and that railroad managers will deal in them hereafter almost as freely as in stocks, no intelligent man need to be told. The attack on property in which the movement has resulted, is therefore really its least serious feature. Property in such large masses as the railroads has never yet in this country failed to take care of itself in the long run. What we have most to fear from it is a still deeper degradation of politics, by an enormous aggravation of the existing venality, and of the fatal disease of the European democracy, which consists not only in imputing all the evils of one's condition to the government, but in expecting all improvement from it.

WHY PEOPLE LIKE TO LIVE ABROAD.

ABOUT this time there is every year a great deal of discussion of the best mode of spending the summer, and the course of the people who go to Europe, instead of submitting to the discomfort and extortion of American hotels, is for the most part greatly commended. The story told about the hotels and lodging-houses is the same every year. The food is bad, the rooms uncomfortable, and the charges high. This year there is an additional wail over the growing dislike of "country places"; land along the Hudson is declining rather than rising in value; most of the "mansions" and "country seats" are in the market, or ready for it. The fashion, except perhaps at Newport and Beverly, near Boston, and one or two other highly favored localities, grows stronger and stronger, to live in the city in the winter and spend the three hot months in France or England or Switzerland. Moreover, the accounts which come from Europe of the increase in the number of American colonists now to be found in every attractive town of the Continent, are not exactly alarming, but they are sufficient to set people thinking. The number of those who pass long years in Europe, educate their children there, and retain little connection with America beyond drawing their dividends, grows steadily, and as a general rule they are persons whose minds or manners or influence makes their prolonged absence a sensible loss to our civilization. Moreover, when they come back, they find it difficult to stay, and staying is not made easy for them. People here are a little suspicious of them, and are apt to fancy that they have got out of sympathy with American institutions, and have grown too critical for the rough processes by which the work of life in America has in a large degree to be done. They themselves, on the other hand, besides being soured by the coldness of their reception, are apt to be disgusted by the want of finish of all their surroundings, by the difficulty with which the commoner and coarser needs are met in this country, and by the reluctance with which allowance is made by legislation and opinion for the gratification of unusual or unpopular tastes. The result is a breach, which is already wide, and tends to widen, between the class which is hard at work making its fortune and the class which has either made its fortune or has got all it desires, which is the same thing as a fortune. There is a good deal of work which this latter would like to do. There is a great deal of the work of legislation and administration and education for which it is eminently fitted, but in which, nevertheless, it has little or no chance of sharing, owing to the loss of the art of winning the confidence of others, and working with others, which is more easily learnt in America than elsewhere, and which is readily lost by prolonged residence in any European country, and the absence of which here makes all other gifts for practical purposes almost worthless. So that it must be said that the amount of intellectual and æsthetic culture which an American acquires in Europe is somewhat dearly purchased. When he gets home, he is apt to find it a useless possession, as far as the world without is concerned, unless he is lucky enough, as sometimes but not often happens, to drop into some absorbing occupation, or to lose his fortune. Failing this, he begins that melancholy process of vibration between the two continents in which an increasingly large number of persons pass a great part of their lives; their hearts and affections being wholly in neither.

What the remedy for this state of things is it would be hard to say. That it is not to be found in preaching patriotism is quite certain. There is something a little comic in many of the sermons one reads on this subject. People do not love home and country from a sense of duty, or through conviction, any more than they love their mothers, and therefore cannot be argued into it. No people in the world stay at home because they ought. They stay because they like it; and a country which becomes to a man an object of duty rather than an object of affection becomes speedily a bore, of which he is glad to be rid. Probably no remedy will be found soon. A good deal of the summer travel to Europe may be lessened by the improvement of accommodations at home. Country life may and doubtless will become more attractive through the improvement in the roads, the condition of which is what is killing country life in this part of the country. Men who have got used to Park roads in this city will not submit very long to live on the dirt roads which the country road-masters so laboriously repair every year by heaping up muck on them out of the ditches; but it is safe to say we shall witness before many years competition between neighborhoods in the making and repair of roads, as a means of enhancing the value of real estate. Good roads have made the fortune of Switzerland; they are making the fortune of Newport; and they would make the fortune of the Hudson River. A broad, well-kept macadamized route, running up to the Highlands, with occasional branches, and with good sidewalks, would bring back to real-estate owners, we have no doubt, the happy hopeful times of fifteen years ago. The condition of our country roads alone is enough to send any man to Europe in summer who loves either walking or riding. We need a state of things in which a man need not possess horses of matchless speed to prevent people "giving him their dust."

The remedy for the mania for *living* abroad is a more elaborate one, and one needing more time for its creation. No country retains the hearty affection of its educated class which does not feed its imagination. The more we cultivate men, the higher their

ideals grow in all directions, political and social, and they like best the places in which these ideals are most satisfied. The long and varied history of older countries offers their citizens a series of pictures which stimulate patriotism in the highest degree; and it will generally be found that the patriotism and love of home of the cultivated class is in the ratio of the supply of this kind of food. They are languid among the Russians, and among the Germans prior to the late war, as compared to the English and French. In default of a long history, however, historic incidents are apt to lose their power on the imagination through over-use. The jocose view of Washington and of the Pilgrim Fathers, of Bunker Hill and of the Fourth of July, already gains ground rapidly among us, through too great familiarity. When Professor Tyndall, in one of his lectures here, made an allusion which he meant to be solemn and impressive, to Plymouth Rock, its triteness drew a titter from the audience which for a moment confounded him. Unluckily, history cannot be made to order. It is the product of ages. The proper substitute for it, as well as for the spectacular effects of monarchy, in new democratic societies, is perfection. There is no way in which we can here kindle the imaginations of the large body of men and women to whom we are every year giving an increasingly high education so well as by finish in the things we undertake to do. Nothing does so much to produce despondency about the Republic, or alienation from republican institutions, among the young of the present day, as the condition of the civil service, the poor working of the Post-office and the Treasury or the courts, or the helplessness of legislators in dealing with the ordinary every-day problems. The largeness of the country, and the rapidity of its growth, and the comparatively low condition of foreign nations in respect to freedom, which roused people in Fourth-of-July orations forty years ago, have like the historical reminiscences lost their magic, and the material prosperity is now associated in people's minds with so much moral corruption that the mention of it produces in some of the best of us a feeling not far removed from nausea. Nothing will do so much now to rouse the old enthusiasm as the spectacle of the pure working of our administrative machinery, of able and independent judges, a learned and upright bar, a respectable and purified custom-house, an enlightened and efficient Treasury, and a painstaking Post-office. The colleges of the country and the railroads, and indeed everything that depends on private enterprise, are rapidly becoming objects of pride; but a good deal needs to be done by the Government to prevent its being a source of shame.

Correspondence.

MAGNANIMITY.

To the Editor of the Nation:

Sir: In your article on "Universities in Politics," there is put into the mouth of Gen. Bartlett a bit of ethics which needs explanation, viz., "that *all* who shared in it [the war of the rebellion], victors or vanquished, *helped to save the country* and establish its government."

When Israel Putnam killed that noted wolf, did he and the wolf *together* help to save the neighboring sheep and establish their security?

To answer that the rebels were not wolves is not pertinent: First, because the wolf thought his right to eat sheep a good one; the wolf ate or ever man owned. Secondly, because the true and only question is, Whether the wolf, in fighting Putnam, *a fortiori* helped to save the sheep?

It seems to me that we are applying our slipshod good nature, under the name of magnanimity, to the persons lately in rebellion. It is the same spirit that you are wont to call sentimentalism—the spirit that says of every criminal: "Poor fellow! let him out of prison; with his disadvantages, we should have done as he did."

Whether we speak of God's government, or use the phrase of the now numerous all-knowing ones who call it the natural evolution of morals, the fact remains that a crime is never forgotten in that evolution—its vibrations continue always.

Every man who drew sword or shouldered musket to break down the Union committed a crime, greater or less according to his knowledge or his ignorance. I will be second to no one in advocating the full forgiveness of that crime, and in aiding its perpetrators to regain prosperity and happiness; for revenge is base, and has nothing to do with a proper distinction between vice and virtue. To recognize crime, yet forgive and aid the criminal, is magnanimous. To put vice on a level with virtue is to be morally weak.

Others may think as they please; whenever I look on those tablets in Memorial Hall, I shall say: These men died in upholding the right against the wrong. T.

[Our version of the story is this: Putnam and the wolf had been for a great many years sharing the guardianship of the sheep, and on perfectly friendly terms, and holding the flock in common, and under a formal agreement as to the division of duties and profits. They finally differed on various points, and the wolf grew more and more cantankerous and threatening, and finally announced his determination to take his half of the flock and withdraw, which Putnam declined for various reasons to permit, and both parties then agreed to settle it by a fight, but not with deadly weapons, for Putnam declared at the outset that his object was not to kill the wolf, but to bring him to reason, and compel him to continue in the partnership. They accordingly fought, and the wolf got a tremendous cudgelling, and cried for quarter, and agreed not only to go on with the business on the old footing, but never to propose a dissolution of the partnership again, and to perform all the duties and lead the life of a sheep dog. Putnam was very glad to settle the matter on these terms, and always said that inasmuch as he had to live with the wolf, and raise sheep in conjunction with him, and rely on him for a considerable share of the watching, and really at heart respected and esteemed him, he felt that his true policy was to treat him well, and do what he could to soothe and pacify him, and that he must admit that the wolf's straightforward course in fighting it out, and then loyally submitting when he was beaten, was the means of giving a great increase of security to the common property. Being asked, too, whether the wolf had not committed "a crime," and was not therefore unpardonable, he said that as there was no court in which a wolf was triable, he did not see that there was any use in talking about his "criminality." Moreover, he said, there was not much use in debating his conduct as a question of morals; because unhappily a large part of the civilized world thought it at least excusable, and nobody denied that, had he succeeded and got off with the sheep, he would have been considered a very fine fellow. This, we imagine, is the story which our correspondent had in mind, though he has reported it somewhat inaccurately.

As regards the general question of dealing with the South, we hold that anybody who persists in treating and thinking of the persons lately in rebellion "as criminals" is a true sentimentalist; as the object of war against the South was not punishment, in the legal or moral sense of the term. The term punishment, applied to large bodies of men, if it means anything, means vengeance, and vengeance which involves the slaughter of thousands of human beings and the devastations of vast tracts of territory, is an act only worthy of savages. The term, even when used in municipal legislation, does not any longer mean to enlightened persons the infliction of suffering by way of expiation or satisfaction for moral guilt. It denotes simply a means taken by society to protect itself against violence and outrage. Society, as such, knows nothing about moral guilt, because it knows nothing about the state of men's hearts. It only knows that certain precautions are essential to the preservation of life and property, and it takes them. The question of guilt it leaves to the Supreme Ruler. So, also, in the dealings of a nation with a hostile power seeking its destruction. It wages war against it, not in virtue of any divine mission or abstract right, but for the purely utilitarian purpose of self-defence. The North fought against the South, not for the purpose of dealing out retribution, but for the purpose of saving the Union, and under the influence of a well-settled conviction that the Union was so valuable that it was better that 500,000 men should perish than that it should be broken up. To call the war a process of "punishing criminals," in virtue of some inner light as to abstract right and

wrong possessed by the North, is to compare the Northern people to the hosts of Simon de Montfort or the Duke of Alva. The Northerners occupied no such position. They were civilized modern men, who, as Cromwell said, "knew what they were fighting for, and loved what they knew." They were not crusaders or propagandists. In other words, they applied to their undertaking the simple test of *expediency*, the virtue, and indeed the obligation, of which in all such cases has been fully expounded by Burke, and more recently by Austin. Of course, fighting because it is expedient does not prevent a man's believing in the justice of his cause and warming into enthusiasm over it. But it does prevent his setting himself up as the vicegerent of God, and undertaking to reveal the secrets of his enemies' hearts and pronounce whether they were honest. There have been many occasions in European warfare in which both parties sang *Te Deums* for the same battle. Let us be thankful if we can avoid such absurdities here.

If this was the Northern position in the war, the proper policy now to be pursued towards Southern men is easily inferred from it. A man who asks himself: "Why did I go down and kill Southerners during the years 1861, '62, '63, '64? Was it because I was sent by God to inflict punishment on the wicked, or because their conduct hurt my feelings?" and who answers: "I killed Southerners because they were trying to break up the Union, the permanence of which I believe to be in the highest degree valuable both to the human race and to the American people, and with which all my own hopes and affections were bound up, and because I believed its preservation essential to the happiness and prosperity of all parts of the Union," has no difficulty in determining what his treatment of Southerners, now that the war is over, should be. He says at once, "I fought to bring the Southerners back into the Union, or, in other words, to force them to be my fellow-citizens. I succeeded; they are my fellow-citizens, and as such I owe them whatever treatment is necessary to secure their attachment to me and to my country, by forgiveness of injuries, oblivion of past grounds of offence, assistance in all times of danger, necessity, and tribulation, and a hearty co-operation in whatever seems likely to promote the safety, honor, and welfare of this nation." Burke has said that we cannot frame an indictment against a whole people. It might be added to this that no man is competent to sit in judgment on a whole people, and all talk of "crime" about the doings of millions of men is therefore irrelevant. When we say even that the course of the North was just, we mean simply that it seemed to us to be expediency in its highest form. We know there are persons among us who profess to be able to tell us what the absolute right of every question is, and who are ready to give their personal guarantee that God Almighty approved of the military operations of the United States against the Confederacy. But we do not argue with these gentlemen. Prophets always have their own way in debate. The question whether under this view we should be willing to commemorate the Southern dead in the Memorial Hall, is one which of course will occur to everybody; but the answer seems to us to be that the question is not one of conflicting duties, but of pure feeling. The Memorial Hall is an expression of reverence and affection. To put up tablets in it, therefore, to persons whom its builders do not reverence or love—*i.e.*, the Southern dead—would be a kind of absurdity difficult to describe, if it were not an act of hypocrisy.—Ed. Nation.]

A SOUTHERN VIEW.

To the Editor of the Nation:

Sir: In an admirable article in your issue of July 2, on the "Rôle of the Universities in Politics," you say justly: "We at the North owe to the civilized men at the South who are now, no matter what their past faults or delusions may have been, struggling to save a large portion of the Union from descent into heathen darkness and disorder, the utmost help and consideration. We owe them above all a free and generous welcome to a share in whatever means of culture we have at our disposal, and ought to offer it, as far as is consistent with our self-respect, in a shape that will not wound theirs."

You go on to consider the question whether the erection of the great hall at Harvard, "in memory of the graduates of the University who died in the war," would "tend to keep Southern students away from the University," and, in support of your conclusion that it would not, you refer to General Bartlett as having "uttered in a burst of unpremeditated eloquence, at the close of the proceedings" at the dedication of the hall, "the real reason why no Southern man need, and we hope never will, feel hurt by Northern memorials of the valor and constancy of Northern soldiers"—to wit, that "it is not altogether the cause which ennobles fighting; it is the spirit in which men fight"; and that "this test may be applied by each side to all the victims of the late conflict without diminishing by one particle its faith in the justice of its own cause."

These remarks of General Bartlett bring to my mind a conversation I had, at the time the building of the hall was determined on, with a classmate whose sympathies were with the North, as mine were with the South, during the war. It was his wish, he said, that the hall should be, to use your words just cited, Mr. Editor, "in memory of the graduates of the University who died in the war"; those on the Southern side, as well as those on the Northern. "But," said he, "the North is not yet ready for it; but the time will come when it will be ready."

It seems to me, judging from General Bartlett's speech and the *Nation's* article, as well as from a good many straws on the surface, that the time has come or is fast coming. What is to hinder the Northern alumni taking the thing into consideration between now and next commencement, thinking it over in all its bearings, and then coming prepared to unite in a cordial invitation to the friends of those who fell on the Southern side to put up tablets to their memory side by side with the tablets to those who fell on the Northern? I verily believe that such an invitation would be as cordially responded to, and that the tablets would be up before the commencement of '76; and then Northern and Southern alumni might meet on common ground, and rejoice together over a common heritage of glory. And would not this be *indeed* "a centennial monument worth having"?

I agree with General Bartlett that "the view of the nature of the struggle which is sure to gain ground all over the country as the years roll on, is that it was a fierce and passionate but inevitable attempt to settle at any cost a controversy which could be settled in no other way, and that all who shared in it, victors or vanquished, helped to save the country and establish its government on sure and lasting foundations." I recognize "the finger of God" in the result; not as deciding the right or wrong of either side, but as determining which side it was best for the welfare of humanity should succeed. If ever there was a just cause, it was that of Spartacus and his gladiators, but their success would have been the downfall of Roman civilization, and the shadow on the dial of human progress would in all probability have been set back by it fifteen generations, if not fifteen centuries.

E. J. Stearns.

Denton, Md., July 7, 1874.

Notes.

THE works, prose and poetical, of John Hookham Frere are to be issued in a new edition, of three volumes, by A. Denham & Co.——Scribner, Welford & Armstrong will publish shortly 'Bibliotheca Diabolica,' a catalogue of works relating to the Devil, "in two parts, pro and con, and serious and humorous; chronologically arranged; with notes, quotations, and proverbs, and a copious index." This can hardly be called dear at 25 cents. ——Dr. Fritsche's astronomical and hypsometrical observations in Northern China, Mongolia, and Mantchooria in 1869-72 are mapped roughly in No. 50 of the Berlin Geographical Society's *Journal*, and more carefully in the current issue (May 20) of Petermann's *Mittheilungen* (New York: L. W. Schmidt).

—A South Carolina gentleman, writing to us from Fort Motte, speaks of the plan proposed by Mr. R. S. Guernsey (*Nation*, No. 470, p. 6) of "celebrating the centennial anniversary of national independence by inducing each State to publish a roll of its men both rank and file who fought to establish our national Government." Mr. Guernsey's plan meets with our correspondent's warm approval. He says: "Permit an old man who, in the evening of life, bears with him to the grave a national pride which no revolution of political partisanship can destroy, to express his great gratification at this movement. . . . There is want of organization in our unhappy South to move in this matter, but it may be that the paralyzed spirit of our people can be restored again to activity through the activity of other centres." As a means of aiding to bring about this result, our correspondent encloses to us for publication a copy of some memoranda made by a South Carolinian Revolutionary soldier, Mr. John Postell, a note-book of whose indit-

ing is in the possession of his descendants, and, as our correspondent conceives, contains exactly the kind of information which Mr. Guernsey's plan calls for:

"The following were companions and messmates in the Old Second Continental Regiment of South Carolina infantry, while William Moultrie was Colonel, Francis Marion, Lieutenant-Colonel, and Peter Horry, Major—at Sullivan's Island, S. C., June 1776.—(Sg.) JEHU POSTELL.

"*Alfred Hugér. 2d Lieut.* in Capt. Horry's company, 2d regiment S. C. continental regiment—afterwards Captain in same regiment—joined Marion's legion and commissioned Major in 1777. Killed at Stono, near Charleston.

"*William Capers. 1st Lieutenant* in Capt. Horry's Company, 2d regt. S. C. Continental troops, joined Marion and made Captain of the Santee Scouts. Served at Savannah, Fort Moultrie, Eutaw Springs, Rugely Mills, Charleston. As brave a man as ever God let live.

"*George Sinclair Capers. Private* in Horry's Company, 2d S. C. Regt.; joined Marion with his brother, generous, brave, and full of all manner of fun. He could make a royal rum-punch, and as good a swordsman as ever made point or cut.

"*Jehu Sinclair Postell. Private* in Horry's company 2d S. C. Regt.; after regiment disbanded in 1776, Jehu joined Capt. Capers' Dragoons with Marion—being my brother, I might say too much of him if I were to give his mannie qualities as a gentleman and a soldier. He was the strongest man in Marion's legion.

"*Daniel Eggleston. Lieut.* in Capt. Horry's company and *Cornet*, afterwards transferred to Huger's 2d Regt. S. C. troops. When regiment disbanded he joined Colonel Lee, and became Capt. of Cavalry—a fine fellow he was—and *Jehu Postell* who writes this, and has no more to say of himself.

"*P.S.*—I must not forget the boy *Peter*, whose freedome we give on condition of his faithfulness. He could laugh louder, sleep sounder, and drink more rum than any person I ever saw."

—Mr. T. W. Higginson has been guilty of "journalism" in the last number of the *Woman's Journal*. Journalism is a generic name which includes a great variety of offences. In this particular sense, it consists in citing or referring to something an opponent has said in such manner as to make it mean whatever it happens to be most convenient for your own side of the argument that it should mean. The *Evening Post* was guilty of it when it alleged that we had objected to its making "any mention whatever" of M. Rochefort's letter to the *Herald*, the fact being that we had objected to its "treating his story of the Commune as worthy of credit." The New York *Times* was guilty of it when it said that the *Nation* "was of opinion that to assist a swindler to escape justice was quite right," the fact being that we had expressed an opinion favorable to the course of the Erie directors in compromising a civil suit brought against Gould, for less than the full amount of the damages claimed in the complaint. The offence is one which, in a well-drawn criminal code, would be put in the same category with robbing an orchard or hen-roost and milking other people's cows in the pasture for immediate personal use. That is, it indicates rather recklessness and *insouciance* than badness of heart, and all attempts to repress it should therefore be reformatory rather than punitive in their character. We subjoin, in parallel columns, the *corpus delicti* in Mr. Higginson's case:

[*The Nation.*]

In short, the position of conservatives is simply this: Woman's place in society, even in the most civilized countries—including her deprivation of certain employments; the greater importance attached to her purity than to man's; the objections to her active and public participation in the work of government; the nature of the marriage contract—is based on physiological considerations, the discussion of which is usually confined to professional journals and learned societies. We would rather not handle them in the newspapers or in the family circle. There are several objections of a grave kind to making them topics of common conversation among the young, and simple, and unlearned. But if you insist upon it, and upon treating our reticence as a sign of acquiescence in the serious changes you propose in our laws and manners, we certainly shall not be restrained by considerations of decency, and give you fair notice that we shall "invade your privacy" in a manner you will not like. We shall not sacrifice society to our squeamishness.

[Mr. Higginson's Rendering.]

The manner in which the New York *Nation* of June 25 treats those young girls who wish for higher education;—using toward them a coarseness of tone as brutal and discourteous as that which the *Nation* itself denounces in General Butler's speeches; and avowing the purpose not to be "restrained by considerations of decency," (p. 408,) *in attacking them, should they persist in petitioning for the best collegiate instruction, namely, that at Harvard and Yale;*—this is paralleled by many things that appeared in newspapers then held reputable, twenty-five years ago.

We supposed we had made it plain by punctuation that the foregoing description of "the position of the Conservatives" was put in the mouths of the persons now engaged or likely to be engaged in this physiological discussion—namely, such persons as Drs. Clarke, Maudsley, and others. If we have not done so, we presume the fault is ours; but, in any case, the interpretation of Colonel Higginson is a very aggravated case of journalism, particularly as the passage in which it was performed was devoted almost entirely to giving some account of a controversy actually raging, in which we have taken no part whatever, and as the small piece of quotation which he makes gives the rest of his remarks the appearance of being a mere paraphrase of ours. The phrase "invading your privacy" is quoted from Mrs. Howe's preface, in which she complains of Dr. Clarke's book as "an intrusion."

—If there be any marriage statistics in the last Census Report we have been unable to find them, and if they have been omitted it is an omission of some importance, because they would throw some useful light on the question of female education, and on the attempt which some persons are engaged in to reorganize society, on the theory that the body of women who will not or need not marry is so large that our social and political arrangements might safely be adapted to their needs. In default of statistics of our own, those of the last English census just issued are of considerable value, inasmuch as England is a country in which women find it vastly more difficult to get married than they do here. The population of England is 23,500,000 nearly. Of these 10,000,000 are under 20 years of age, and therefore may for political and social purposes be pronounced unmarriageable. Of the rest, 10,000,000 are either married, or widows or widowers, divided about equally between the sexes. The remaining 3,500,000 of unmarried marriageable persons over 20 are also divided equally between the sexes. Out of every 100 men in England over 20, 66 are husbands and 7 widowers, or 73 per cent. have been or are married. Of every 100 women of the same age, 61 are wives and 13 widows, or 74 per cent. have been or are married. In our recent article on the "Replies to Dr. Clarke," we estimated the percentage of women likely to marry at 70 or 80, which was, we now see, a close approach to the exact figure, even in an old country like England, in which marriage is difficult. We do not believe 80 is too high an estimate for the United States, so that what some of our women's-rights friends are really trying to do is to regulate female manners and education for 20 per cent. of the female population. We say *some* only, because many of the proposed reforms in female education would undoubtedly be a most valuable preparation for domestic life—*i.e.*, for the life which four women out of every five are destined to lead.

—It is something like a self-contradictory statement; but the *International Review* for July is as usual ill-edited, while as usual most of its articles are good. The table of contents is as follows: "William Cullen Bryant and his Writings"; "Coal and its Supply"; "Thirteen Years of Freedom in Italy"; "The Catholic Reformation in Switzerland"; "The New Revision of the English Bible"; "The Orthodox Church"; and the "Notices of New Books." This list, it is plain, is overweighted heavily with religious and semi-religious topics, and thus is badly made up for a table of contents of any international review of properly wide scope. From Professor E. B. Andrews's "Coal and its Supply" the general reader may get a notion of the disproportion that exists between the extent of our American coal-fields and those of other countries, the difference being vastly in our favor. This fact is usually looked upon by our citizens with hopefulness, not to say with a disposition to boast, as if we were ourselves somehow responsible for the coal-beds, or at all events for most of the better sorts of our carboniferous deposits. Professor Andrews, however, has found one American writer who has taken a more thoughtful view of the subject. "But," says this writer, a Mr. Macfarlane, "if we take a higher and more thoughtful view of the subject, we will observe the malevolence of that Providence which in its apparent anger has submerged beneath the ocean so much that might have benefited our race, or caused it to be eaten away through countless ages by the action of the waves, leaving only poor fragments to tell us of the much larger portions that have been removed. Hence we cannot doubt but that the earth, in its rocks as well as its soil, was cursed for our sake, and that far back in the geologic ages there was built up, by a Being who saw the end from the beginning, a mutilated planet as a fit habitation for a fallen race." This passage is another reminder of our good luck in escaping from the various beneficent Providences suggested from time to time by the philosophers, and in keeping on with the Providence whose malevolence seems so deplorable to Macfarlane. It is a pity indeed that three-quarters of our mutilated planet is covered with water instead of being rounded off with anthracite and cannel.

—Dr. Ray Palmer contributes to the *International* a biographical essay on Mr. Bryant and comments upon his poetry with zeal; but he has a subject whose main lines are not to be missed, and the essay is better than some of its indications would lead the reader to expect. "Thirteen Years of Freedom in Italy" is by Professor Angelo de Gubernatis, and the gist of it is that tourists who really wish to see the essential nature of the new, free Italy

should give less time to Italian monuments and the picturesqueness of Italian scenery and poverty, and should study with care the life and activity of Milan and of Turin—cities at which the traveller now takes but a glance as he passes eagerly southward to Florence and Rome and the Bay of Naples. It might be wiser; but tourists in these days go abroad neither for the purpose of instructing themselves, as once they did; nor of elevating the condition of the foreigner, as indeed they never did so far as we know; but of resting and amusing themselves. An article seeming more mature and solid than that of Professor de Gubernatis is the next one—"The Catholic Reformation in Switzerland." It is clear in its arrangement of facts and perhaps not the less to be trusted that it is the work of a writer (anonymous) whose sympathies and whose well-settled convictions are on the Protestant side. As illustrating at the same time the writer's clearness and the turn of his sympathies, we give the substance of his answer to a question supposed by him to be put by the reader—namely, Is this reformation a movement, *bona fide*, of Catholics, or is it but a demonstration carried on by old enemies of the Catholic Church, who seize on a small disaffection among the faithful to impose on the public by using the Catholic name? To this question he begins an answer by saying that the nature of the answer will depend altogether on the definition given to the term "Catholic." As every one knows, he says, Catholic polemics have two definitions of that term and two corresponding sets of statistics—one for assault, one for defence. Under the former, they speak of the 300,000,000 of Catholics in the world, of their voting strength, and so forth, and demand a proportionate share of the public moneys and the prison chaplaincies. Under the other, they protest against the unfairness of statistics setting forth Catholic crime and Catholic pauperism, and contradict reports of dissension in the Church by declaring all dissentients to be no Catholics at all or "half Catholics." In this latter view, says our author, if we regard as Catholics only the select, pure, and homogeneous sect, far from overwhelming in point of numbers, with whose members their pastors can find no fault, then the reformation is not a *bona-fide* movement of Catholics. But if we use language as it is ordinarily used, the movement is strictly a spontaneous movement among Catholics themselves, and already has accomplished a great deal in the way of freeing the Swiss Catholic from Ultramontanist dictation, and will accomplish more. We do not see in what respect the principle on which the Roman Catholics act in using, as above set forth, two definitions (to call them definitions) differs from the principle on which other religious bodies act in the same and similar cases. But the writer's remarks make it clear in what sense he gives his answer, and his answer with its supporting facts as set down by him in his article is worth attention. "The New Revision of the English Bible" is by Professor Fisher of Yale, and is readable, though it does not pretend to any newness of matter or any deep-going views. It puts plainly with sufficient illustrations the necessity of the Revising Board's not being so conservative in making changes as really to leave the present Authorized Version still in the field. Thus much labor would be lost and a great opportunity lost also. "The Orthodox Church," by the Princess Dora d'Istria, gives some account of the history and present condition of the Greek Church and its relations to Western Catholicism.

—*Brownson's Quarterly Review*, written wholly by its editor, contains nearly two hundred and fifty pages, and the quality of its contents offers no less evidence of the editorial vigor than the quantity. The article which will be of interest to most readers, is the notice of the Marquis de Chambrun's book entitled 'The Executive Power of the United States,' which is highly praised, though, of course, on some points issue is taken with the author's views. For instance, we agree with the author, says Dr. Brownson, that the abolition of the electoral colleges would clear away a practical absurdity; but we do not agree with him and some of our native politicians that the change would tend to break up the caucus system, weaken the tyranny of party, or give greater freedom of choice to the voter. There would remain the same motive for party organization as now, and as strong a reason for caucus nomination. Indeed, as things are now, under the present system, the electors count for nothing with the voters in a Presidential election; it is not to secure the return of the electors, but of the party candidate for the Presidency, that party machinery is employed as we see it and regret to see it. Pursuing the general subject, Dr. Brownson goes on to say that in times past he, in common with his countrymen, has declaimed against the strict party organization which obtains among us, but that now he knows well that party tyranny is a necessity of popular government. And this because, if the truth must be told, the democratic form of government is the most unnatural form of government under the sun. It is utterly opposed to the truth; the first family, the first school we visit, the first crowd in which we mingle, shows this;—the one or two lead, the great majority follow and do as they are bid. Hence a government democratic in form becomes practicable only when human nature is neutralized by party organization, party machinery, and party discipline. This is not a very new truth—it has been known that minorities always rule; nor a very fruitful lesson, for what it is desired to know is, how minorities can be made to rule better than they have hitherto; but our author's way of looking at political matters will be so fresh to so many American formula-swallowers, that to read what he writes would be highly medicinal to our political class in general. To go on: he says, in speaking of the "one-man power," or "Cæsarism," of which we used to hear a generation ago and are now hearing again, that the clamor about it he regards as both senseless and mischievous. The power of the Executive, already limited by the Senate's right of confirmation, has, within a few years, been still further limited by the tenure-of-office law. What has really happened is, that a Cæsaristic power has, by the course of recent events, been lodged in the hands of an irresponsible body of Representatives and Senators, who exercise the whole executive patronage for their own and their party's aggrandizement. We need not, however, speaking by the way, disguise from ourselves the fact that the President's power in this respect is in practice enormous. The worst of it is, responsibility has in a great measure disappeared. To illustrate Dr. Brownson's readiness to speak out his individual opinions, and the danger of his running at any moment from sense to whimsicality, we may quote his peculiar view of the nature of the right of secession: "We maintain," he says, "and have always, except for a brief moment before we had fully investigated the question, that the States had a right to secede if they chose—the same right that a sovereign has to abdicate; but we denied, and deny, that by seceding they became independent States, or territory independent of the United States. By seceding they lost their sovereign rights, which were held only in the Union, and became simply people and territory subject to the Union"—a doctrine of secession as agreeable to the South Carolinian ear as Sherman's guns themselves. Illustrative of this same sort of individualism and positiveness are some of the odd little book-notices, as for instance of 'Dame Dolores,' a book by a writer whose name is not given to the public: "We suppose we ought to know, and probably have known, who is the author or authoress of these charming stories, but if we have known we have forgotten. There is more pride than humility in publishing a book anonymously." There is nothing like having these things settled. There are six articles besides those which we have mentioned, "Count de Montalembert," "Gallicanism and Ultramontanism," and four others, each with its due amount of Brownsonism.

BURTON'S HISTORY OF SCOTLAND.*

WE have more than once taken notice of the new edition of Burton's 'History of Scotland,' of which the closing volumes have now been received. It may fairly be pronounced one of the most important and best-executed historical undertakings of our time. The complete history of any country is, in the rapid accumulation of materials and the stringent demands of criticism at the present day, a task which might well daunt the most courageous. And we can bestow no higher praise upon this book—none, that is, which better expresses its literary rank—than to say that neither England nor America possesses any complete history which can compare with this in merit; nor, in the English language, any modern nation of the European Continent, unless it be France. The author has traversed the seventeen centuries embraced within the scope of his work with a steady step and a clear eye, and produced a book which is from beginning to end at once readable and worth reading.

It was not to be expected that in so extensive and varied a field all portions should be done equally well; and we should say that, on the whole, the early period is less well done than the later. The author's temper is too cautious and his tone of thought too sceptical to be thoroughly satisfactory in a period which calls for a somewhat higher degree of imagination than he possesses. The results in these early chapters are very apt to be merely negative; the reader finds a thorough examination of the evidence, a clear and impartial statement of arguments on both sides, and a very sagacious consideration of them, and is then dismissed with the remark that the evidence warrants no conclusion. That this proceeds not from a lack of capacity to decide controverted points, but from a defect in historical imagination and an overconscientiousness as to going beyond the record, is abundantly proved from Mr. Burton's masterly treatment of controverted points further on, especially in the case of Mary, Queen of Scots. He has an eminently judicial mind, but it acts most freely in the clear light of distinctly historical times.

This most vexed of the moot questions of history, the guilt or innocence of Queen Mary, receives from Mr. Burton an almost disproportionate

*'The History of Scotland, from Agricola's Invasion to the Extinction of the last Jacobite Insurrection. By John Hill Burton, Historiographer-Royal for Scotland.' In eight vols. (and Index volume) 12mo. Edinburgh and London: William Blackwood & Sons; New York: Scribner, Welford & Armstrong. 1873.

attention. The entire fourth volume is devoted to the nine years (1560-69) between the death of Francis II. and the adjournment of the Commission of Enquiry held in England after Mary's flight thither. It is a remarkable piece of work. There is no aim at picturesqueness or dramatic effect, in which respect his treatment of it is strongly contrasted with Mr. Froude's (whom, by the way, Mr. Burton always mentions with respect). The result, however, is one which possesses all the most desirable elements of the dramatic and the picturesque. The career of Queen Mary is narrated with the greatest fulness and care, and the events are so grouped as mutually to illustrate each other and to help the reader to place himself at the point of view of a contemporary. The most scrupulous impartiality is observed, so that hardly a clue is given to the judgment which is about to be passed; and it is not until the simple and direct narration, by its own accumulation of evidence, has made her guilt almost self-evident, that the writer allows his own opinion to be seen. Neither does this appear to be the artifice of the advocate, but the logical process of one simply aiming to arrive at the truth. For example, in the account of the murder of Darnley, Mr. Froude, making use of the facts afterwards put in evidence, tells the events as they occurred (or are considered by him to have occurred), making free use of the casket-letters as unimpeachable evidence. Mr. Burton makes no allusion to these (although he does make some use of Crawfurd's concurrent testimony) until he reaches their discovery in the due course of his narration, constructing his story from independent sources, so that his argument up to this point depends in no way on their validity. This method he justifies by an interesting note (p. 253), which explains and illustrates his judicial method of treatment: "In the supposition that they are genuine, they were a secret between two criminals which did not yet begin to influence others; and it seemed to be the historian's proper duty to deal with what was known to, and consequently influenced, the actors at large on the political stage. From the 20th of June, 1567, however, the ruling power in Scotland took its stand upon the import of these letters; and it is therefore from that day that they properly become a part of public history."

Mr. Burton's style is strong and masculine, occasionally with a slight lack of finish which is not a great defect, and with a racy humor which lights up some of its most tragic chapters. This is nowhere more conspicuous than in the account of the intercourse between Mary and Knox—a juxtaposition which certainly has its comical as well as its serious side. "It occurred to him to put in a word of comfort founded on his domestic experience. Weeping was far from pleasant to him, and he could scarce stand that of his own boys when under paternal flagellation. But on the present occasion, that he should be assailed by tears was more unreasonable, the queen having no just cause of offence, since he had but spoken the truth, as his vocation craved of him. He was thrust for a time into an ante-room among the queen's ladies—a body for whom he had often expressed intense disgust, railing at their 'stinkin' pride' and the 'targetting of their tails and the rest of their vanity,' all calculated to 'provoke God's vengeance not only against those foolish women but against the whole realm.' The grim preacher was probably no more welcome to them than they to him; but he resolved to improve the occasion, and to this accident we owe a sentence of quaint and solemn moralizing which may fairly match with Hamlet's over Yorick's skull" (IV., p. 74). A favorite object of his sarcastic humor is Queen Elizabeth—he would be no Scotchman if he loved her. "The sacredness of the sovereign was to her the most imperious of human creeds. She had counted on it as absolute when she coquetted with her sister's subjects; they might go so far, but there was no risk of their going further. The leaders in Scotland had now committed the most awful crime that it lay within the compass of human wickedness to commit. Blasphemy against the Almighty was merely a rash use of words, doing nothing which penitence might not recall; but here was blasphemy put in practical and irretrievable shape against the representative of the Almighty upon earth" (p. 295). Again: "The other document was a letter of special instruction by Queen Elizabeth to her commissioners. These unhappy men, if they had not known all too well the voice which spoke to them, might well have said, in the voice of Scripture, 'Who is this that darkeneth counsel by words without knowledge?' To abbreviate the meaning of sentences so adjusted as not to have a meaning is impracticable, and it would not aid the narrative to introduce such a document in full. It is more suitable as a study in royal or feminine correspondence than an aid to the reader, who could only be as much perplexed by its contents as were those to whom it was addressed" (p. 430). Better, in this vein, is what he says of Buchanan's instruction of the young king in the principles of government: "Buchanan was then at work upon his 'History'; and as he had some thirty fictitious kings to deal with, he was enabled to adjust the conduct and the fate of each to his own satisfaction. His 'History' became, indeed, what the French call the 'pièces justificatives' of his essay" (Vol. V., p. 139).

No portion of the work approaches the fourth volume in tragic interest, although every succeeding one has its episodes and characters as universally familiar and inexhaustibly fresh as this of Mary, Queen of Scots. Probably no field of history is so crowded with the names and events of romance as that embraced in these closing volumes; and all of these, Montrose, Claverhouse, Argyll, Prince Charlie, the Gowrie Conspiracy, the Murder of Archbishop Sharp, the Massacre of Glencoe, receive worthy treatment. The prevailing character of this later period, however, is serious and earnest. The great religious controversies, and the organizations and contests growing out of them, form the background of later Scotch history; the stern spirit of John Knox continued to inspire his nation. Able and successful as Mr. Burton is in the more stirring portions of his work, it yet seems to us that his favorite field is the great religious and political movements which grew out of the Reformation and out of the antagonistic phases which the reformed religion assumed in the two sister kingdoms.

Of subordinate topics, we will especially mention the manner in which architectural remains are turned to the purposes of history, and we will instance, besides the numerous discussions in the early volumes, the account of the Cathedral of Glasgow, in connection with the Glasgow Assembly (1638), Vol. VI., p. 222, both text and notes. We were inclined to think that historical geography was a weak point with Mr. Burton, and, as it is, he does not make of it nearly so much as we could desire. There is no general description of Scotland or of the relation of its history to its geography, and in particular we miss a clear view of feudal Scotland. There are, however, numerous scattered passages upon these points which, if collected in one, would make a very considerable amount, and these are all characterized by Mr. Burton's clear and vigorous treatment. We will mention particularly the account of the dominions of the Huntlys, Vol. III., p. 59, and Vol. VI., p. 206. The relations of the Isles to Scotland and Norway respectively, and indeed the whole treatment of the early international relations of these northern powers, are among the most striking and satisfactory portions of the work.

One of Mr. Burton's prominent habits of mind is his power of placing himself intellectually in the atmosphere of the events of which he is treating—one of the sources of his eminently fair and sagacious judgment. Thus, of the murder of Rizzio: "Much of the accusation and defence wasted on the characters of that age arises from the supposition that, like a well-principled citizen of the present day, any one hearing of an intended crime was expected to go and inform the police. People in the public world had too much anxiety about themselves to think of others, and only the strongest personal motives would prompt one to interfere with any act of violence. An attempt to thwart a crime by which his cause would profit might have justly exposed a man to the charge of insanity or gross duplicity" (IV., p. 151). Again, of the death of Archbishop Sharp: "A word, however, has yet to be said for those who have not thought fit to denounce this crime in the strongest language available for the purpose. It is common in history to use the term 'assassination' rather than 'murder' on such occasions. The practice is useful, as it separates two acts of different character from each other without conceding to either the palliation that may be conceded to casual slaughter in troublesome times. Private murder for personal revenge or for robbery is a different form of crime from the act by which a public man is put to death as a punishment for his political creed, and as a means of stopping his political career, even although it be done without any form of trial or other judicial procedure" (VII., p. 217).

Mr. Burton discusses somewhat elaborately the great question of the feudal supremacy of England; but the gist of his argument is found in the opening words of the second volume relative to the Treaty of Falaise (1174): "The much-desired infeudation of Scotland was now complete, at least on parchment. In the great homage dispute, on one side of it at least, a perverse pedantry has depended on ceremonies and writs instead of broad historical facts; as if all that a high-spirited people could gain by ages of endurance and contest might be lost by a slip of parchment. But it is odd that these pedantic reasoners should have overlooked how strongly this transaction bears against them. If the Scots people were really under feudal subjection to the Norman kings of England, what need to create that condition by a hard bargain with a prisoner? Or, supposing that the condition had really been established, and the King of Scots was a rebel, then the phraseology of the documents would undoubtedly have shown as much, and would have renewed or confirmed the past. What the conditions of the Treaty of Falaise do, however, is to create the new condition of vassal and superior from their date. They explain the opportunity and certify the use it is put to." A strong argument, it must be admitted, and clinched by Richard Cœur de Lion's revocation of the treaty in 1189.

A few slight errors may be pointed out. In Vol. II., p. 321, Louis X. of France, instead of Charles IV., is said to have died in 1328. On p. 344, Ro-

bert II. is spoken of as nephew, instead of grandson, of Robert Bruce. Vol. III., p. 8, King Christian I. is spoken of as if he were primarily King of Norway instead of Denmark. Vol. IV., p. 5, the Emperor Ferdinand is called Frederick. The book is handsomely and correctly printed, and possesses the great treasure of an index volume. Maps and plans would add much to its value, and so would a few tables of genealogy and of contemporary sovereigns.

RECENT WORKS ON MENTAL HYGIENE.*

WE group these three books together because the two latter, though they cover a wider ground, are yet in reality more important manuals of mental hygiene than the American volume which bears this exclusive title. This latter does not deal, like those of Ray, Feuchtersleben, etc., with didactic maxims, but is a concatenation of quotations, statistics, and propositions regarding the effect of different circumstances on the mental life, from which the reader is avowedly left to draw his own practical conclusions. Though it sadly lacks unity and smoothness, the original portions are well written, and the quotations make it entertaining. Many persons will probably find it useful, though we can by no means consider it in the light of a valuable contribution to knowledge. The wisdom of some of the author's ideas is more than questionable. Alluding to the fact that steam, electricity, and mechanical inventions "are superseding the necessity for the stalwart frames and heavy sinews which were in such prime demand a few years since," he says: "When the brain and nervous energies, backed by creations of mechanical art and skill, assume the countless tasks so long performed by human hands propelled by hardy muscles under the impetus of hardier wills, we may be pardoned for questioning the wisdom of continuing to maintain that degree of muscular development which obtained among our forefathers, as a necessity of a civilization which no longer exists." This surely is singular language for a physician to use. We believe, on the contrary, that the indirect benefits we shall get from "keeping up our muscle" (even supposing our author to be right in his idea that the new civilization will do away with any very urgent *economic* necessity for it), will be quite as important as its immediate mechanical uses have ever been; and that, if our race ever gets to disregard muscular strength as an element of human perfection, it will be far gone on the path of degeneration. A well-developed muscular system means something more than the ability to raise a given weight. It is apt to be correlated with calm nerves and strong digestion, with joyousness and courage of every sort, with amiability and all manner of sound affections and sensibilities. Society owes an immense debt to its nervous temperaments, its Shelleys, its J. S. Mills, and others. But who would not shrink from having the *type* grow strenuous and hectic like these? The old vascular and muscular breadth is better for the stock of human nature, and we trust that here in America we shall never lose the wholesome sense of this, but by the increasing interest taken in athletic sports and the honor paid to their heroes keep up in some degree that admiration for bodily perfection which maintains itself perforce in military and aristocratic societies, but which in an age of business and mere brain competition may easily decline without the support of a special æsthetic cultivation. Darwinism has begun to awaken people's consciences about the responsibilities of breeding in the human race; and we fancy that, before long, nervous brides and bridegrooms without jaws or shoulders will be rarer to meet than they unhappily are now.

In the admirable practical chapter at the end of Dr. Maudsley's book he says that the hereditary element holds the first place in the production of insanity, and that the neurotic or overnervous type, which is often the type of genius too, may be the first step in the downward career. He adds that the tendency often is to an intensification of this type by marriage:

"In the first place, those who have it are prone, by a sort of elective affinity, to seek in marriage persons who have similar mental qualities, and with whom therefore they have a sympathy of tastes, feelings, and thoughts. Emotional susceptibilities, wild flights of imagination, and idealistic aspirations excite their admiration and sympathy; while common sense, subordination of feeling, sober reflection, and a calm and regulated activity are repugnant to their nature. In the second place, by a similar natural affinity, they select those external circumstances of life . . . which are grateful to them, and so intensify their peculiar tendencies until these perhaps undergo a pathological development. In the third place, they apply to their children the same mismanagement which they apply to themselves. These are twice cursed: cursed in the inheritance of a bad descent, and in the training which they get," and too often they become finished lunatics.

To those who think that no evil seems worthy of that name when compared with the evil of insanity we cordially recommend Dr. Maudsley's excellent little volume. In it they will learn that the evil is not wholly beyond human power to avert, and that right breeding is one of the most important means to this effect; although he is less hopeful than we are that the quality of "sexual selection" may be gradually improved by enlightening public opinion on the subject. It is in the minority of cases that marriages are due to the blind and frenzied extremity of love. Once expose certain kinds of matches to public reprobation, and the parties will attract each other less. The current ideal of character for each sex is, like other æsthetic ideals, always in part a matter of fashion, and, like our beliefs, is largely obedient to the reflective consciousness we entertain of the excellence of cultivating them. We encourage a taste or passion or intellectual tendency by justifying and adopting it. We shake its power by doubting its dignity. And so if reflection, public fashion, the newspapers, and novels all begin to decry sensibility and refinement when they form the all-in-all of character, and to reinstate manliness and bodily soundness on the one hand, and simple loveliness on the other, into the rank they held in the fiction of old, why, it will be strange if some individuals do not fall in love accordingly, and the succeeding generations acquire a tinge more of burliness than would otherwise be the case.

Dr. Carpenter's book deals more with the individual than the race. It is a treatise of descriptive psychology, written with that polish of style and copiousness of illustration which have so distinguished the other writings of the author. Holding firmly the doctrine that all mental action is correlated with brain function, and equally firmly the doctrine that in volition we have a change of thought not fully predetermined by its cerebral antecedent, his main thesis is to work out the interaction of these two principles, and to show the way in which modes of action originally due to separate volitional impulse grow, by virtue of the great law of habit, automatic, and matters, so to speak, of second nature. So that a persistent will really moulds the organism to its purposes, and, in so far as the tendency to habits thus organized may be inherited, has a creative dignity.

"We have thus a definite physiological *rationale* for that 'government of the thoughts' which every moralist and religionist teaches to be the basis of the formation of right character, and therefore of right conduct. And the writer cannot but believe that there are many upon whom the essentiality of intellectual and moral *discipline* will be likely to impress itself with greater force when they are enabled thus to trace out its physical action, and to see that in the mental as in the bodily organism *the present is the resultant of the past;* so that whatever we learn, think, or do in our youth will come again in after-life, either as a nemesis or as an angel's visit."

We think that this good purpose has been carried out with admirable thoroughness and skill. Clergymen and teachers will find the book a well of valuable suggestions, and for youthful students it will prove a very fascinating introduction to mental science; the unusual breadth of its scope and abundance of anecdotes, and the full account of morbid mental phenomena, helping to atone for a certain want of analytic depth. We may say, too, now that "spiritualism" is again exciting public attention, that Dr. Carpenter has in this book taken the pains to prepare an elaborate and careful refutation of what he regards as its follies and delusions.

CHERBULIEZ'S SPAIN.*

IN four essays, originally published in the *Revue des Deux Mondes*, M. Cherbuliez discusses the Spanish Character and the Constitutional Monarchy; King Amadeus and the Democratic Monarchy; the Commencement of the Spanish Republic; the Crisis of the Spanish Republic; the Constitutional and Alphonsist Parties; and in an Appendix, which bears date of the 8th of February of the present year, the long series of insurrections and pronunciamientos since the revolution of 1868 is continued to its latest chapter—the *coup d'état* of the 3d of January, 1874.

M. Cherbuliez approaches his subject with the keen sympathy of a Frenchman for a country as unfortunate as his own, and yet containing, "in spite of Carlists and pétroleurs, of bloodshed and unpaid coupons, more real happiness than Prussia, the most governed of all countries, or than industrious and opulent England." In explanation of so peculiar a phenomenon, he draws on his intimate acquaintance with Spanish life and politics in all their varied aspects, as well as on the resources of his cultivated and brilliant style. M. Cherbuliez not only explains and defends but evidently shares the enviable hopefulness of the Spaniards under their trials, and professes his faith that "whatever may be the future destinies of Spain, her government can only be a free one." Curiously enough, the ardent admirer of Castelar, "whose

heart and talents grow with his responsibilities," accords to Isabella II., in spite of her faults and temptations, the glory of linking her name to a decisive epoch in the history of Spain. . . . During her reign the very genius of the nation was transformed. . . . Spain, throwing off the yoke of her traditions, became the home of free discussion, and applied to the study of her past and present that critical spirit which distinguishes modern peoples." And yet the downfall of Isabella was the consequence of a purely military rising, in which monarchists of all shades joined hands, and the direct fruits of which were reaped by Marshal Serrano and General Prim. When, on the 18th of June, 1869, the Cortes proclaimed the former Regent of the kingdom and the latter President of the Ministry, "the Republicans could only complain, protest, and wait."

The conspicuous part played by Prim during the time when Spain vainly offered to the princes of Europe her vacant throne, is depicted with great force and vividness, and the pages devoted to the intrigues which led to the ephemeral reign of Amadeus form, perhaps, the most interesting portion of M. Cherbuliez's book. The example of Amadeus, to whose many good qualities ample justice is done, "and who had only one unpardonable fault—that of being *impossible*"—proves "that the election of a sovereign by an assembly which seeks to escape at any price the dangers of a republic is sometimes the most hazardous of ventures." And yet that unfortunate reign, the first day of which witnessed the assassination of Prim, the author of its existence, was terminated, not by the unanimous decision of a free people, but by the intrigues of a Republican faction culminating in the famous Hidalgo affair.

"The Spanish Republic was born under distressing circumstances. Everything appeared to be against it; the fairies who attended its birth seemed to have laid a curse on its cradle, . . . and all their predictions were fulfilled. The poor daughter has seen two fathers claiming her as their offspring, and she nearly fell a victim to their quarrels. She has not wanted inveterate enemies, nor—what is worse—vexatious friends, and, with the exception of a little republic, all the countries of Europe have refused to admit her into their society. And on the strength of these auspices people fond of prophesying have predicted that twenty days would be the limit of her existence. She exists nevertheless, whatever the future may have in store for her, and her constitution, which has withstood such cruel attacks, seems to have gained strength in the strife. If she gains her cause, she will owe thanks to herself only, and she may then boast that her desire to live has accomplished all, and that neither fortune nor men have lent her aid."

In the same spirit of subdued optimism M. Cherbuliez predicts the final triumph of liberal ideas in Spain, even while tracing her struggles with Carlists and Intransigentes and the vain efforts of the Republican leaders to give stability to her institutions.

In the last pages of this attractive volume, which were written after the *coup d'état* of General Pavia, and added in the form of an appendix, M. Cherbuliez proposes for Spain the Presidency for a long term, like MacMahon's, as perhaps the best temporary expedient. But with the fall of Castelar his hopefulness seems to have given way, and he impressively and almost mournfully concludes:

"However excusable or useful may have been the abrupt issue brought about by General Pavia, it has for ever destroyed the illusions of those who imagined that the character of Spain had been modified, and that the era of military insurrections had passed away. It is now evident that nothing has changed in the Peninsula—that there is only one pronunciamiento more. It has been the misfortune of Spain for the past fifty years to have allowed her army to become the universal tool of politics; but it has been her good fortune, as well as her privilege, that the soldiers who have ruled her destinies have not practised the politics of the barracks (*ne font pas de la politique de caserne*). The Spanish people have lived, and will for a long time continue to live, under a régime of Pretorians who have parliamentary spirit, enjoy free discussion, and allow it to take its share in the government of human affairs. It is to be hoped that these Pretorians will never renounce their liberalism. May they establish in Spain a government that shall reconcile liberty and security, allow her to restore her finances, to develop her industries, to work and to think—in short, to emerge from the precarious state in which a nation, unfit for any enterprise, is compelled to devote all its energies to a humble and painful struggle for existence!"

THE NORTH AMERICAN REVIEW FOR JULY.

THE article entitled the "Hanlin Yuan," with which the *North American* opens, is an account of a learned body among the Chinese which in its general character resembles the French Institute. The differences are important; but, speaking compendiously, the two bodies are alike in being composed of selected men of learning, who work under the encouragement of state honors and patronage. The first few pages of the article are confusing, the author apparently not being a very lucid writer at the best nor on any occasion, and apparently on this occasion not having put himself into the place of the Western reader to a sufficient extent to know that to the Western ear the terms Ming, for instance, and Mingwang, and Kienlung, and Tsing are not full of meaning, chronological or otherwise. But of the nature and duties of the Hanlin Yuan a definite notion may be got from what he tells us, and he promises to tell more in a future article, which may possibly have the effect of making this one clearer. The society was founded in the seventh century by Kaotsu, a monarch who for a score of years afterwards was embroiled in civil war. His son, Shemin, by-and-by coming into undisputed possession of the throne, and recollecting the poets and philosophers whom he had read by the camp-fire, at once addressed himself to the promotion of learning, but without confining himself to the beaten paths of tradition. He not only issued his decree, as his predecessors had done, summoning from their retreats able men and distinguished scholars and commanding their attendance at court, but he installed them in his palace and organized them into a body which he regularly and frequently consulted. This council he called the Wen-hio-Kuan, and it was the germ of the Hanlin Yuan, or Forest of Pencils. This name the society acquired because of Shemin's resolution to form a library which should surpass in magnificence anything that had yet been seen. To effect this result, transcription on a great scale was necessary, and the king accordingly ordered a fresh levy of scholars, who should be elegant scribes as well as able men, and who should use a perfect forest of pencils. The name given these transcribers eventually came to be given to the whole membership of the academy, and this though the peculiar occupation of the scribes themselves almost immediately passed away. For not very long after the establishment of the institution the art of printing was discovered, or at least far more widely applied than ever before, and the art of the copyist was superseded. The scribes, relieved from the drudgery of copying, were at liberty to turn their attention to composition, "and in China in the eighth century, as in Europe in the fifteenth, the art of printing imparted a powerful stimulus to the intellectual activity of the age." So far as Mr. Martin's chronological backing and filling makes it possible to know what he is driving at, we should say that it was this period which saw the beginning of that study of "style" which has enabled the most flowery Chinese men of letters so far to excel the outside barbarian, and so vastly to improve upon the writings of their ancestors, who, as the native critics allow, were more studious of matter than of manner and minded too little about "art for art's sake."

From that day to this, now twelve centuries, the Hanlin Yuan has been maintained in honor and its constitution has undergone no marked change. Mr. Martin gives a somewhat paraphrastic translation of the constitution, but still finds it necessary to make full marginal explanations, to which we refer the interested reader. He also explains in detail the character of an academician's scientific attainments. These are of a quality to afford proof sufficient that it is not by his acquirements in science that it would be fair to try him: comets and eclipses are to him portents of calamity; the stars are characters in the book of fate; the earth is so far from being globular that in fact on the contrary it is flat and in shape it is square, the heavens being round; it is however the centre of the universe, just as China is the centre of the habitable earth, and for this conviction he can not only plead his own books, but quote the teaching of those astronomical Jesuit fathers who, three hundred years after the death of Copernicus, continued to instruct his ancestors in the system of Ptolemy. Zoölogy he knows to the extent of being aware that when a tiger plunges into the sea he becomes a shark, while sparrows using the same means are transformed into oysters—that is to say, he has for the second of these metamorphoses the authority of the canonical books, and for the first he has the warrant of a general belief which it is little worth while to question. Arithmetic is an affair of shopkeepers, and mechanics he disdains because of its relations to handicrafts and machinery. Of general physics he has an ill-defined theory, but of the five elements upon which this theory is based he can give a luminous exposition—namely, that it is the nature of fire to ascend; the nature of water to run down hill; the nature of metals to be pliable and subject to change; the nature of wood to be either crooked or straight; and the nature of earth to serve the purposes of agriculture. These propositions are the bed-rock of human knowledge, and such they are more clearly seen to be as one examines this frame of things and observes the correspondences which run throughout it all. There are five elements, and are there not five fingers on the human hand? the elements are five, and so are the musical tones, the great mountain ranges of the world, the senses, the planets, and the colors—a cosmos to please Humboldt himself, to say nothing of Swedenborg or a mystical interpreter of Scripture. This system is not only beautiful and beautifully simple, but it is a practical system, fitted to all the needs of human life. Thus, is the academician ill of a fever, which he contracted on shipboard or in a wooden house? As he knows at once, or as his physician tells him, wood produces fire, and what is wanted to restore the balance of the patient is earth—*i.e.*, life on shore or exercise on the ground in the open air. And yet, very properly observes Mr. Martin, it would be a great error to judge of the intel-

lectual power of this person by the correctness of his knowledge of such things as go to make up a modern education in the West. In such knowledge he is a child, but in mental force he may at the same time be a giant. Certain readers, wishing to emphasize this remark to their imaginations, might recall the impression made upon them by seeing in the flesh or in photography a man like the late Mr. Burlingame surrounded by educated Chinese, with their well-bred, well-trained air; or one of our White House assemblages surrounding the Japanese ambassadors recently in this country.

The second article in the *Review* ("The Platform of the New Party") is by Mr. Brooks Adams. Its facts and reasonings are sound rather than new. They have in fact been gone over very often within the last few years, but it may probably be found useful to have them all gathered as here within a moderate compass. The writer's views are not rosy; rather, he judicially but firmly excludes rosiness of view. After following down the main lines of our political history from the days of Hamilton and Jefferson to these present days, he sums up by saying that, General Grant having let slip his great opportunity of restraining the usurpations of the legislative body, the dominant party is now fairly a corrupt consolidation, centralization party, which has definitely acquired the habit of using the central Government as its chief support in all State politics: "Custom, each day deeper rooted, has developed an unwritten law stronger than any statute or bill of rights; and the law which has been declared is that the will of the majority shall be supreme, the Constitution to the contrary notwithstanding." In proof of this proposition, the cases of Louisiana and Massachusetts are cited, and we have over again the familiar story of the "capture" of the one State and the attempted capture of the other by politicians, behind whom was all the power and influence—without which these politicians could have done nothing—of the central Government. It is no pleasanter a story than ever, and the lesson taught by it needs to be insisted upon; but too absolute and naked insistance upon it leaves it with less effect on the Massachusetts freeman than it should have, and in so far forth prevents his paying proper attention to his brethren down beside the Mississippi. As for the platform of the new party, what must be proclaimed in it is hostility to demagogues, for the activity of demagogues is really the complaint of which we are likely to die, and to die at once unless we can choose a strong President who will curb the Senate, confine Congress to its proper functions, and who will be able to conceive and to execute a broad constitutional policy—one who above all else will do battle for the courts. The necessity of electing a President of this description is to be made the first plank in the platform; the second is to be the reform of the civil service so as to abolish rotation in office, make the tenure a good-behavior tenure, and forbid placemen from meddling with politics; the third thing is "to free minorities from their thraldom." Unless these things be done, and unless the press and the people rise to the level of the emergency, "the tale is well-nigh told. . . . A little longer, and it will be too late." As we have said, our writer does not take a sanguine view of our affairs; on the contrary, *venienti occurrit morbo;* whereas we may be permitted to hope that whoever will go slower may escape with life.

"Darwinism and Language," by Professor W. D. Whitney, is concerned with one of the subsidiary questions which surround the main evolutionary controversy carried on by the biologists. This subsidiary question is as regards the bearing of language on the controversy. So many wonderful things, says Professor Whitney, have been brought to light by the aid of language during the past fifty years in reference to the prehistoric history (so to call it) of the human race, that it cannot but have occurred to many to ask whether linguistic science may not also have a competent judgment to pronounce as regards at least the last asserted step in the infinite series of transmutations—namely, the development of man out of a lower, a simoid animal. And it so happens that in the opinion of two linguistic scholars of eminence, both of them Germans, linguistic science has this competent judgment to pronounce. One of the two is Professor August Schleicher of Jena, the other Professor Max Müller of Oxford. But, unfortunately for the general public, these two eminent professors have reached two conclusions which are diametrically opposed each to the other. Schleicher is sure that Darwinism is true and that the invincible proof of its truth may be found in evidence furnished by language. Müller, on the other hand, relies upon language to show that Darwinism is not and cannot be true. Professor Whitney, for his part, with that coolness and reasonableness possessed by him in a degree which we may be pardoned for saying is rare among workers in language, thinks that we may all for some time yet fairly wait before making up our minds until the biologists have brought their warfare more nearly to an end, and till victory has more certainly declared herself on a particular side. He proceeds to show that at all events we need not feel debarred from doing this because of any arguments brought forward by Professors Schleicher and Müller. He takes up their theories one after the other, dealing thus with Schleicher: Schleicher's argument has made the substance of several pamphlets; but, says Professor Whitney, it lies in a nutshell. It is as follows: Languages are living organisms, with their own laws of development, and are not dependent on the beings by whom they are used. Now, since it is beyond question that languages develop and become transmuted; since a single-stock language ramifies into a variety of tongues exhibiting differences as marked as those which distinguish the genera and species of animals and plants, why, it cannot be denied that living organisms do vary, and vary as rapidly and widely as the most ardent Darwinist could desire. And if organic beings of one class, then of course those of others. *Quod erat*, etc. Unluckily, the answer to this argument lies in a still smaller nutshell than the one which contains the argument itself. Languages are organisms, says Schleicher; but languages are not organisms except by a figure of speech, and a moment's attention to this fact would have saved the professor all his labor. With Professor Müller—a writer who, by the tone of his writings and their matter also, often inevitably calls it to the mind of his observers that he is a German professor *in partibus*—Professor Whitney deals with equal effect but necessarily at greater length. He remarks, on beginning, that "it is never entirely easy to reduce to a skeleton of logical sequence and statement a discussion as carried on by Müller, because he is careless of logical sequence and connection, preferring to pour himself out, as it were, over his subject in a gush of genial assertion and interesting illustration." The reader will find this essay worth studying, as much for its method of handling as for what is said.

The other principal literary matter of the *Review* is the essay by Mr. T. S. Perry on Julian Schmidt's critical history of French literature since 1774. Schmidt's standard, and his way of applying it, the essay illustrates by giving us judicious extracts, and by comments which also seem to us judicious and sound. Mr. Perry is, on the whole, inclined to agree with Schmidt that the French tact of style is purchased at the expense of more important matters; is too much sought for and too much admired by such foreigners as profess admiration for it. But, he adds, Mr. Schmidt might have indicated its merits more clearly. The fact seems to be that Mr. Schmidt is morally angry with it, and does not well see why a good style should be, nor indeed how a style truly good can be, dissociated from excellence of matter. Probably it will always be inevitable that the Teutonic critic, when he gets at work on authors of the magnitude of the Victor Hugos and the Châteaubriands and Lamartines, shall think of them not so much as writers with a style, but as men who stand for certain thoughts, feelings, and faiths, by the righteousness and truth of which, and not by deftness or beauty of verbiage and method, they must stand or fall. This sort of incapacity of his, if that is the name to give it, after all only points once more to the old quarrel between that temperament and cast of mind which longs for the origin and meaning of things and the sources of life and that other turn of mind which delights in the beauty of existence. This seems to be, in a way, a true distinction between the genius of the two races; but the intensely practical side of the character of the Teutonic race in its various families frequently blinds us to the lofty side of its character.

We need not say more of the article by Mr. Charles Francis Adams, jr., than that after a dozen introductory pages it displays to the reader, with a very brief running comment, a collection of gems from the speeches of the inflationists in House and Senate during the session just closed. It is almost incredible the figure made by the speakers on the majority side—Bogy, Kelley, Cameron, Boutwell, Merriam of New York, Ferry of Michigan, Butler of Massachusetts, Gordon of Georgia, Holman and Bright of Indiana, Sprague of Rhode Island, Logan, Oglesby, Morton, Bundy of Ohio, and a score or two of others. However, the reader's respect for the honesty of most of the speakers will be increased, so obviously are they as innocent as field-hands of the first idea of the subject on which they are talking. Not so in every case, however. Mr. Morton is shown here as having been repeatedly driven to the wall by the use of extracts from old speeches of his which were all that could be desired. When driven there, his stock reply seems to have been that he knew now where it was that his opponents got their arguments; or that it was only dead men who did not change their opinions. He has evidently played an entirely unprincipled part, with an eye single towards his own personal aggrandizement, and much good he will probably find that he has done himself.

The book-notices are largely reviews of historical works, but all are very good, and some of remarkable excellence.

Geschichte der deutschen Kaiserzeit. Von Wilhelm v. Giesebrecht Vierter Band. Staufer und Welfen. Erste Abtheilung. (Braunschweig:

C. A. Schwetschke und Sohn. New York: L. W. Schmidt.)—No historical publication of the past year is of more intrinsic value and importance than the continuation of Von Giesebrecht's great history of the Imperial period of Germany—a period which is explained to extend from the foundation of the German monarchy by the rulers of the Saxon house to the death of Frederick II. in 1250, after which the title of emperor was practically suspended for nearly a century. It was in the hope and expectation of a new and more glorious career for united Germany than that which came to so disastrous a close in the Great Interregnum, that the historian began his work twenty years ago. Now, in the full enjoyment of a union and glory of his native country which he can hardly have dared hope to live to behold, he enters upon the most varied and romantic, and, at the same time, the saddest portion of his task. The present instalment covers in general the interval between the Franconian and Swabian lines of emperors—the reign of Lothair II. with the early years of Conrad III. This is a period of less exciting interest than either that of Henry IV., which came before, or of Frederic Barbarossa, which came after; and yet it is not without its marked character and special importance as the period in which were shaped the great interests and rivalries which racked Germany with internal convulsions for more than a hundred years. The great contest of Staufer and Welf was foreshadowed even earlier than this time; it received its decisive settlement—so far as the two houses were themselves concerned—in the downfall of Henry the Lion, 1180, pronounced by Sohm a decisive event in the constitutional history of Germany. But the family rivalry still lived on in Philip of Swabia and Otto IV., in Alfonso of Castile and William of Holland; and the family names lived on long after in the party-cries of Ghibelin and Guelf.

One famous stage of this great contest is narrated in these pages—that of Henry the Proud, the most powerful prince who aspired to the Imperial throne between Charles the Great and Charles V., who boasted, hardly with an exaggeration, that his personal dominions extended from the Baltic to the Tyrrhenian Sea. With this enormous dynastic power and his unquestioned abilities and unbounded ambition, it seems that, if he had gained the royalty besides, he might have knit together again the loosened bonds of the empire, and resisted the disintegrating tendencies which were hurrying it to its ruin. Even without this, it was only his untimely death, at the age of thirty-five, that secured the succession of Conrad, and made the third great German dynasty to be Hohenstaufen rather than Welf. It is of the siege of Weinberg, in 1140, in this contest (after the death of Henry), that two romantic stories are told. The one is that the women of the town being permitted, on its surrender, to carry away each some one precious possession, all appeared at the gates with husbands, sons, and fathers upon their backs; the authenticity of this the historian leaves undecided, as not improbable, but still not sufficiently vouched. The other, that the war-cries of *Waibling* and *Welf* were first heard on this occasion, he rejects.

The Emperor Lothair is the hero of this volume, and he is evidently a favorite character with the historian, who relates with enthusiasm his military exploits and sagacious statesmanship, even if he somewhat exaggerates the latter. It is customary to look upon Lothair as an ally of the church, and his reign as a period of reaction between the two great contests of popes and emperors. Herr von Giesebrecht shows that this was not the case. There was a lull in the great struggle, and Lothair cannot be fully identified with either party. It is true he was elected by the influence of the church, and was the main support of Innocent II. in the Papal schism; but this was simply a transaction between two parties in the church, not depending upon relations towards the church. It cannot be denied, however, that Lothair did not make the most of this opportunity of strengthening the Imperial power. On the other hand, it is shown that Conrad, from the weakness of his position and the doubtfulness of his election, was far more disposed to buy the support of the church by a submissive demeanor. This is no more than might be expected from the nature of things, and from our knowledge of the remarkable vacillations in the policy of the church two generations later—in the contests between the Welf Otto IV. and the Staufer Philip and Frederic II. The Staufer as a family (except the free-thinking Frederic II.) were no more anti-church in sentiment than the Welf; but whichever occupied the throne was by the force of circumstances brought into hostile relations with the Papacy, which aimed to use the rival house as its tool.

Herr von Giesebrecht's qualities as an historian are of the highest order. He possesses in full measure the characteristic German erudition, but without a touch of what is sometimes regarded as the equally characteristic German dulness. The narrative is marked by vigor, animation, and a peculiarly vivid individualization of the characters introduced, while the comments upon events are equally calm, impartial, and sagacious. Perhaps the reader who is not familiar with the wealth of materials in the shape of epistolary correspondence and other documents of this nature, is most struck with the distinctness with which the men and women of this far-distant epoch are brought before him as living persons, not the mere counters of chroniclers or of historical speculation. King Lothair himself, his son-in-law, Henry the Proud, the two brothers, Conrad and Frederic of Hohenstaufen, Pope Innocent II., King Roger of Sicily, St. Bernard, and a host of less prominent characters, are delineated with as much reality as if they were now living.

The notes and authorities are, according to the practice of the author, separated from the text, and will be given at the end of the next "Abtheilung," which may be expected shortly.

RECENT GOVERNMENT PUBLICATIONS.

United States Commission of Fish and Fisheries. Part I. Report on the Condition of the Sea Fisheries of the South Coast of New England in 1871 and 1872. By Spencer F. Baird, Commissioner. With Supplementary Papers. Washington: Government Printing Office. 1873. Pp. iv.-852, with 40 plates and one map.

In view of an alleged decrease of the food-fishes on the coast and in the lakes of the United States, and of the importance of knowing what steps should be taken to remedy the evil if the facts prove to be as stated, Congress, in the winter of 1871, passed a law providing for the appointment by the President of a commissioner, to serve without salary, whose duty it should be to take up the subject and report upon it in due season. Professor Baird, Assistant Secretary of the Smithsonian Institution, was chosen for this service, and entered upon the work in the summer of 1871, selecting Wood's Hole, Mass., a point between Buzzard's Bay and Vineyard Sound, as the centre of operations, in consequence of the assertion that the greatest decrease was to be found in Buzzard's Bay, Vineyard Sound, and Narragansett Bay. With a corps of competent assistants and the necessary apparatus and equipment, furnished by a Congressional appropriation, and by the assistance of the Secretaries of the Navy and the Treasury, the labor was carried on; and we have the result in a volume the title of which we have given above.

According to this Report, the facts of the alleged decrease were substantiated, and measures were suggested for remedying it. It was found that the most important fishes on the coast come in to the shores from the deep sea in the spring for the purpose of spawning, and that if this function be allowed to go on undisturbed there would probably be no decrease. The principal measure of protection recommended was the establishment of a close time of one or two days in each week during the spawning season, if not an absolute prohibition of capture during the critical two or three weeks. The researches of the commission involved a careful enquiry into the general character of the ocean, its temperature, currents, the sea-bed, the distribution of animal life on the bottom and throughout the water, and all other questions connected with the physical and natural history of the deep seas and their inhabitants. With the assistance of eminent specialists, and particularly of Prof. A. E. Verrill of New Haven, these points were carefully considered and very large collections made. Of these, we are informed that full series have been preserved for the National Museum at Washington, and that the duplicates have been or will be made up into sets for distribution to various scientific institutions throughout the country.

In addition to the Report of the Commissioner, we have in the present volume a large body of testimony taken in reference to the general subject of the fisheries; arguments on both sides as to the question of protection or non-protection; citations of European authorities on the same general subject; notices in regard to the abundance of fish in former times on the New England coast; statistics relating to the fisheries on the south shore of New England; the natural history of some of the more important food-fishes on the coast, such as the scup and the blue-fish; descriptions and figures of the apparatus used in the capture of fishes on the sea-coast and lakes of the United States; a list of the patents granted in the United States, up to 1872, in reference to the capture and utilization of fish; a report on the invertebrate animals of Vineyard Sound, by Prof. Verrill; a list of the sea-weeds of the south coast of New England, by Dr. Farlow; a catalogue of the fishes of the east coast of North America, by Prof. Gill; a list of the fishes collected at Wood's Hole; and other articles. The most important among the titles just enumerated is the paper by Prof. Verrill, which alone occupies nearly 500 pages of the volume. The list of fishes by Prof. Gill includes all the species of the east coast of North America, with both their scientific and common names, and an indication of their geographical distribution. The illustrations consist of the many devices for the capture of fish, such as pounds, traps, nets, etc., and 287 figures of marine invertebrates, most of them from original drawings. There is also a large map of the region explored, upon which are plotted the positions of the fish pounds and traps, the lines traversed by the dredges and trawls, the temperatures at the surface and bottom of the water, and many other interesting facts.

Forty-third Congress; First Session; House of Representatives; Miscellaneous Document No. 235; Appropriation for Preservation of Food Fishes; Letter of the United States Commissioner of Fish and Fisheries, asking a Deficiency Appropriation for the fiscal year ending June 30, 1874. April 1, 1874, referred to the Committee on Appropriations, and ordered to be printed.

In this pamphlet of eight pages the United States Commissioner gives an account of the work accomplished by him in introducing young shad and salmon into the rivers and lakes of the United States in 1873; the number of the former, according to his account, amounting to over a million and a half, and of the latter to about a million three hundred thousand. The Commissioner appears sanguine of ultimate success in the measures he has undertaken, and thinks that, with a moderate expense, the numbers of the valuable food-fishes referred to can be very greatly increased in the United States, not only multiplying their numbers in the waters which they have hitherto inhabited, but making them abundant in streams where they have never before been known.

Topographical Atlas, projected to illustrate Exp'orations and Survey West of the One Hundredth Meridian, and prosecuted in accordance with the Act of Congress under the direction of Hon. W. W. Belknap, Secretary of War, by the Corps of Engineers; projected by General A. A. Humphreys, Chief Engineer; embracing the result of the different Expeditions under Lieutenant George M. Wheeler, Corps of Engineers.

Some time ago, Lieut. Wheeler presented to the Chief of Engineers the plan of a systematic survey west of the hundredth meridian, dividing it into sections of sixteen to eighteen thousand square miles, such of them, however, as were on the borders of the United States being fractional and of less dimensions. The whole number of proposed sections amounts to ninety-five, of which the longest line consists of thirteen, along the one hundredth meridian; nine, again, occupy the width of the area in question, on the forty-ninth parallel from the one hundredth meridian to the Pacific Ocean. The amount of work actually accomplished in the several sections is indicated by Lieut. Wheeler; the object being a systematic survey of the region, each section to be represented by a special map, and the whole intended to constitute a complete topographical atlas of Western North America. In the present work we have the first number of the proposed atlas, embracing six sheets; the first reproducing the sketch-map, with its ninety-five subdivisions already referred to, and showing the routes of exploration on the part of the expeditions of the War Department; the second being a map of the areas of drainage to the Atlantic and Pacific Oceans, and of the interior basins of the United States; while, in the remainder of the atlas, we have the details of sections 50, 58, 59, and 66, given on the scale of one inch to eight miles, each covering a little more than a degree and a half of latitude, and nearly three degrees in longitude. It is on a sufficiently large scale to exhibit most of the physical features in considerable detail, although not equal in this respect to Mr. King's maps, which have four inches to the mile. As embracing the result of the surveys on the part of Lieutenant Wheeler, the work, when finished, cannot fail to add much to our knowledge of the physical geography of the country. We notice a considerable want of clearness in the details of execution of the maps, especially in the lettering, but this is probably inseparable from the method of their execution, which is apparently from photolithographic reductions from the manuscript sheets. A more important defect is the small number of mountain elevations laid down from which to form an idea of the comparative elevations. Both shortcomings will doubtless be remedied when the maps are actually engraved and additional explorations prosecuted; if, indeed, the missing data be not already in the note-books of the office.

Harper & Bros.' Summer Book-List.

By J. LOTHROP MOTLEY.

THE LIFE AND DEATH OF JOHN of Barneveld, Advocate of Holland. With a View of the Primary Causes and Movements of "The Thirty Years' War." By John Lothrop Motley, D.C.L., Author of 'The Rise of the Dutch Republic,' 'History of the United Netherlands,' etc. With Illustrations. In two volumes. 8vo, cloth, $7. (Uniform with Motley's 'Dutch Republic' and 'United Netherlands.')

By Dr. SCHWEINFURTH.

THE HEART OF AFRICA; or, Three Years' Travels and Adventures in the Unexplored Regions of the Centre of Africa. From 1868 to 1871. By Dr. Georg Schweinfurth. Translated by Ellen E. Frewer. With an Introduction by Winwood Reade. Illustrated by about 130 Woodcuts from Drawings made by the Author, and with Two Maps. 2 vols. 8vo, cloth, $8.

By H. M. STANLEY.

COOMASSIE AND MAGDALA: a Story of Two British Campaigns in Africa. By Henry M. Stanley. With Maps and Illustrations. 8vo, cloth, $3 50.

By S. IRENÆUS PRIME.

UNDER THE TREES. By Samuel Irenæus Prime. Crown 8vo, cloth, $2.

By W. P. FETRIDGE.

HARPER'S HAND-BOOK FOR TRAVELLERS in Europe and the East: being a Guide through Great Britain and Ireland, France, Belgium, Holland, Germany, Italy, Egypt, Syria, Turkey, Greece, Switzerland, Tyrol, Denmark, Norway, Sweden, Russia, and Spain. With over One Hundred Maps and Plans of Cities. By W. Pembroke Fetridge, Author of 'Harper's Phrase-Book,' and 'History of the Rise and Fall of the Paris Commune.' In three volumes. 12mo, full leather, pocket-book form, $3 per vol. (*the vols. sold separately*); or, the three vols. in one, similar binding, $7.

EVANGELICAL ALLIANCE CONFERENCE, 1873.

HISTORY, ESSAYS, ORATIONS, and Other Documents of the Sixth General Conference of the Evangelical Alliance, held in New York, October 2–12, 1873. Edited by Rev. Philip Schaff, D.D., and Rev. S. Irenæus Prime, D.D. With Portraits of Rev. Messrs. Pronier, Carrasco, and Cook, recently deceased. 8vo, cloth, nearly 800 pages, $6; sheep, $7; half calf, $8 50.

By CHARLES NORDHOFF.

NORTHERN CALIFORNIA and the Sandwich Islands. By Charles Nordhoff, Author of 'California: for Health, Pleasure, and Residence,' etc., etc. Profusely Illustrated. 8vo, cloth, $2 50.

HARPER & BROTHERS, FRANKLIN SQUARE, N. Y.

THE WEEK IN TRADE AND FINANCE.

NEW YORK, July 13.

THE money market has remained very easy, with the rates ranging between 2 and 3 per cent. Commercial paper stands quoted at 6 to 7 per cent. for first-class names, while extra double-name paper having over four months to run has been placed at 5 per cent.

The bank statement on Saturday last showed important changes, and was a favorable one—the net surplus reserve having increased $2,595,675 during the week. The large gain in specie is accounted for by the disbursements of the Treasury on account of the July interest on the public debt. The loss in legal tenders is in part accounted for by the recent shipments to Washington by the banks, for the purpose of complying with the requirements of the recently-passed currency law, but there are some indications that an attempt at "locking up" has been made by parties interested in depressing the stock market. The following is a comparison of the averages of the past two weeks:

	July 3	July 11.		Differences.
Loans	$287,422,200	$287,088,400	Dec..	$333,800
Specie	21,934,300	27,375,400	Inc...	5,441,100
Legal tenders	63,660,500	61,335,100	Dec..	2,325,400
Deposits	241,445,500	243,525,600	Inc...	2,080,100
Circulation	25,863,900	25 923,700	Inc...	59,800

The following shows the relation between the total reserve and the total liabilities:

	July 3.	July 11.		Differences.
Specie	$21,934,300	$27,375,400	Inc..	$5,441.100
Legal tenders	63,660,500	61,335,100	Dec..	2,325,400
Total reserve	$85,594,800	$88 710.500	Inc..	$3,115,700
Reserve required against deposits	60 361,375	60,881,400		
Excess of reserve above legal requirem'ts.	25,233 425	27,829,100	Inc...	2,595,675

Gold has drooped since the large disbursements of July interest, and has been very steady for the past two or three days at 109¾ to 110. Large amounts of exchange making against shipments of produce, with lighter purchases in foreign markets, account for the estimate put upon the gold premium by international traders.

Nothing positive has transpired in regard to the offers which are supposed to have called out the circular invitation of Secretary Bristow for the remainder of the five per cents. Government bonds have been firm at the lower prices; the five per cents being fully one per cent. above their par, in gold, here and in London.

The following are the latest quotations:

Railroad bonds have been quiet, at prices generally up to last week. The Pacific issues, as well as some other large mortgages, have suffered a trifling decline. The amount of this class of investments offering is in excess of the saving power of our people to absorb; but as little new paper of the kind is making, a gradual improvement may be looked for.

Railroad shares have been up and down during the week, the Western stocks being among the sufferers. Although the action of the courts in regard to the hostile legislation contains no new or sudden departure from the well-settled proceedings in like cases, the slightest circumstance is used in Wall Street to depress prices. Rock Island, Northwestern, St. Paul, even Chicago, Burlington and Quincy, have been disturbed. Erie is reported stronger on the knowledge of what took place at the election to-day. The new board of direction is said to foreshadow a unity of purpose between the Pennsylvania and Erie interests, and, if so, will be a gain of strength to both.

The following shows the highest and lowest sales of the leading stocks at the Stock Exchange for the week ending Saturday, July 11, 1874:

The Nation.

NEW YORK, THURSDAY, JULY 23, 1874.

The Week.

CHICAGO has had another fire of the first order. The last time she is supposed to have lost $200,000,000; this time she is supposed to have got off for less than $5,000,000, and the insurance companies have suffered very slightly, the burnt quarter having consisted mainly of small wooden houses. But few valuable buildings were destroyed. Among these were the Post-office, a large hotel, and some churches. Mr. White of the Chicago *Tribune*, we are sorry to say, lost his house; in the first fire he lost his office also. Mr. Scammon of the *Inter-Ocean* also lost his house, and with it one of the most valuable libraries in the West, which has caused genuine regret; though, judging from the articles in his paper on the currency, his books do not seem to do him much good. The origin of the fire as usual is obscure, but this much is certain, that it originated in a wooden shanty, and through wooden shanties it was spread. The stupendous folly of allowing wooden buildings to be put up in close contact with stone in a large city would seem to be self-evident, and yet it has taken two big fires to convince the Chicago public of the fact. Happily, nearly all of those burnt on the present occasion were what are called rookeries, that is, squalid nests of dirt and disease, the destruction of which by the "devouring element" is a sanitary gain. As usual, the Fire Department comes in for a fair share of abuse, but we are unable to say with what justice. The accounts seem to agree, however, that a great deal of time was lost in trying to save the "rookeries" in which the flames first broke out which would have been better spent in isolating them, and that there was too great hesitation in bringing up the whole force of the Fire Department. It seems to be one axiom of the art of fire extinction that too much water cannot be poured upon the very first blaze, and that it cannot be poured too quickly, and another that no fire can safely be called small.

The Beecher-Tilton investigation is going on steadily, closely watched from the streets by the reporters, who, however, really have nothing to tell, and refrain, with somewhat remarkable self-denial, from rumors and conjectures. They have got Tilton, however, under a surveillance which no detective force could surpass, and which the secret police of the European despots would envy. His door seems to be watched with lynx-eyed vigilance. The departure of some trunks from it last week excited suspicions that he was about to attempt to fly to Europe or some island of the sea, but results must have shown him its hopelessness. On Monday evening the Committee sat at the house of one of the members in Brooklyn, and the door was guarded by representatives of the press until far on into the night in torrents of rain, but they had to acknowledge sorrowfully that they learned nothing. The basis of the few speculations in which they indulged was exceedingly slender, consisting simply of Tilton's appearance when he entered the house and when he left it, and one little peep into the room before the shades were pulled down. Going in, he seemed bowed down with care, while coming out he seemed light-hearted and joyous. Being asked his opinion of his own statement before the Committee, he modestly pronounced it "unanswerable." It has since been published, and although it is, pending Mr. Beecher's reply, hardly a fit subject for comment, it will have to be met with the utmost candor and straightforwardness.

The Indiana Democratic Convention, much waited for as being Mr. Hendricks's, begins its platform with a long black-list of Republican misdemeanors and crimes, among which we observe, for a new one, the latest topic of all, namely, the Poland-Harrington press "gag-law," a matter which still calls on Mr. Poland for an explanation of his bad faith or of his simple facility in the hands of the District Government. Another matter of interest was not so fresh: this was the cheap-transportation question. But it was spoken of rather vaguely, and no definite policy was laid down:

"*Resolved*, That railroads and all other corporations created for gain or profit should be rendered subservient to the public good, and that we demand such legislation on this subject, both State and National, as will effectually secure the industrial and producing interests of the country against all forms of corporate monopoly and exaction."

On the currency question the voice was twofold, and Governor Hendricks, in one important part of his address, devoted himself to showing that paper-money is not "the currency of the world," thus contradicting the Hon. Mr. Bundy of Ohio, who said in the House last winter that he saw some a year ago as far off as Vienna, an Austrian city. Mr. Hendricks deprecates, rather gently, the existence side by side at the same moment of two mediums of exchange; but the remedy he deems it advisable to propose just at the present time is that, as we shall by-and-by increase our products, and make our paper dollars worth as much as gold, we perhaps had best wait.

Most of the rest of the platform is Indianian rather than national, and appears to be well planned for effect within the State. One plank, however, is more general. It roundly denounces the Civil Rights Bill; and, while wishing all manner of educational and other good to the negro, it wants to know what the voters of Indiana think of an attempt to force negro equality upon the whites by giving to the Federal Government an abhorrent power of interference in the management of graveyards, schools, churches, hotels, theatres, and so forth. The condemnation of Senators Morton and Pratt for their action on the bill is demanded, and doubtless this is by no means so empty a call in Indiana as it would be in many other States. Then follow impeachments of the Republicans for raising the State taxes from five cents on the hundred dollars to fifteen; for allowing their officials to embezzle by using public money as their own; and for supporting an extravagance which keeps county, State, and National taxes higher than they should be by at least fifty per cent. Another issue is the liquor question, the Democrats promising a repeal of the Baxter Prohibition Law and a return to a license system—the license money to be turned over to the school fund. That every weapon is to be used in this contest and no resource neglected is further evident from the fact that two of the candidates are taken from the Independent or Farmers' ticket, of whom one is a Liberal Republican of some influence. The Convention was enthusiastic and disorderly, and the candidates for nominations eager, which is thought to shed light on the probability of their getting their elections when once they have made sure of their nominations. But this many journals will not believe.

The Indiana Democrats appear on the surface to have given displeasure to many outside Democrats and to have correspondingly pleased the infidel and the alien. They avowed, for instance, that they thought paying the bonds in greenbacks to be no more than what justice requires, and thus revived the Pendletonism of six years ago—a proceeding which nobody at the East approves, no matter of what party. But with that squint to leeward which all Western conventions now give when these financial breakers come in sight, the convention in the same breath resolved that it was in favor of a return to specie payments as soon as possible; though, still, it thought that meantime there should be a judicious, not too hasty, regulation of the volume of the currency, and that the demands of business should always be regarded. The manner of all this portion of the platform, as well as the manner and substance of all the rest of it, seems to show that both the pleasure and the displeasure of which we have spoken have probably been indulged with-

out necessity. Indiana is the home of Senator Morton, who has certain relations to the Presidency, and also of Governor Hendricks, whom the Democrats may probably push forward as a candidate for that position. Often has the State been the scene of the contests of these two capable leaders. Only two years ago no stone was left unturned by either party, the one seeking to return Morton to the Senate, the other to secure the governorship as a *pou sto* for Mr. Hendricks. It may be said that both succeeded, for Morton secured his legislature, and Hendricks the governorship. It therefore happens this year, as we understand matters, that national questions are dealt with by the Democrats much as the Republicans dealt with them the other day—that is, everything said in platform and speech is said with a view to this autumn's State campaign (when only minor officers are to be elected), and, of course, with a view also to Morton's prestige and to Hendricks's in 1876. It is mainly a State affair; and we suspect much of the current comment is wasted on a platform the inexpedient features of which may well be withdrawn by the year after next, if such be the will of the National Convention; and to this end Governor Hendricks's careful speech seems to point with sufficient distinctness. We may add that, considering the Morton Convention's financial utterances, the Republican press has some impudence to fling mud at those of Governor Hendricks's Convention.

The willingness of the Southern people to accept leaders and obey them has been a fact much lost sight of, probably because the outside world knew the South better by its leaders than by its population in general, and, indeed, this population was hardly known to the outside world at all, and is not yet. What the Northerner or European was accustomed to see in the Southerner as he showed in Washington was a naturally high-spirited man, accustomed to the independent expression of his opinions, free in act as well as speech, and in general well equipped with all that important class of the gentlemanly qualities which are related to courage and self-assertion. As a rule, he was badly off as regards some of the other indispensable qualities, but of these a certain number of Southerners had a full supply. But leaders of this sort argue a submissive rank and file, and it is no wonder that, since the war, the Southerner should have often surprised the Northerner by indications of a fondness for personal rule, and, as many officials can testify, for Federal protection and government—provided, of course, that the Federal arm was not to be too much extended for the advantage of the negro. And the habit of leadership, no less than the habit of obedience, has made it natural for these old-time commanders, as well as for their followers, to look for relief above them rather than around them—to a society organized on a different plan than that underlying our Northern communities. Dislike of the successful side in the late war, and dislike of the patronage accorded to the negro, have come in to modify and repress this feeling, but it has an existence, and it is not surprising that, of the really serious talk about a third term for General Grant, pretty much all has come from the South. We have no doubt that both the officious Colonel Mosby and his correspondent, Governor Kemper, will in good time get their quietus from their fellow-Virginians; but there is not a Northern community where anybody but night-editors would waste so much ink on such a subject as these two politicians have shed. The last man out on the same side is a Louisianian—an ex-Governor—Mr. Hebert, who also is strong for a third term, but the newspaper men have discovered that he has recently been made a Commissioner of Levees at five thousand a year, and they suspect his motives to be of what is called a mixed character. We may safely make the general supposition that the subject has now no longer a breath of life in it.

We have intelligence from an exceedingly trustworthy source as to the state of affairs in Arkansas, and it is in substance this, the first part of which our readers already know: Baxter was in 1872 the nominee of the Clayton-Dorsey Ring, and was "counted in" by them fraudulently, while Brooks, the anti-ring candidate, really had a majority of votes. Baxter, however, soon showed that he would not serve the ring, and in other words, to use their own slang, "went back on them." They then turned about and took up Brooks, and instigated him to oust Baxter by armed force, but the people of the State and the Legislature, who promptly recognized the real state of the case, sided with Baxter. The Legislature, as soon as Brooks was disposed of, then made arrangements to enable the people to get rid of the infamous constitution fastened on them by the ring at the close of the war, and ordered a vote to be taken both for and against a constitutional convention, and, if the result was affirmative, provided for the election of delegates. The Brooksites opposed this vehemently, both because, if carried, it would be a recognition of the legality of the Legislature which recognized Baxter, and because it would finally take the State out of their hands. The election has taken place, however, has been unprecedentedly fair, and has resulted in a vote of 88,886, out of a voting population of 100,000, for the convention, and the delegates elected are, our correspondent says, "the most substantial citizens of the State. To-day," he adds (July 14), "the convention has met. I have mingled with them as they have been coming in for the past few days. I find them to be extremely conservative, and to be of one mind to try and adopt a constitution for the whole people. They seek no proscription of any man on account of his previous political associations. The great desire seems to be to build up the State."

The "Universal Alliance" is the name of a body made up of representatives of various nations, which is intended to promote international humanity by means of diplomatic and other action, and especially to mitigate the horrors of war, by providing for the better treatment of prisoners and wounded, and the restriction of military power over non-combatants. It has succeeded in obtaining the recognition and patronage of the Emperor of Russia, and is going to hold a Conference at Brussels under his auspices, to which all the governments have agreed to send delegates. The programme of the proceedings on that occasion includes 147 articles or propositions which the delegates are to debate, and, if approved, propose for the adoption of the various governments. Some of these articles, which involve very important modifications in international law, have, it is said, been already approved if not suggested by Prince Gortchakoff. The Earl of Denbigh has called attention to two of them in particular in the House of Lords, and, apropos of them, has obtained from the Earl of Derby an announcement that the British Government will send a delegate to the Conference to report simply, and without power to agree to anything, and will refuse to enter into any discussion of the rules of international law, and will protest against any extension of the scope of the Conference so as to include matters relative to maritime operations or to naval warfare. The articles which have led to this disavowal call for the establishment of "the principle that the armed force of one state only fights against the armed force of another state, and does not consider as an enemy the peaceable citizen who is not equipped as a soldier," and "of the principle that in territories occupied by the enemy the army of occupation alone is to be considered as possessing legal authority." The objections to these "principles" are too numerous to be even hinted at in a paragraph, and at any rate it is hardly worth while discussing them as yet.

The only incident of note in English politics is the formal introduction of the "Home Rule" movement by Mr. Butt, an elderly gentleman, who has been for thirty years a prominent member of the Irish bar, but has been devoting himself of late years to politics, in which his success is considerably impeded by the defects in his personal character. "Home Rule" is a kind of modification of "Repeal," and means simply the relegation of purely Irish questions to an Irish legislature sitting in Dublin, leaving the legislative union still intact as regards Imperial, or, as we should say, Federal questions. Mr. Butt is about the only man of any mark, however, who advocates the scheme, and he is a Protestant and a "Saxon." Even The O'Donoghue spoke and voted against it on the present occasion, and it only got 61 votes against 458, Mr. Disraeli closing

the debate in a speech of considerable power, in which, replying to Mr. Butt's charge that Irishmen were unfairly treated in the distribution of high offices, he said he had known three prime ministers and three viceroys of India who were Irishmen, and that the present Lord Chancellor was an Irishman. He might have added that the present Governor-General of Canada is an Irishman, and that the latest recipient of high military honors, Sir Garnet Wolseley, is an Irishman, and that only a very few years since five out of the twelve English judges were Irishmen. In fact, if there be any unfairness in the matter, it is Englishmen and Scotchmen who have a right to complain of it. Considerable laughter was caused in the course of the debate by Mr. Butt's statement that the Irish press was not free, and there are probably few readers of the Irish papers of the "Home Rule" party who could if present have refrained from joining in it. The real difficulty in the way of Home Rule is that hardly anybody in Ireland who has anything to lose would contemplate it without a shudder. As the "national party" in our day is entirely wanting in the elements of intelligence and respectability which gave a certain dignity and promise to the "United Irishmen" organization at the close of the last century, and even gave some elevation to the Repeal agitation, the triumph of the present movement would probably result in the production of a legislature in Dublin of which the New York Common Council of late years might furnish a fair idea, and whose main occupation would be the "striking" of property-holders. The leader of the lower House, at least, would certainly not be a gentleman, like Grattan or Flood, or even like O'Connell or Smith O'Brien, with self-respect enough to refrain from the grosser kinds of peculation, but probably a common "boss," like Tweed or Shepherd, armed with a "rake" and a "slate," fond of good living and fine furniture, and indifferent to reputation.

Russia and Austria have just come together in a curious way, by a visit from the Archduke Constantine to Vienna to bestow on the Emperor the military Order of St. George, in remembrance, the letter of announcement said, of the alliance between the Austrian and Russian armies in 1849. As the one military result of this alliance was the battle of Raab, which crushed the Hungarian insurrection after it had effectually overthrown the Austrian armies, and brought about the subjugation of the country during the ensuing fifteen years, it was at first feared that this performance would be taken as insulting by the revived Hungarian kingdom, and place Francis Joseph in an unfortunate position. But the Hungarians, who are among the most practical politicians of the world, and never groan over the past, took the affair in perfect good humor, feeling perhaps, and quite correctly, that whatever humiliation there was in the battle of Raab fell to the lot of Austria herself, and that those may laugh who win. Moreover, Count Andrássy, who had to fly after 1849, was present at the banquet in the Hónved uniform, in which he fought against the allied armies in that year, which well marked the triumph of the national cause and showed what time had done to remove bitterness. About the same time Count Beust, as Austrian Ambassador in London, presided at the annual dinner of the Hungarian Society of that city, founded years ago for the relief of Hungarian refugees driven from home by political troubles. It is not so very long since the Austrian Minister looked on the society as a collection of criminals, on whom he would have been glad to lay hands. A little more significance was attached to the Russian visit at first than it would otherwise have had, owing to its coincidence with changes in the administration of the army. Since the adoption of the constitutional system, the army has been in the hands of the Minister of War, and the crown has had only formal connection with it through an Inspector-General, the Archduke Albert, who, however, had really no duties. The late Minister of War, Baron Kuhn, has now resigned, and his successor, Holler, finds himself outranked by Baron John, his senior in the service, who has been appointed to the revived office of "Chief of the Staff," answering to that held by General Von Moltke in Germany, and will probably now exercise the active control of the army under the direct orders of the Emperor. This was at first treated by the press as a political move, but it is now plain that it has no political significance, and is simply due to a desire to carry out a new scheme of army reorganization on the French model.

The French Ministry, in spite of its Prussian character, has been passing through a crisis. M. Magne's proposal to increase the salt tax was defeated on Wednesday week by a majority of 106. Then a reluctance, real or supposed, on the part of M. Fourtou, the Minister of the Interior, to permit the prosecution of M. Rouher (against whom there is all but proof positive that he had allowed his house to be used as the headquarters of a Bonapartist organization, of which he was the principal member), and differences regarding the organization of the Government, led to his resignation, and plainly, although the Cable makes no mention of it, to that of M. Magne, the Minister of Finance also, thus leaving the Cabinet without Bonapartists. The Duc de Broglie is said to have then endeavored to recast it altogether, but failed, and the two vacant places were filled by M. Chabaud-Latour and M. Mathieu Bodet, both, we believe, Orleanists. General de Cissey, the Minister of War, then announced that he had nothing new to say, inasmuch as the Cabinet as reconstituted had not had time to agree on anything. The debate on the Constitutional Bill was postponed until to-day, but it is thought probable that Périer's plan will be rejected, and that, after voting the appropriations, the Assembly will adjourn for the summer. The only progress made towards anything permanent or definite has been derived from the Marshal's declaration that for seven years he will not allow himself to be ousted. But he is performing an invaluable service to France in keeping the peace while the rival factions get used to the work of parliamentary government. Paul de Cassagnac has been acquitted on the charge of exciting citizens to hatred and contempt of each other. In reply to his own blackguard abuse of the Radicals, he read at the trial some of their blackguard abuse of the Bonapartists, and it would be hard to choose between them. But anything duller or more stupid it would be difficult to find. The fights between our own *Times* and Murtagh or Hugh Hastings are lively in comparison. The articles on both sides consist mainly of exhortations to the police to look after the other fellows for various specified reasons.

The Indian famine, from which so much was feared, has apparently proved not to be so very terrible after all, and though some of its consequences are likely to prove very important, they are not the consequences that were looked for. The *Economist*, brushing aside the sentimentalist accounts of it, goes boldly to the revenue returns as likely to furnish the surest indication of what it has amounted to, and finds that the yield of the various taxes has diminished very slightly—the land tax, for instance, only 1·6 per cent. It finds, moreover, that the estimates for the coming year, which are drawn by men who know what they are talking about, not only do not calculate on a farther decline, but look for a positive increase. More remarkable still, the decrease in several important items is attributable to agencies which have no connection with the famine. In short, it is plain that, although $52,500,000 have been spent in relief, the extent and intensity of the famine have been greatly exaggerated. In fact, under the old native *régime* it would probably not have been called a famine at all. But then it has brought to light, the *Economist* thinks, two other things of considerable importance. One is that the pressure of population on subsistence under the security of British rule is becoming very great, and is alarmingly great when we consider that the means of subsistence lies in a single crop which may any year fail, and that the population is already in Bengal very dense. Another is that the measures of relief resorted to in the present instance, and which are unparalleled in Indian history, will probably satisfy the people that the Government is sure to take care of them under all circumstances, and thus throw down the last and most powerful obstacle to improvident multiplication and improvident modes of life.

THE REPUBLICAN CHURCH.

THE full text of the address to the people of the Republican Congressional Committee has been published. The signers are mostly politicians of a not very high order, starting with Mr. John A. Logan, but the document is ingenious and perhaps effective, and is intended to influence the coming Congressional elections, and will doubtless do so. The most telling part of it is the opening, in which it compares the career of the Republican party with the preceding period of Democratic rule, and in which, as in all such comparisons, there is a great variety of curious evasions and omissions. These, however, are hardly worth notice; nor is the portion of the paper which is devoted to an enumeration of the Republican services to the nation since 1861, as it is very familiar to the public ear.

When the address proposes to the Republican voter an indefinite continuance of the confidence hitherto reposed in the party in power, it brings up again a point of a good deal of importance, which we have more than once discussed in these columns, and that is, the length to which this confidence ought to be carried. As the managers state their case, there is really no reason why the party should not continue in power for ever. What they say is, in substance, that it is quite true that there are many abuses still needing correction, but that the Republican party is sure to correct them if we give it time. But the party has now been so long in power, and has effected such sweeping changes in the Government, that a large majority of the abuses which now call for rectification are really of its own creation, or have grown up under its rule. The moiety system, the Sanborn contracts, and the "salary grab," for instance, to enumerate those of latest date, which the last Congress has swept away, were the direct result of Republican legislation. The condition of the civil service, though not Republican in its origin, has reached its present pitch of badness in Republican hands, under the enormous multiplication of the duties of the Government which has taken place under Republican rule; but the party as such gives itself no concern about it, and is apparently hostile to any change in it, and yet this abuse may be said to be the fountain of all others, and the one which most distinctly imperils the Government. The condition of the South, and its relations to the General Government, constitute another abuse of the most dangerous magnitude, and yet the Congressional Committee pass it over, as the majority in the last Congress passed it over, almost without notice. The condition of the currency is another most alarming abuse, and all the Committee have to say about it is that if the Republicans do not know how to deal with it, neither do the Democrats—which is very much as if Jones, whom you had taken to pilot you along a dangerous coast, were to confess that he knew no more about the coast than a babe unborn, but could assure you for your consolation that his rival Smith, who wanted the job, knew nothing about it either, and were to advise you to get out your lines and go codfishing. A party in power which calmly confesses in a period of suspended specie payments that it has nothing to say about the currency, and yet proposes that it shall continue in power as long as it may be necessary for it to make up its mind, really claims the status and privileges of a church. The church is a permanent institution—created for the regeneration and salvation of men—which cannot be overthrown or dispensed with, and which, though it may become corrupt or time-serving or lukewarm, nevertheless contains within itself the means of its reformation and is the one channel of grace. This is virtually the kind of position the Committee claim for the Republican party. Under their definition of it, no valid reason for putting it out of office can ever arise, because, no matter of what faults or follies it may be guilty, it can always abandon or reform them. It may, for instance, create the moiety system and breed Jaynes and Sanborns, but then, as soon as the people get angry, it can sweep the system away and dismiss Jayne and Sanborn. It may pass a salary bill, but if it finds the country is displeased it can repeal it at the next session. It might propose a measure of repudiation, as some of its leaders did in 1868, but then if it found the country was not ready for it, it might drop it.

Now, this is a delightful theory for the politicians, because it means perpetual office for them and their friends; but is it a theory which voters are really ready to sanction or adopt in a country ruled by party? Would there be under such a system any means whatever of enforcing any responsibility or of infusing any seriousness or care into legislation? If a party need never fear dismissal from power as long as it is ready to undo the mischief it has done, what check is there on its wrong-doing? Take the moiety system. It was in operation for five years; it demoralized the commercial world; it converted the custom-house into a den of fraud and extortion; it subjected the most respectable merchants to unheard-of penalties; it converted their confidential clerks into spies and informers, put their private correspondence into the hands of the lowest order of adventurers, and enabled a tribe of disreputable people to make fortunes by black-mail. Now, no party ought to dare to create such a system. A party is bound to foresee the consequences of such a system; but what party will ever take the trouble to examine such legislation carefully, and follow out its probable working, if it knows that it can get rid of the burden and odium of it by simply repealing it after the knaves have filled their pockets under it? Take again the Sanborn case. The three most important officers of the Treasury were convicted—we do not think this is too strong a word—either of the grossest negligence or of connivance at fraud. They were armed with the power they abused by a careless act of Congress. When the abuses which occurred under it were exposed, but not sooner, the Secretary of the Treasury retired; but he was forthwith put on the judicial bench for life by the appointment of the head of the party, and with the confirmation of the majority in the Senate. Now, was this a proper way to deal with such a matter? Is this a proper example to set to the servants of the Government and to the young men of the country? And are we really to have no remedy for such things except prayer that the managers may undergo a change of heart?

The validity of the claims of a party to continuance in office can only, as it seems to us, be tested by the spirit in which it deals with the real questions of the day—by which we mean not only the topics which occupy men's minds, but the prevailing tendencies of the time. Strong convictions about slavery and the national unity were valuable during and at the close of the war, but the "burning questions" since the war have been the disorder in the finances and the enormous force of civil servants created by the war. With these the Republican party has shown no disposition whatever to deal. A curious illustration of the limitation of its powers and aims exhibited in the settlement of the *Alabama* dispute with England. After that had been arranged by the Executive, and the money handed over to the majority in Congress, there was neither wisdom nor grace enough found in the body to order the distribution of even this small sum upon any recognized and established principles of law or commercial usage. The total collapse of both Houses in the presence of the currency problem was another example of the same helplessness; and indeed it would be hard to say in what question now before the people the party takes more than a perfunctory interest. It might, in spite of many errors and shortcomings, establish solid claims to popular confidence in the future if it showed any disposition to bring forward able men, and put them in the front. But more determined discouragement of talent was probably never witnessed in our history. Every new election sees the number of its ignorant brawlers increase, and also the number of its able men who retire into private life.

CITY AND COUNTRY AT THE OAR.

BEFORE every boat-race the newspapers are naturally full of comments on the crews and of speculations as to the result, and what they say in many cases furnishes a somewhat curious illustration of the way in which even the most sceptical keep little corners of their minds for faith, into which they will on no account allow positivism to enter. Every one must have observed how large a pro-

portion of the members of what is called the Radical school are very Gradgrinds on the subject of religion. They believe what they see, and see what they believe, and nothing more, and call out for "facts" in the middle of a prayer, and are full of measureless scorn for people who hold on to a creed for the sake of its consolations or associations. They have no patience with a man who believes or tries to believe because it is pleasant, or who refuses to examine the ground of his belief lest he should find it hollow. When you tell them of the support which millions have drawn from the stories and theories which men of the positivist turn denounce as myths, they ask you contemptuously whether there is any legitimate support but truth, and whether anybody but a savage ought to draw comfort from things which science shows to be the creations of poetry or thaumaturgy. Whenever we turn aside from religion to politics, however, we find the same men converted into humble, wondering, credulous worshippers, who stand with open mouths, ready for any legend, tradition, or theory, however wild or however opposed to observed facts, which seems likely to exalt any object of their admiration or to further any cause they have deeply at heart. You meet a scoffer coming away from a church-door full of sneers for the preacher or of contempt for the congregation, and evidently a sceptic of the sceptics with whom it is useless to argue, and if you are of a devout or poetic turn, you thank your stars that you are not likely to be brought much in contact with such a dry, cold, and unsympathetic and unimaginative mind. But begin to talk to him of Humanity or Woman, or the Poor Man or the Poor Boy, and the chances are ninety-nine to one that you find yourself dealing with an intellect that might have been trained by St. Francis d'Assisi or Cardinal Cullen. He is ready for almost any proposition, however monstrous; in fact, the more monstrous it is, the better he likes it. When you produce something very wonderful about the powers of ordinary human nature he swallows it calmly, and asks if you have not something a little stronger. His Garden of Eden is very much the same as that in which the Fall took place, but instead of placing it 4000 B.C. he puts it A.D. 2500, and calls it the "Golden Age." The life led by the inhabitants he makes much the same as that of Adam and Eve. There will be no work done in it except for exercise. Tillage and manufactures will be attended to by machinery, directed by pure and cultivated men and women in their hours of leisure. There will be neither poor nor rich; or rather, all will be rich, or possess the enjoyments now monopolized by the rich. There will be no judges or lawyers, or armies or navies. Nobody will be cleverer or more learned, or wiser or stronger, than anybody else. There will be banks in which everybody will have an account which cannot be overdrawn, and where he can have his note cashed without discount. Interest on money will be unknown, and stocks, instead of being bought or sold, will pass by gift. Everybody will have a university education, and will get his degree by whatever occupation best pleases him; some by hoeing potatoes, others by reading magazines, and others by running to fires and playing hockey in the streets. Corn will be carried to tide-water at five cents a bushel, and any dirty work there may be, such as cleaning sidewalks or repairing roads after freshets, will be done by fatigue parties of would-be despots and middlemen and monopolists, superintended by brilliant women.

If you venture to point out any difficulties in the way of the realization of these visions which you either draw from human experience or from observation of the working of natural laws, he incontinently denounces you as a heartless reactionary, who would shut the gates of mercy on mankind, and who has no sympathy with his fellows or faith in them; and tells you with a burst of triumph that these beliefs which you reject he means, for his part, to cherish to his last hour; that they are his support and consolation under all the sufferings and calamities of his life; that without them the world would be to him a howling waste, and the future a dark and dismal void. He treats you, in short, very much as the old lady in Providence treated the gentleman who tried to excuse the inhabitants for not going to church, by showing her that while the number was so much, there was not church accommodation for a tenth of them: "Sir," said she, "I want none of your infidel arguments."

The bearing of all this on some of the newspaper critics of the boat races is this—that they always try, in the true religious spirit, to make it appear that victory will, somehow, go to the crews least favored by worldly fortune; that is, that it is the honest country boys who had to work on the farm before they went to college, like the "Aggies" last year, or the honest mechanics who went from the workshop to college, like the Cornells this year, who will carry the day against the pampered or favored town boys of Yale and Harvard or Columbia. Nature, they think, must have a tenderness for the poor, and a desire to promote the respectability of manual labor and country life; just as the friends of woman think that Nature cannot have been so grossly unjust as to disqualify woman for any office of dignity or emolument. And yet this illusion about Nature and the country boy has been again and again dissipated by actual experience, and this experience is found to be in accordance with the soundest deductions of physiological science. The reports of our Medical Department on the late war showed, what the reports of all medical departments have shown everywhere, that the country boys are the very softest material that goes into the field; that no military contingents are sooner knocked up on the march or sooner broken down by fatigue; and that none suffers such serious diminution under the terrible process of sifting by which veterans are made. In fighting, marching, or bivouacking, or any other severe and prolonged test of the bodily powers, the city man, or man of the desk, other things being equal, comes off best, and this for a reason which, so far from being depressing, is, as regards the future of the race, in the highest degree encouraging. It is the reason which gives the civilized man his advantage over the savage, makes the officer more enduring than the soldier, and ensures the dominion of the world always to that portion of the race which makes most use of its brains. Country life, with all its advantages, has the very great disadvantage of being, intellectually considered, a sluggish life. It seldom calls for a rapid use of the faculties, and does not offer any great variety of objects for the exercise of them; so that, all else being the same, a totally illiterate street-boy will have great advantage in any trial of mingled skill and endurance over a totally illiterate country boy. The city boy who leads a tolerably healthy life is, therefore, better armed at the outset for any struggle which requires a very nice adjustment of nervous power to the overcoming of a given set of difficulties. Any marked difference in intellectual training is likely to increase this advantage. One of the most valuable results of this training is the increase it makes in a man's capacity for working for remote results, without diminution of ardor or vigor—a capacity on which civilization may be said to rest; and there is, perhaps, no point of both the moral and physical constitution which is more thoroughly tested by a boat race than this. The more of it a man has, the better military officer, or student, or business man, or rower he is likely to make. To be able to see things far off as if they were near, and act as if a year hence were to-morrow, is the very essence of what is called "bottom," or staying-power in a man. The process of training for a boat race is constantly talked of as if it were simply an affair of muscle, and, therefore, as if the man who had cut down most trees or pitched most hay was sure to stand it best, and win the race. But it is in reality only an affair of muscle in a minor degree; it is mainly a trial of nervous force. The man who can on the appointed day, after two or three months of hard work, worry, and excitement, bring his bodily powers most completely within the control of his brain, will win the race, supposing his muscles to be as tough as those of his competitors; and the chances are that this man will be the best-fed, best-taught man, and the man who has, on the whole, had most practice in the rapid concentration of his faculties on a given piece of exertion; so that all reliance on anterior hod-carrying, or hoeing, or mowing, or lumbering, though it is sometimes sweet, is apt to be delusive.

It is sincerely to be hoped, however, in the interest of genuine culture, that the victory each year at the university boat

races will not be confined to any one college, but that newcomers will, as this year, get a fair share of it. It is in the power of every college which has a good piece of water near it to make up a good crew by applying the right tests; and the better the chance of winning seems to be, the more colleges will try, and the more widely diffused through the country will be the really valuable tastes and habits which boat-racing tends to cultivate.

THE LAST REVIEW IN PARIS.

PARIS, July 3.

MILITARY reviews have always been a favorite spectacle for all Frenchmen. I remember, as if it were yesterday, the first I witnessed. I still feel my hand in my father's hand when he took me to the Place Kleber for my first review; I was only twelve years old, and was living under the mild and happy reign of Louis Philippe, the Napoleon of peace, as he was sometimes called. I had hardly ever allowed my mind to think of the horrors of war. The statue of the gigantic Kleber in his uniform of general of the Republic appeared to me like the figure of a good-natured man, who, I thought to myself with some envy, must have been very strong. In those golden days, the soldiers of Baden and those of France who mounted guard on the two opposite ends of the bridge of Kehl often fraternized, and did not look upon each other as enemies. How bright and gay this first review seemed to me when the batteries went round the Place, the horses at full gallop! I enjoyed the brilliant uniforms, the invigorating sounds of the military bands, even the awful sound of the drums. One poor fellow was thrown off his horse; I trembled for him, but he got up and remounted his horse immediately, looking only a little flushed and defiant. We had in Strasbourg our favorite, our crack regiment, made up almost entirely of Alsatians; a regiment of *pontonniers* was constantly quartered there, as the Rhine was an admirable field for its exercise. The Alsatians have always preferred the artillery to all other arms; they all ride well, they are generally taller than the common infantry-men, and there is a mysterious affinity between them and a battery of clean and solid guns. No review will ever be to me what these reviews of my childhood were: I trembled with excitement, with a mixture of awe and pleasure, when I saw the great waves of horses and men roll before me with a splendid regularity. All the arguments of the philosophers and the philanthropists have never destroyed my instinctive admiration for the army; have we anything more precious than our life? The man who is always willing, always ready to give away his life for his country, is, after all, the man by excellence; and there was good reason in our old régime why the profession of arms should have been deemed the natural profession of a gentleman. But the devotion of a Condé or a Turenne to his country seems less sublime than the obscure devotion of the young peasant who expects no promotion, who has left his family and his fields, and who gives a few years of his life to what he calls his country, to a half-ideal, half-material idol. He knows he is but an atom, but he is willing to be crushed; he mingles with thousands of other atoms, without any other will than the will of obedience. Can even your non-resistants in America think without pride of the men who fought at Gettysburg? Can anybody read the words of Lincoln on the soldiers who fell on that eventful day without feeling some heroic appetite?

After the reviews of Strasbourg, I remember well those of the first years of the Empire. My feelings were no longer those of a child; I was not a friend of the Empire, I did not approve its system of perpetual war; but I could not deny myself the pleasure of seeing the return to Paris of the army of the Crimea. I was in a small café on the Boulevard des Italiens, and from a window I saw the famous zouaves who had entered Malakoff arrive in their ragged uniforms and with their tattered flags. They were not guilty of any selfish or ambitious schemes; they had simply done their duty. They marched quietly, still laden with all the utensils of the camp, and on both sides the boulevard was lined with an exultant people. There was something more pompous and theatrical in the return of the army of Italy. The rugged warriors of the Crimea had suffered so many hardships that they cared not much on their return for appearances; the Italian campaign had been short; Napoleon III. stood before the Vendôme Column, having his son, then almost a child, by him; and the army marched in perfect order before three generations, as it were, of Cæsars. The mind was transported forcibly to the times of the great triumphs in Rome illustrated by Mantegna and many others.

I saw none of the ordinary reviews held under the Empire at the Bois de Boulogne; they were mere military pageants, they formed a part of the programme "panem et circenses"; and for all the foreign kings and emperors who came to pay their court to Napoleon III. they formed, so to speak, the *revers de la médaille* of the splendid hospitality offered to them by the French Emperor. A royal visit was a drama which began with court balls, gala representations at the opera, hunting and shooting days at Compiègne and Fontainebleau, and which invariably terminated with the show of an army which was then thought invincible. It may be that the keen eye of Moltke perceived already in its brilliant regiments the first symptoms of disorder and of disorganization; the old King of Prussia was used himself to the counting of men in battalions and of horses in squadrons. They were both with the Emperor of Russia on the famous day when Berezowski attempted the life of the Czar as he was returning from Longchamps to Paris. Shall I speak of other reviews held in that place? The King of Prussia passed in review there the troops who entered Paris after the capitulation. Is there a Frenchman who witnessed this review? Saxons, Würtembergers, the Prussian Guard, fractions of all the corps, marched before the Emperor; Prince Bismarck in uniform joined the army as far as the Arc de Triomphe, he merely gave a look at the Champs Elysées, he saw them lined with Germans, and galloped back to Versailles.

Then came the second siege of Paris; our prisoners, coming from Germany, learned on their arrival that it was for them to attack the capital. They did not hesitate; after months of captivity, they re-entered the ranks of a completely disorganized army, and they began the terrible war against the Commune—a war of ambuscades, of patience. They conquered Paris quarter by quarter, street by street, sometimes house by house. Eight thousand French soldiers lost their lives in this conflict, as many almost as at Gravelotte or at Wörth. They were commanded by MacMahon; he had come from Germany, thinking that all was over with him, and Thiers had told him that he must take Paris from the insurgents, who had been left in possession of all the forts. The soldiers believed in MacMahon, and he believed in them; he accepted the terrible task; he witnessed the conflagration of Paris from the hills of Montretout during that dreadful night when it was feared that all the monuments of the capital would become ruins. He reviewed his army a few days afterwards in the Bois de Boulogne, and though M. Thiers was still in power, a keen observer might have discovered even on that day that the chief of the army would soon become perforce the President of a Republic which, under a civilian, constantly threatened to become another Commune. It is certainly a curious fact that an army which had suffered such crushing defeats during the war with Germany, which had almost ceased to exist as an army, should so soon become again the arbiter of the nation. It is owing to the Commune; and as the Terror may be said to have ruined the first Republic, and the insurrection of June the Republic of 1848, so the Commune, if it did not put an end to the existence of the Republic, at any rate gave the power to the army and its representatives.

Marshal MacMahon is a silent and enigmatic man; he has probably few political passions; he owes his title of Duke, his dignity of Marshal, to the Second Empire, but he has little affection for what remains of the fallen régime. The Emperor, much against his will, forced him to leave Châlons, where he wished to wait for the Germans, and to make the fatal march on Sedan. I reached the conviction that the Marshal would play a political rôle when I saw him, day after day, come to the Assembly. He always remained in a box (the Assembly sits in the old theatre of Louis XIV.) on the second tier, behind one of his aides-de-camp, but watched very eagerly all the debates. He probably formed then his opinions as to the divisions of the Assembly, and the difficulties of a political solution, and became slowly convinced that he should finally become the solution.

He was already in power when the Shah of Persia arrived; the Marshal offered him, among other pleasures, a great review in the Bois de Boulogne. It was a short time after the 24th May, and for the first time MacMahon appeared before the army not only as Marshal but as the President. He left, however, the Shah, with all his diamonds, among the ladies and the civilians, and placed himself as usual among his troops. The army of the Commune had already changed its character; the troops which had retaken Paris, when they were first reviewed, looked more like bands of armed men than like organized regiments. The policemen of Paris had all been organized in a regiment; they had to avenge their friends, taken as hostages and murdered in the prisons; even the custom-house officials formed small battalions. None of these improvised troops passed before the Shah; everything was already put in order; but the cavalry, mounted on small Arab horses, looked still disorderly, the batteries were not neatly equipped. It was very different last Sunday, when an army of 55,000 men were reviewed by the President in the plain of Longchamps. Prince Hohenlohe, who was in the box of the President of the Assembly, was probably surprised to see how rapidly the French army has been reorganized. The object of the review, however, was less military than political. The Marshal had grown tired of all the intrigues of the Bonapartists and the ultra-Legitimists; the Assembly was discussing whether the Septennat should be personal or impersonal, whether there should be a Septennial Republic or a Republican Septennat. The Duc de

Larochefoucault-Bisaccia, French Ambassador at the Court of St. James's, had come home and proposed to proclaimat once Henri V.; M. Casimir—Périer, an ex-Monarchist who has gone over to the Republic, had proposed to proclaim the definitive Republic. The Assembly, the Committee of Thirty, seemed completely helpless. The Marshal might have sent a message to the House, and said on what terms he was willing to remain in power. He preferred to speak to the army and to the people: "The National Assembly," says he in his order of the day to the troops after the review, "having confided to me for seven years the executive power, has placed in my hands, during this period, the guardianship of order and of the public peace. This part of the mission entrusted to me belongs also to you. We will fulfil it together to the end, and maintain everywhere the authority of the law and the respect which is due to it."

This is very plain language; and, would you believe it? the Republican papers speak of it in terms of eulogy! One Republican paper actually remarks that there were more Republican deputies at the review than Monarchical deputies. The most devoted senators of the First Empire were the old Jacobins. It would be a great mistake, however, to imagine that the Marshal—who says now as he did at Malakoff, "J'y suis, j'y reste"—thinks of preparing the Empire. If he does pave the way for the Empire, he is unconscious of it; he will remain President for seven years, and then France must judge for herself. The country will then probably do what the Assembly did on the 24th of May—place the most energetic man in power.

THE COLLEGE RACES.

SARATOGA, July 20.

OF the thousands of persons present on Saturday last at Saratoga Lake, very few indeed but must have seen a great portion of the race; the air was beautifully clear and bright, the water was smooth, and consequently the starting-line was visible from the finish-line even without a glass. But at the same time, to see the whole race from end to end with anything like the accuracy which alone could give the observer a right to speak about details, must have fallen to the lot of a still smaller number of persons and an extremely small number. One would not think so to read the newspapers; but the writings of the correspondents, both as done before the race and since, show very plainly that among us the business of training men for a race, of rowing it, and of discoursing on the subject meantime and afterwards, is still to a great degree in its experimental, tentative, formative stages. So far as this remark refers to the oarsmen it applies fully only to collegians; as for our professional oars, some of them have given a perfectly good account of themselves when pitted against competitors of the first order coming from countries where boat-racing has long had its home; and they hold themselves ready to do the same thing again. But in general our regattas and their management are marked by inexperience and rawness; and this is true of them from the choice of a timekeeper at the last moment before the start, and his performance of his duties as the boats go over the line, away back to the selection by a college club of its captain; the captain's selection of a stroke, English or American, and his trip across the water to learn it; the crew's controversy as to the value of the arm muscles in comparison with other muscles; the newspaper correspondents' flamboyant reports about the amount of logging and wood-sawing done in earlier life by this and that member of this and that crew, and the terrible stroke or the mighty stroke thus acquired by the young countryman. For a great deal of this crudeness and lack of knowledge there is no one much to be blamed; we must go before we run and creep before we walk, and college crews and captains and city committees are as yet to be taught. But the failure to recognize this truth and to see that it is as relevant to boating as to other things, tends among its numerous other results to the production of newspaper letters which not only must cause some amusement and some exasperation to an expert, but which moreover are apt to mislead the public and do some injustice, perhaps great injustice, to the men and things written about, and this is for all reasons to be regretted. For example, it must be anything but pleasant for a captain of a boat to be denounced in print for certainly and obviously fouling an antagonist, his critic being a writer who is as competent to speak on peaceful practice-rowing, let alone the technicalities of semi-hostile struggling for victory, as he is to speak of the hydrophobic cases which were his last topic before going up to Saratoga. So fearless and so discursive, comprehensive, dogmatic, and also uninformed and inexpert were many of the correspondents, that one fellow-worker of theirs, endowed with the *vis comica*, unexpectedly set himself to satirizing the effusions of some of them, and he did it with as much truth as drollery. Some of the others were not open to his attacks, as, for example, the correspondents of the *World*, who, shunning with due reticence the technicalities of detail, gave sensible accounts of the crews and their movements, and at the end described the race with abundance of spirit and not a little pictorial power. Here is what our satirizing gentleman saw at the quarters of the Princeton university crew:

"Addick does credit to the Quaker City. He spends his spare time on the front piazza with the beautiful daughters of Mr. Riley. His devotion to the classics is as marked as is his liking for the society of the fair sex. He has been known on examination, after making a mistake, to go up and convince the teacher that he was right. He is a good starboard stroke.

"Hall is a good-looking blonde, with a pure Dublin accent. He is from New York City, and occupies his spare moments in making a part in his back hair and making comparative mathematical calculations of the time it will take his moustache to sprout.

"Taylor is a handsome blonde from the Quaker City; is in the port-waist, and about the heaviest man in this crew of light-weights. He is the Crichton of the crew.

"Smith, of Paterson, New Jersey, the bow oar and captain, is a smooth-faced, tawny blonde, with an innocent countenance, close-cropped hair, and, though the shortest man of the crew, is well put together. He thinks that early rising may be good for other people."

This is not particularly dignified, but it is as good as half columns about "the English stroke" of a certain crew; and about the loins and the reach and the determined mouth of somebody in the port-waist of the boat of another crew, who perhaps does, and perhaps does not, pull his own weight.

To take another instance, and a more general one, of the haste and carelessness in which our writers for the press may indulge themselves in doing their work: One of our New York morning papers, and one which in some respects is conservatively edited, sent out a correspondent a month ago to visit the various colleges and send back some report of the plans and hopes of the crews. Yale College and Harvard College are not obscure institutions of learning; and the early history of neither is inaccessible; but when this correspondent reached New Haven, he wrote home in an easy way that Harvard, as he understood the matter, was originally based on Unitarian ideas, while Yale's first foundation rested upon that sturdy Presbyterianism which prevails in Western and Central New York—a view of the annals which would surprise Dr. Abraham Pierson or Dr. Dunster.

All this might need no mention, but the regatta has already given rise to a great many disputes and much hard feeling between two of the colleges interested, and of this we have probably not heard the last; nor is it probable that there will be wanting on the one side and the other, from writers for the press and from persons unconnected with it, a number of witnesses to whose testimony it would be a mistake to attach any weight. The race, as seen by me, was seen from the press-boat *Commodore Brady*, which at half-past ten Saturday morning lay half a mile down the course waiting for the start, and when that had taken place steamed down the right-hand side of the course, keeping abreast of the crews as long as was practicable after they had overtaken us. Our boat did her duty well for nearly two miles, although we were gradually and slowly but surely falling behind, and at the finish were not within a short enough eye-shot of the boats to make out which was first, which second, and which third. I ought hardly to say, however, that we did not feel sure which was first, though I for one could not quite make out by looking; Columbia, which early put herself at the head of the fleet, and, despite great efforts on the part of three other crews, maintained it well, visibly had an advantage as she, Wesleyan, and Harvard passed on towards the end which left us in no real doubt about her victory. As at the finish, so at the start, we were a trifle too far off to see exactly which crew caught the water first, and precisely in what order they came down the first quarter of a mile. We could see plainly enough that as the smoke of the starter's pistol rose against the background of Snake Hill, they were every one off almost before the report of the pistol reached us, and that it was a good start; but stretched out as the nine boats were over so long a line, it was difficult for us, looking at them end on, to perceive how they stood relatively to each other. Here again, however, an exception may be made in the case of the Columbias, for being placed out at the western end of the line they gave us a partly lateral view of them, and apparently they were almost at once foremost. The sight was at this time very fine. The water under our gunwales was black and clear, but the general surface of the lake was of a silver-grey in the sun; the nine boats—soon to absorb all our attention—were coming down over it at a great rate, the oars flashing at their regular intervals; and the whole scene was set in a framework of green banks, behind which at a little distance was the range of blue hills which greatly help to make Saratoga Lake the beautiful sheet of water that it is.

Some little time before the leading boats came up on a level with us we could see that the race had begun to lie among four crews. Of these one was the Columbias, pulling without much of what used to be called style, but pulling all together, and making it apparent to the most uninstructed eye that their boat was going very fast and apparently without

trouble to the men. In the same company were the Harvards, the Wesleyans, and the Yales, the latter being as yet the hindmost, and apparently rowing as well within themselves as Columbia, but not more so, and with a slower stroke. Behind came the rest of the contestants, the Williams men indeed almost deserving at this point of the course, and still later also, to be named with the other four, so strongly and steadily did this crew, to which everybody wished good luck, lay themselves down to the oars. Close at hand were the Dartmouth and Cornell boats, and, last, Trinity and Princeton, already pretty well tailed out from the others. A little further on, also, the sight was remarkable and worthy of enthusiasm not only by reason of its beauty, but for something else. Columbia, Harvard, Wesleyan, and Yale were so close together—so too close together, it was feared—that, as the horse-racers say, the four of them might have been covered with a blanket. The light-blue head-handkerchief of the Columbias, the showy and eye-striking red of the Harvards, the deep-blue of the Yales, and the lavender of the Wesleyans, together with the bright glitter of the oars, gave the picture great vivacity, and the swaying motion of course emphasized everything. The general forward motion it is not easy to describe. Some readers may recollect a child's toy made like the machine called "a lazy-tongs" (of which a specimen is the trellis-like gate with movable slats which is used by the Hoboken Ferry Company). The toy used to be composed further of wooden soldiers painted of various dyes, and the play with it consisted in placing these images on pegs and moving the lattice-work so that at one moment the regiment was longer, at another shorter and more compact. The boats went in something of the same see-saw fashion. Now the lavender would creep forward, now the blue, now there would be a little relative change between the red handkerchiefs and the dark-blue, or the red and the pale-blue. But they were all close companions, and the little raft of boats went down the course in a way to remind one, partly by similarity, of Wordsworth's cloud, that

"Moveth altogether if it move at all,"

and partly to remind one of it by contrast, so constant in energy and activity were the individual elements composing the mass. This, if I may say so with due reserve, was the best part of the race, both considered as rowing and as a spectacle, and was a sight which any one seeing it would have wished should last longer. But at the utmost seventeen or eighteen minutes could be the term of its existence.

About as the mile-and-a-quarter flag was reached by the foremost contestants, we suddenly saw a dash of spray fling itself up between the Yale boat and the Harvard, and all of a sudden the Harvard crew stopped rowing. This delay seemed to me to last while the boat might have been taking three strokes—a period, as I guess, of about five seconds. Some might contend that the delay lasted no longer than the time required for two strokes. However that may be, the cause of it, such as it was, long or short, is alleged to have been the misconduct or the misfortune of the Yale captain in causing a collision of oars which locked oar-blades, or in some other way for a moment or two prevented pulling. As I understand it, this collision is one of the two passages of arms between these crews upon which Captain Goodwin of the Cambridge boat based the claim of a foul. As for the mention of a possible misfortune's having brought about the trouble, it is not the Harvard complainants who put the matter so mildly as that. They assert wantonness of misconduct; and so in turn do their antagonists.

But to leave that matter until later. Before Harvard was under way again the three boats of which she had thus far been a consort had drawn entirely clear of her, and she now began rowing hard to regain her place. While she was thus employed her immediate rival, which had kept on without stopping, and was rowing strongly, was working for the lead, and, as was afterwards stated, this she succeeded in getting; for at the mile-and-a-half flag Yale was reported by the signal-man as being first, with Columbia in the second place. This was not a lead with clear water between the boats, but a forcing of the bow of the one boat ahead of that of the other—if indeed the report of the signal-men be trustworthy, which there is reason to doubt; for the signal-man at the finish—the most important place—was unfit for his task, and I trust none of them. Harvard was at this time spurting, the stroke being nearly, if not quite, thirty-seven to the minute; and, so far as we could make out from where we were, she had in a brief time made good her old place, that is to say, so far as getting back into the society of Columbia, Wesleyan, and Yale; the positions of the crews relatively to each other I could not tell, except that the Columbias seemed to be doing well at the front, and to be assuredly rowing a three-mile race and not the two-mile race which some had been predicting for them. But hardly had the Harvard boat made her reappearance when we observed much more of a splashing of spray than had occurred before, a longer stop, an evident hasty wrangle, and then Harvard went on again, going at a great pace—I do not know how fast, but I should think about as fast as she went a little later when, as she was nearing the Grand Stand, I counted her at forty and a fraction to the minute. In fact, if I am not mistaken, a rough but sufficiently accurate description of the last half of the race, so far as concerns this crew, would be that the men were called on for pretty steady spurting, with the expectation of making up some of their lost ground, and with the hope or half-hope of overhauling Wesleyan and perhaps Columbia. As for Yale, after the second clash had come she did not attempt to go on, but stopped racing for good and all. The reason was by-and-by apparent, for she paddled in to the judges' boat with a demolished rudder and an oar broken off close beside the rowlock-leather. Arriving, Captain Cook preferred a claim of foul against Harvard, and Harvard preferred hers against Yale. Thus was one of these fine crews wholly out of the race while as yet the contest was only half over and everything might still be gained; and the other was to a serious extent impeded in its efforts for victory.

To decide which of them was most in fault would be next to impossible were one to give ear to every story that has been excitedly told by themselves or their respective friends, both orally and in print. In fact, one or two of the stories which have been told with deliberation, and which might easily be taken for true by many people, are nevertheless such as at once arouse an incredulity which will hardly vanish no matter how directly and circumstantially attacked. Thus it is averred that one of the antagonistic captains felt compelled, some days before the race, to notify the authorities that he had been informed of the other captain's open assertion that if his crew did not win, the rival crew at all events should not. But are we in reason to believe this? A captain may be less polished, and more violently in earnest in his racing, and more profane in his anger, than is consistent with decorum or with the breeding of a gentlemanly person; but to believe him so foolishly imprudent as this is not easy. It is, on the whole, best to leave the comments on the affair to the referee, though it is proper, too, to say that clearly the old feeling of rivalship between Harvard and Yale, and of something harsher than rivalship, has this year seemed to be intensified, and that an outbreak of it came very readily. Neither party was at any time careful to conceal its dislike of the other; but Yale had the ill-luck to give to hers a far freer, noiser, and also more quotable expression, and she has suffered accordingly. The language which the referee has used in regard to the case is as follows:

"Both crews had shown a bad spirit in the race; had either had a disposition to give way, there would have been no accident. His own careful observation showed Yale to be the more blamable of the two. The disposition of Yale to encroach upon Harvard was shown early in the race. At seven-eighths of a mile out, the latter was leading and keeping to her course pretty well. Yale coming on behind appeared as if she meant to cross Harvard's course and take a position to the west of her, but suddenly the Yale boat was turned with a sharp sheer to the westward, and it narrowly missed Harvard's rudder. It really appeared as if Yale had tried to carry away the rudder but had missed it. It had that look. The final accident or collision took place about the mile-and-a-half point."

And so forth, and so forth—all a bad business. It did not end on the water. On land there was much crimination and recrimination, much swearing; and in one instance, if I am not misinformed, a challenge to fight. It is this and similar things which are referred to in the brief but pointed correspondence between the two captains which occurred early in the afternoon, and in which Yale offered to row Harvard again over the same course, and Captain Goodwin, "in view of the conduct of the Yale University crew, not only during the race just completed but also at its conclusion, declines to entertain any challenge whatever from the Yale University crew."

Much pleasanter scenes were going on in the town, or village, as they call this very pretty, wide-streeted, well-fountained town, abounding in trees and in spacious hotels. The students were in full possession, and were marching up and down with music, leading their columns through the hotel offices amid inexhaustible hurrahs from their own throats and the waving of handkerchiefs and college colors by the ladies. Columbia—which by the bye cheers itself in an ingenious manner by spelling out the letters of its name in a very staccato fashion—fraternized with the Cambridge men, who waved magenta flags beside the light-blue-and-white, while Yale and Wesleyan paraded together with nearly equal noise, but with rather less spirit. One of the agreeable incidents of this celebration was the arrival of one of the winning crew at Congress Hall. He was in a triumphal wagon—one of the earliest vehicles in from the lake—which, like old Van Tromp's or De Ruyter's flag-ship, bore a broom as an emblem that a clean sweep had been made by the blue-and-white. As he got down, his fellow-students shouldered him and ran him with great shouting up the hotel steps, at the top of which, as I was told, were his father and mother in much delight.

In many ways the regatta was a great success. The members of the committees were attentive, kind, and much more than usually efficient. The

course is an admirable one in several respects, though it seems probable that the delegation of townsmen—at whose head by the bye was a fluent real-estate agent—were somewhat too loud and too absolute in their protestations to the College Rowing Association about the smoothness of the course. Yet there seems little doubt that the wind, which as it happened was allowed to delay the race two days, need not have been allowed to delay it more than one day, if so long. The true plan would seem to be to set an early hour in the morning, irrespective of the late breakfasts of hotel guests, and then leave it in the referee's power to order the race when the water may be fit. This secures the whole day for leeway, and appears far preferable to fixing a hard and fast line at five or six o'clock for a race on a lake said to be liable to afternoon winds. If this difficulty can be got over, the other disadvantages of Saratoga are more than balanced by the advantages—the healthy air; the great hotels capable of receiving vast and sudden crowds; the width and straightness of a course capable of accommodating nine crews abreast, or twice nine even. Some certainty about the winds and some better means of getting out to the lake shore are the great desiderata, and careful observations should do a good deal towards giving us the one, and the Saratoga and Rensselaer Railway Company may perhaps some time see fit to give us the other.

Notes.

TWO Arctic navigators appear as authors in the Harpers' list of forthcoming publications: Captain Tyson in 'Arctic Adventures,' including those of the *Polaris;* and Captain W. M. Davis in 'The Nimrod of the Sea; or, The American Whaleman.'——Butler's 'Wild North Land' will be reprinted by Porter & Coates.——The Appletons are to publish by subscription Schenck's 'Life and Public Services of S. P. Chase' (authorized).

—J. R. Osgood & Co.'s 'Middle States: a Hand-book for Travellers' is the most notable of the guide-books of the present season. It is, like their 'New England Guide,' patterned after Baedeker, and has all the many excellences of the former work. The ground covered from north to south embraces Canada as far as Montreal, and part of Northern Virginia. Foreign visitors to this country will find pretty much all that is worth seeing set down in this hand-book, with clearness and sufficient detail, and, in certain particulars, with something of the self-satisfaction with which Dr. von Holst reproaches the Americans with viewing themselves and their productions. This genial trait is perhaps carried as far as it is safe to carry it in the compiler's remark, that "the heating and ventilating arrangements of the House and Senate [at Washington] are worthy of notice." There is a plentiful number of maps and plans, and the historical and descriptive notes are entertainingly written. Deserving of praise also is Mrs. Clara Barnes Martin's unpretentious 'Guide-book to Mount Desert' (Portland: Loring, Short & Harmon). The style of this writer is much above that of the ordinary *cicerone*, and her observations of natural scenery are tasteful and well expressed. For example, in speaking of one of the most striking formations on the island, she says:

"The 'Ovens' have been renamed variously the 'Cloisters,' the 'Via Mala,' the 'Cathedral,' etc.; but if one must have an architectural simile, they are really more like the bold arches with zigzag mouldings in the depths of which the old Romanesque builders placed their doorways. . . . . It is worth while to suggest that the shadows from the west increase the effect both of height and depth."

With a view to making this book a souvenir as well as a guide, the publishers have embellished it with five very delicate photographic vignettes. There are also two good maps, from Coast-Survey data; but we miss a third showing the entire shape of the island and its position with regard to the coast of Maine. The pocket volume published by Estes & Lauriat, 'Our Vacations: Where to go, how to go, and how to enjoy them,' by Frank E. Clark, is addressed principally to the Bostonian, though New Englanders generally and New Yorkers may profit by its suggestions, with only a slight variation from its very moderate estimates of the cost of travel. Three routes are described—to the White Mountains, to Upper and Lower Canada, and to the Provinces; and the "great middle class" whom Mr. Clark aims to serve will find his account of the places visited truthful and trustworthy. His estimates speak for themselves.

—The question of how a community shall select a good work of art to be set up for public adornment and use has always been a difficult one, and has never yet, so far as we have heard, been settled. Princes and magnates of taste or of magnificence have patronized artists whose capacity they appreciated, or in whom they for one reason and another believed as men of talents or genius; and this good understanding and patronage have had noble effects. But when once this personal relation (so to call it) between artist and patron fails, it appears to be very difficult so to arrange matters that any community taken at large shall be able to lay its hands upon the right man to produce for it at a given moment its public works of art. This at all events is true of our American communities, and the fact has long been confessed, the only difficulty being that the portion of the community which makes the confession is small in number and comparatively blameless, while the major portion makes no confession at all and goes on in its sins without remorse. Mr. Sumner, who had a taste for art—the taste, perhaps, of a collector rather than of a person endowed with true taste—plainly told the Senate, when Miss Vinnie Ream wanted a commission to make a statue of Lincoln, that senators might as well place Miss Ream on the staff of General Grant; or put General Grant aside and set her on horseback instead. "She cannót do it," he said, "she might as well contract to furnish an epic poem or the draft of a bankrupt bill." But many of the senators represented constituencies such as the Western one which a year ago was admiring a fancy bust sculptured in lard or butter by a lady who exhibited it at a State fair. It was beautifully done, according to the accounts. Others were from a part of the Union where, some years since, a young artist, Mr. L. G. Mead, did a statue or statues in snow, to the admiration of all beholders. And the question as to skilful hands like these and many more (which actually can make a figure exactly like a human figure, and one which actually looks like So-and-so) whether, that is, they have behind them any of the qualities which make of a man an artist as distinguished from a practitioner of elegant stone-cutting and a statue-maker for "M. or N.," as the catechism says, is a question which few if any legislators, and few other persons, ask themselves. Indeed, there is no reason why they should. They do not know that the question exists. Mr. Sumner spoke in vain, and Miss Ream got her commission, and her Lincoln is now among the monuments of the Capital. It is understood that the same woman has succeeded in getting the commission for the colossal Farragut statue, and this although her design was rejected by the proper Congressional committee; she afterwards secured her contract by the vote of a board of commissioners, of whom a majority were committed in advance to vote for Miss Ream.

—How commissions for public works of art shall be given out is made the subject of a letter from Mr. Richard S. Greenough to the Boston *Advertiser*, and it contains suggestions worth pondering. One especially has so much obvious common sense in it, and is so likely to be disregarded, that particular attention should be called to it: At the end of his communication, Mr. Greenough says that he wishes to declare his belief that statues should rarely be erected to an individual within fifty years of his decease. There will, of course, be exceptions to this rule, but we imagine they would be of rarer occurrence than might be supposed. And it should be remembered that the modern public statue, as we in this country know it, is in every case a tribute to men who have in one way and another actively served the state. There was no reason why an Antinous should not be commemorated in marble on the day of his death, nor why any Serene Highness who, by ruling over his principality, had *ex officio* a right to a monument perennial in its bronze, should not have his effigies at once set up in the town square. But with us it is different, and time should be allowed the devil's advocate to show the needlessness of statues to General Worths and Stephen A. Douglases and Elias Howes. Mr. Greenough's other suggestions stated briefly are these: To begin with, the excellence of a work of art may be referred to several qualities, as, first, Design; second, Composition; third, Execution; fourth, Material. Absence of excellence in any one of these qualities may unfit a work for public usefulness. As regards works in sculpture, their merit in respect of the first three qualities may be secured by reference to study-models, and, in respect of the fourth, material may be secured by contract. As to conferring public commissions, there are two methods of doing so—first, by direct commission; second, by competition. For the first, time is not as yet ripe; for the second, artists dislike it as hitherto employed, but improvement may be possible. Mr. Greenough would have the commissioners send a special invitation to certain artists of reputation, and the designs thus secured he would have paid for at a fixed and sufficient rate, the honor of the solicitation counting for something. At the same time, a public notice should be given inviting all artists whatsoever to compete at their own expense and risk, and this invitation should not bar out foreign artists. We do not know if the first and special invitation is to be sent to our American artists to the exclusion of foreigners. The designs being all in, the commission should vote on them, and then its functions, so far as design goes, should cease. Next, artists of a certain grade should be allowed to vote, the qualification for casting an artist's vote being a thing to be determined by the commissioners. These two ballotings being recorded, the public might be called in and vote without distinction of sex, but with this distinction of age: If the statue is for a city, the voter should

be above the age of twenty-five; if for a State, above thirty-five; and if for the country at large, forty-five. It will be seen that a trial in practice would have important bearings on this theory, as indeed Mr. Greenough himself remarks.

—Persons friendly to the better education of women will be interested in hearing about such measure of success as now, in the day of small things, has attended the Harvard Examinations for Women. The examiners have not made their report, and we must as yet admit it to be within the possibilities that they may report unfavorably; but it is not within the probabilities, and the promoters of the movement speak of it with a hopeful satisfaction. They announce that the number of candidates for examination was eleven; but of these one was too young, being less than seventeen years old; three others "were prevented by circumstances beyond their control from carrying out their purpose"; and the number actually present was seven. It should be remembered that the notice had been out barely a year, so that the number of candidates is said to have been a surprise to the friends of the enterprise, especially when it was considered that both the age and work required of candidates made it probable that for the first year the candidates must come from persons employed in teaching and having at their disposal but little time for study. While awaiting the examiners' report, the committee of the Boston Education Society allows itself some inferences in good part drawn from its wide correspondence. In the first place, the committee thinks that while the applicants this year were but seven, the number preparing themselves for two and three years hence is not less than seventy. Secondly, it is evident to the committee that the desire for a definite plan of study at which to work has not been overrated. Thirdly, it seems to be quite possible, even for teachers in charge of primary schools containing fifty or sixty pupils, to find time for work in the line of the examination papers. And surely, we may say in passing, such students deserve success and sympathy. Judging by the committee's communication to the public, it is to a very great extent from the various classes of teachers that they have drawn, and that they expect in future to draw, their recruits. They say: "Some plan must be devised by which study can be carried on parallel with work, and the result made of value in obtaining higher positions and more pay." And, again, for the teacher constantly comes to view: "We, here in the United States, must employ women as teachers in numbers and proportions wholly unknown anywhere else, and while they remain in the work not more than five years on the average—the average for Massachusetts; in other States it is less—it is hopeless to talk of training them as men are trained for life-work." Then follows the remark quoted above, about the need of a plan for enabling school teachers to carry on work in school side by side with work done for the examiners. We hope these latter, in making their report, may give us some information as to the relative numbers of teachers and of young ladies without occupation who presented themselves at the examination, and also as to English experience in this respect. The committee close by reminding the public that "the examinations are by no means limited to Boston and its vicinity. The university is ready to do its part of furnishing papers, examiners, and certificates wherever an association will take in hand the rest of the work." For information and for specimen papers and so forth, application may be made to Mrs. C. G. Loring, No. 1 Mt. Vernon Place. The specimen papers and the pamphlet containing lists of books are forwarded for the nominal price of twenty-five cents.

—The London *Spectator* is a journal of such ability and such goodness that not to accord it respect is impossible; but once in so often it suffers from hysteria, and in its fits it not only enunciates strange ideas, which it insists upon in a hectic way, but it discovers also facts of a character to be called paroxysmal. In its last number it informs its readers that General Grant in his candidacy for the Presidential chair lost hardly a vote in spite of the strong suspicion that he is a Roman Catholic. The *Spectator*, with its interest in American affairs and its frequently wise conclusions about them, intermixed with its frequent errors, should give up one department of its omniscience and take counsel now and then with some terrene American creature resident in London.

—Gen. Schenck's customary announcement in the London *Times* that he would be glad to meet his countrymen on the Fourth of July excited in the breast of one American resident at least feelings the very opposite of those intended. "To be notified," he writes us hotly on that date, "that we are expected to come and congratulate Gen. Schenck on an official relation that is a public and national humiliation, is a renewal of mortification to which I for one will not submit tamely. There is an additional reason for sensitiveness to Gen. Schenck's disgrace in the shamefaced festivities connected with the opening of Leicester Square (the gift of Albert Grant, the General's confederate in the Emma-Mine swindle), to which I was two days ago a chance witness. As everybody in America knows, doubtless, this Grant made enormous sums of money in Emma-Mine and other stock-swindling operations, and, in order to buy a patent of respectability, purchased and has made a present to the public of the shabbily-kept Leicester Square, changed to a public garden. The festivities reminded me very much of one of Gen. Schenck's receptions. There were many flags, amongst which (as was appropriate) the American was conspicuous; there was a band, and a great effort to appear respectable and select, but of unofficial English respectability nothing to speak of. Meanwhile, in another part of London, a procession was making the rounds with huge placards announcing that Albert Grant, having swindled the English public out of £4,000,000, had returned a trifling per cent. of it in the purchase of Leicester Square; and then other placards gave the names of the stock operations by which Grant had made himself a millionaire; amongst these the Emma was chief. Naturally, the newspapers congratulate the generous donor, as the proper officials did at the presentation, and the rabble of Leicester Square cheered him as he drove off, but respectability still holds aloof, and he has not fared much otherwise than as Gen. Schenck. Comment is satirical and incredulous. I happened that day to dine out with Englishmen, amongst whom at table the day's celebration was subject of conversation, and connected therewith the Emma and its associations, and I heard for the first time (so remote am I from stock conversations) that Gen. Grant is, in England, believed to have made a large sum by the Emma swindle, and therefore retains Schenck in the post he soiled! That the Minister has been for a long time the object of contempt to respectable Englishmen I have always known. Is it any wonder that I am disposed to keep my Fourth of July in the private and silence of my own household, with a sense of shame and irritation quite inconsistent with my presenting myself at the Legation?" Albert Grant, we will add, is the English equivalent of Jay Gould, and is believed to have been the conceiver and executor of the happy stroke by which Schenck's name was secured for the Emma directory.

—The death of Fritz Reuter is a real loss to German literature; his reputation as a novelist is widespread, and although in this country more are familiar with his name than with his writings in the original form, there are many who know the simple charm of 'The Year '13,' and will be ready to lament his death. He was born, November 7, 1810, at Stavenhagen, a small town in Mecklenburg-Schwerin; he studied at Rostock and at Jena, or rather he was connected with that university, but his father having refused to let him cultivate his taste for painting he was averse to devoting much of his time to his books. The German students at that time were thinking of nothing but the possible grandeur of their country, when the Government began its persecution of would-be reformers. Reuter was arrested after the outbreak at Frankfort and condemned to death, but the king commuted his sentence to thirty years' imprisonment, and it was not for seven years, until the death of King Frederick William III., in 1840, that Reuter was set free. An account of his imprisonment is to be found in one of his best works, 'Ut mine Festungstid." The next ten years of his life he passed in restless endeavors to make up for the time he had lost and secure a position in life. He tried in vain studying, painting, and farming. In 1850, he became a teacher in Treptow, being tempted by the meagre salary, on which he married. It was not until 1853 that he began to write. From that date his books appeared rapidly. They have already appeared in an American edition, published by Steiger, of this city, in seven volumes. The unfamiliar appearance of the "Platt-deutsch" is likely to deter many readers familiar with High-German, but who only need two or three hours' practice to read the other. They will find in his stories real humor, much pathos, some charming scenes, and a freshness and vividness that manage to escape most of his translators. He was an ill hand at the careful construction of a story, but he knew how to draw lifelike characters, and, what is more, to make the reader pleased with them.

—The announcement of the first volume of W. Chappell's 'History of Music' reminds us to call the attention of students of Greek music and Greek authors to a letter sent to *Dwight's Journal of Music* for May 30, by A. W. Thayer, from Trieste. The letter relates to Paul Marquard and his edition of the Greek writers on music. Studemund, the editor of Gaius, and the transcriber of the palimpsest of Plautus in the Ambrosian Library at Milan, had projected a similar undertaking, but gave his collection and co-operation to Marquard when the latter commenced his work. All the extant writers were to be included in this series, the Greek text to be accompanied by a German translation and notes. Dr. Deiters, one of the collaborators, was at work upon Aristides Quintilianus, and had this author nearly ready for the press, when the work was interrupted in December, 1872, by Marquard's death at the age of 36. The work upon which Marquard had concentrated his studies was the 'Harmonic Fragments of Aris-

toxenus,' and he had brought out an edition of this author through Weidmann of Berlin in 1868. The interrupted series was to be published by Teubner of Leipzig, and in this Marquard's book was to have appeared in a second edition. It is now very uncertain whether the work will be continued, with, perhaps, Studemund as chief-editor. Mr. Thayer's letter is interesting for its story of Marquard and its mention of the difficulties and characteristics of his undertaking.

—Another work on names (see the *Nation*, No. 469) is Karl Gustaf Andresen's 'Die altdeutschen Personennamen in ihrer Entwickelung und Erscheinung als heutige Geschlechtsnamen' (Mainz, 1873). An earlier essay on names by Andresen, to which he refers in this pamphlet, was published in Kuhn's *Zeitschrift für vergleichende Sprachforschung*, N. F., Vol. I., pp. 465 ff.; and another, very brief, in the *Jahrbücher für Philologie*, 1863 (2), 'Ueber eine Art zusammengesetzter Familiennamen.' His method in the present pamphlet is, after about twenty pages of introduction, to arrange under a number of root-names, for which he does not claim exhaustiveness, their modern derivatives, giving a large place among these derivatives to diminutives and contractions expressive for the most part of familiarity and endearment. He mentions, as especially important authorities in treating these latter forms, Franz Stark's 'Die Kosenamen der Germanen' (Wien. 1868), and K. Strackerjan's 'Die jeverländischen Personennamen' (Jever, 1864). A number of other German authorities on names are referred to in his book, and some of them—the Programms, for instance—are not apt to find their way into the commoner catalogues. A comparison with Miss Yonge's 'History of Christian Names,' which goes over a good deal of ground in common with Andresen, shows some differences between the two authors. Miss Yonge tells us that "Behr and Behring are surnames for the bear in Germany, and the last very appropriately named Behring's Straits." Neither of these names appears in Andresen under Ber, Bär. But while Miss Yonge says truly that Behr is a German surname, the discoverer of the Straits was a Dane. Gustav, Miss Yonge says, means either the divine staff or the staff of the Goths. Andresen puts Gustav under 'Gund, *Krieg*,' after a "plausible conjecture by J. Grimm," and speaks of the word as analogous with Gundastap and Kriegesstab. We doubt whether in this case this kind of analogy is decisive. The reference to 'God, *Gott*' seems to us, in view of well-known Hebrew compounds, to be as plausible a conjecture as Grimm's, and we are disposed, considering the feebleness of vowels in the history of the changes of words, to question whether Gustav and perhaps other surnames with first syllable in Gu should not be included under this head.

—The sixth annual meeting of the American Philological Association was held at Hartford last week (July 14-17). It was one of the largest and most successful meetings of the series, especially noticeable for the number of new members (about forty) and for the general excellence of the papers presented. It is, we think, the first meeting which has not been seriously annoyed and interrupted by wild and unsubstantial theories. The address of the President, Prof. March, delivered on the evening of July 14, was marked by a peculiar grace and humor, and was in the main devoted to a discussion of the future work of philology. It is significant that, like other eminent philologists (as Prof. Whitney, a few years ago in our columns), he takes decided ground in favor of a reform in English spelling. Of the papers read, the most important were two by Prof. Whitney upon the elements of speech; Prof. Short's, upon the Latin of the Vulgate; and two upon Indian philology by Dr. Trumbull. The most animated discussions were called out by papers upon the Greek subjunctive (that never-failing theme) by Prof. Sewall of Bowdoin, and upon the formation of the Latin perfect by Prof. Harkness of Boston. The citizens of Hartford received the Association with great hospitality, and did everything in their power to make the occasion an agreeable one. The next meeting is appointed for Newport. The new president is Dr. J. Hammond Trumbull of Hartford, one of the members to whom the success of the Association is largely due.

FROUDE'S ENGLISH IN IRELAND.*

I.

MR. FROUDE has good gifts. Remarkable literary power, a vivid imagination, skill in discovering and industry in exploring new fields of information, go far to qualify him for historical investigations. Some knowledge of Ireland, a keen eye for the dramatic side of annals filled with tragic incidents, freedom from prejudices which hamper most Englishmen in dealing with the history of a people unlike their own, seem to mark him out for the historian of Ireland. In spite of these, Mr. Froude has failed in the performance of his self-imposed task. His so-called history turns out a political pamphlet, written by an advocate who can hardly even affect judicial impartiality. His apology for the rule of the English in Ireland condemns those whom it is meant to defend, and his political teaching is certain to irritate and insult the Liberals and Catholics whom it is meant to instruct. Calm and sagacious students may learn important lessons from Mr. Froude's pages, though hardly the lessons which he means to enforce. But most readers will refuse to learn from an instructor who exhibits in every line of his work that curious perversity of judgment and want of a sense of justice which more than counterbalance the literary merits of Mr. Froude's writings.

To criticise, within the limits of an article, the spirit of a long book is always a task of difficulty. A critic cannot, for example, within the space at our disposal, examine Mr. Froude's eccentric eulogy of George III., who is treated as "a genius" because he wrote or signed a letter filled with good sentiments which he never attempted to put into practice. It is impossible to enumerate or even give instances of the insulting expressions applied by Mr. Froude to the Irish people and to every leader whom the Irish people have honored. It is impossible to weigh the value or the worthlessness of statements based on letters (many of them from informers) which are not accessible to the general public. It is, in fact, necessary in most cases to assume that Mr. Froude has drawn correct inferences of fact from the evidence before him, though this assumption must be made with fear and trembling by any one who remembers our author's implicit faith in preambles to statutes, or who notices the obliquity of moral view displayed in the statement that "if the Irish Catholics were not guilty in 1641 their estates ought to be restored to the nation from which they were violently taken"—an assertion which virtually amounts to making the tenure of land in Ireland depend for its moral justification on the hypothetical accuracy of Mr. Froude's version of the events of 1641.

The fairest mode of justifying the assertion that Mr. Froude lacks a sense of justice is to direct attention to one or two cases in which this deficiency becomes markedly apparent. Take as a first instance his account of the death of Sheehy. Of the whole matter we know nothing except the facts which Mr. Froude himself narrates, having told the "story at some length on account of the prominence given to it by Irish historians." Father Sheehy was the centre of a Whiteboy conspiracy, and the instigator or abettor of a system of terrorism kept up by assassination. Supposing Sheehy's guilt to be now conclusively brought home to him, he indubitably was "as deep a criminal as ever swung from cross-beam"; but he none the less undoubtedly was, on Mr. Froude's own version of the facts, judicially murdered. He was by a breach of faith entrapped into surrendering to take his trial. This, however, is a trifle compared to what took place at the trial itself. The transaction is thus narrated by Mr. Froude: "The body of Bridges had not been found. Witnesses came forward to swear that he had left the country. It was proved, however, that there had been a conspiracy to murder him. A Mr. Keating, described as a gentleman of property in the county, offered to prove that Father Nicholas [Sheehy] was at his house on the night when the murder was committed, but Mr. Hewetson, a clergyman and an active magistrate, rose in court and said that he had a charge against Keating for having been present at the killing of the soldiers. Keating's evidence was refused, and he was committed to the jail at Kilkenny. The Sheehies were found guilty, and were both hanged." In other words, Sheehy was convicted by the simple process of refusing to hear evidence in his favor. Of the proceeding itself it is unnecessary to say anything. The man may have been a double-dyed villain, but he was murdered. Now for Mr. Froude's comment: "It was an extreme measure: the breach of faith in returning him to Tipperary; the military occupation of the town; the non-discovery of the body, led to an impression, even with moderate persons, that he had been unfairly dealt with." The "impression" is one which will be shared by every one acquainted with the nature either of law or of justice. Mr. Froude, however, asserts that "the Government was essentially right," and appears not to perceive that no subsequent proof of Sheehy's guilt can wipe out the more heinous guilt of his sham trial.

Turn now to a case in which Mr. Froude deals with the treatment not of a man but of a class. If there be one course of procedure which is more opposed than another, not only to common humanity and to the most ordinary sense of justice, but also to the narrow and not always humane rules of English law, it is the use of torture to extort confession. This abuse has never at the darkest periods of English history been countenanced by the law. It has for centuries been in England, at least, absolutely unknown. But the Orangemen of 1798, knowing nothing of justice and having no reason to fear the law, established a system of torture. Picketing, pitch-caps, the lash were the weapons by which they extorted confessions, true or false, from suspected rebels. That men maddened at once by the insolence of domination and by the fear of massacre should act with brutal cruelty, can surprise no one who remembers English feeling during the Indian mutiny. That Lord Clare should defend horrors which shocked trained

* 'The English in Ireland in the Eighteenth Century. By J. A. Froude, M.A.' Vols. II. and III. London: Longmans & Co.; New York: Scribner, Armstrong & Co.

soldiers sent to put down rebellion, causes little surprise to any one who has studied his lordship's career, even in the pages of his admirer. But it is allowable to feel something more than surprise at the language in which an historian, in the calmness of his study, writes of crimes which have earned for the party by whom they were committed a hatred which the lapse of more than half a century has not appeased.

"The United Irishmen had affected the fashion of short hair. The loyalists called them Croppies, and if a Croppy prisoner stood silent when it was certain that he could confess with effect, paper or linen caps smeared with pitch were forced upon his head to bring him to his senses. Such things ought not to have been, and such things would not have been had General Clare been supplied with English troops; but assassins will not always be delicately handled by those whose lives they have threatened." Mr. Froude further adds, that "occasionally, not often, men suffered who were innocent so far as no definite guilt could be proved against them," and concludes a passage too long for entire quotation with this reflection: "Society demands the active aid of all its members to prevent or discover crimes; and men who leave these duties unfulfilled are confounded naturally with the actively guilty, when society thus falls in pieces and military severity is compulsorily substituted for law." These sentences do not require comment, though it may be well to explain (which Mr. Froude, as far as we have remarked, never does) that the "pitch" used by his loyalists was hot pitch. Our readers will without our aid perceive that to confound the innocent with the guilty is the natural result of a system of torture, and is to ordinary minds the height of injustice, and will find no difficulty in distinguishing between the use of the lash and the pitch-cap and what Mr. Froude confounds with it, "military severity." That he and his admirers would probably make light of the distinction, may be admitted; it is exactly this inability to distinguish outrage from severity which shows their want of a sense of justice.

Take as a last example of our historian's spirit his account of one of those cases in which "occasionally men suffered who were innocent":

"This gentleman [Mr. Fitzgerald] did by decisive measures effectually break the insurgent organization in Tipperary, so that when the rebellion came the most dangerous county in Ireland lay motionless. They were not gentle measures. He used the whip freely, and he made one mistake which was not forgotten. A man named Wright, at Clonmel, was suspected of connection with the United Irishmen. The suspicion in all likelihood was well founded. On searching him a letter was found in his pocket in French. Fitzgerald did not understand the language, but his mind, like that of any one else, was full of the expected French invasion. The letter, though utterly innocent, was treated as an evidence of guilt, and Wright was severely flogged. He prosecuted the High Sheriff afterwards, and recovered £500 as damages."

"Fitzgerald has been rewarded with a black name in Irish legend, and with the scorn of foolish historians; he was rewarded also by the knowledge that by his general nerve and bravery he had probably saved at least ten thousand lives, and the English Government, though generally too proud to remember good service in Ireland, yet so far acknowledged Fitzgerald's merits that they paid his fine and created him a baronet."

Turn now from Mr. Froude's pages to the 'State Trials,'* which throw a good deal of additional light on Fitzgerald's character and services. His conduct to Wright reads like that of a maniac. Wright came himself to surrender. The sheriff addressed him in these words: "Fall on your knees and receive your sentence, for you are a rebel and have been a principal in the rebellion. You are to receive five hundred lashes and then be shot." The trial which Wright demanded was refused him. When Wright was brought to the ladder Fitzgerald pulled off his hat, stamped on it, dragged him by the hair, struck him with his sword, and kicked him. A hundred lashes were actually inflicted, and if the victim escaped being hanged or shot he apparently owed his life to the scruples of an officer who had greater respect for the law than had the sheriff. Wright, Mr. Froude will urge, was probably guilty. A jury presided over by two Protestant judges thought otherwise. Fitzgerald, he insinuates, was a relative of the murdered Uniackes. Of the truth of this assertion neither the trial nor the subsequent debate in the Irish Parliament affords the least proof. Fitzgerald's friends were, as the event proved, willing enough to protect him; but they felt that his conduct needed palliation, and would, it may be conjectured, have gladly brought forward any circumstance which might provide some apology for a course of action which even Orangemen of 1799 felt required to be excused. The important fact, however, is that Fitzgerald's assault on Wright was not a solitary outrage. He entered on his office determined to wring out information of treason by means of the lash. The following description of his conduct is given in the *Edinburgh Review*, on the authority of Sir John Moore: "[Moore] entered the town of Clogheen, where in the street he saw a man tied up and under the lash, while the street itself was lined with country people on their knees, with their hats off. He was informed that the High Sheriff, Mr. Fitzgerald, was making great discoveries, and that he had already flogged the truth out of many respectable persons." His rule was, "to flog each person till he told the truth"—that is, until he confessed himself "a rebel and gave the names of other rebels, and then the persons so accused were sent for and flogged until they also confessed, and also swelled the list of the proscribed!"

There were even in 1799 members of the Irish Parliament who told of at least one case in which the attempt to "flog out" truth ended in flogging out falsehood, and who denounced Fitzgerald's system of legal investigation. He stands, however, condemned rather by the conduct of his friends than the assertions of his enemies. His offences had exceeded the limits of a wide act of indemnity. He was threatened with endless actions, brought by persons whom he had injured or insulted. Judges and juries alike were against him. The law would have crushed him, but a Protestant Parliament passed a special act to protect him from the law. In the 'State Trials' is to be found the following note: "Mr. Fitzgerald afterwards received a considerable pension for his active services in quelling the rebellion; he was also created a baronet of the United Kingdom." If this statement be correct, the English Government can hardly be charged with ingratitude for his good service, and Mr. Fitzgerald obtained a more solid reward than the consciousness of that kind of "nerve and bravery" which is shown in flogging helpless wretches till they tell any lie which pleases their tormentors. There may be those who regret that the English Government was not "too proud" to remember good services which deserve nothing but punishment, and there must be some among Mr. Froude's admirers who marvel that a man who, except when he has pen in hand, is no doubt as humane as any other English gentleman, should think it his duty to exculpate a ruffian whom "history has been," most righteously, "pleased to gibbet for his share" in "transactions" which will generally excite the condemnation of all who detest injustice.

* See 27 Howell's 'State Trials,' p. 759.

PIKE'S HISTORY OF CRIME IN ENGLAND.*

ADMIRABLE as it is in some respects, this book is yet a disappointment. The author has been fortunate in his choice of a subject. He has spared no labor in gathering his materials from all authentic sources, published and unpublished, and in these days of book-making he deserves unstinted praise for the rigorous honesty with which he confines himself to original investigation from contemporary authorities, and avoids the short and easy method of compilation from other men's researches. He has thus amassed a large amount of curious information, much of it now for the first time in print, and nearly all of the highest importance, as shedding fresh light upon the institutions, the history, and the social condition of England from the time of the Romans to the accession of the Tudors. To all future students of English history the book will be indispensable, and it would leave little to be desired if the author had illustrated his subject from a somewhat wider range of reading, and had possessed the ability to marshal his facts to the best advantage. As it is, the work is rather the materials for a history than a history. It is a mine from which succeeding writers will draw abundantly and safely, for it has the impress of the conscientious student who takes nothing for granted, and who states no fact without solid proof; but unfortunately it lacks the logical arrangement by which its mass of information would form a continuous story of the progress of human development in England, and for the most part we miss the illustrations from the jurisprudence of other races which would lend fresh interest and a clearer understanding to many subjects of which the author gives but a limited and imperfect view.

Thus, scattered throughout the volume are ample materials for tracing the rise of the jury system from its rude beginnings in compurgation, through the time in which jurors were witnesses as well as judges; but the author leaves the reader to pick these out and co-ordinate them for himself. So, too, this very subject of compurgation, or the wager of law, is treated as though it were an institution peculiar to England, and the vast amount of instructive illustration which it might receive from the canon law and contemporary customs throughout Europe is utterly neglected, no reference even being made to the "raith" of the Welsh codes. In fact, though Mr. Pike laboriously presents the evidence deducible from Tacitus and Cæsar to show the institutions which the Saxons imported into England, he seems to think it altogether unnecessary to follow up the sources thus indicated, and trace the influence which undoubtedly was exercised upon English customs by the Continental races, and especially by the Normans. No one, indeed, can properly understand the sources of the English common law without careful

* 'A History of Crime in England, illustrating the Changes of the Laws in the Progress of Civilization. Written from the Public Records, and other Contemporary Evidence. By Luke Owen Pike, M.A., Barrister-at-Law.' Vol. I., from the Roman Invasion to the Accession of Henry VII. 8vo. London: Smith, Elder & Co. 1873.

study of the coutumier of Normandy, for which the activity of Continental scholars has furnished abundant materials, yet to this Mr. Pike makes not a single reference. He of course is obliged to make use of the code promulgated for England by Canute, and it seems incredible that this should not have directed his attention to the invaluable material contained in the legislation of Scandinavia and Iceland. That curious anomaly of English law, the benefit of clergy, affords to Mr. Pike the subject of reasonable animadversion, yet no one could gather from his pages its origin in the canon law common to all Christendom, or suppose that England only differed from the rest of Europe in adopting the reading test as a proof of "clergy," and in retaining it after other races had succeeded in practically abolishing it. The same narrowness of view has prevented his recognizing and pointing out the profound influence exercised by the revival of the Roman law in breaking down the feudal system. Though this is less apparent in England than in France, and though the English refused to allow the Imperial jurisprudence a formal foothold within the island, nevertheless its principles interpenetrated and largely aided in moulding the common law and modified the relations between the suzerain and his vassals. A similar lack of comprehensiveness is noticeable in the treatment of the commercial development to which the author assigns its proper share in the progress of England. His constant reference to the mercantile shortcomings of English merchants renders it surprising that he should have overlooked the illustrations to be found in the mercantile codes which England did so much to mould into shape—the Rôles d'Oléron, the Laws of Wisby, and the Consulat de la Mer.

It could be wished also that Mr. Pike had given, as he is abundantly able to do from the sources with which he is so familiar, a more detailed and connected statement of the introduction and development of the Eyres or circuits of the king's judges. It has always seemed to us that this was one of the most powerful influences at work in directing the course of English institutions into a channel so different from that adopted by the Continental nations, rendering rational liberty possible so much earlier than among other races. A somewhat similar system, devised by Charlemagne in his *missi dominici*, was the most efficient instrument of civilization throughout his vast and incongruous empire, and speedily disappeared in the first dawn of feudalism. Its reappearance in England and the results which it rendered possible would worthily have occupied the attention of one who has shown his ability to gather together all attainable details of trustworthy information.

Mr. Pike has done himself injustice in the selection of a title. His work is far more than a mere history of crime, for though the evil deeds of our ancestors form the staple of the text, it contains a vast amount of curious and novel information respecting their habits and modes of thought, their customs and social institutions, their pursuits and industries, which affords us a most welcome insight into the inner life of the Middle Ages. Nowhere could we point out a more instructive collection of facts on this subject than the chapter devoted to the condition of England in 1348, on the eve of the plague known as the Black Death. Moreover, despite his lack of constructive ability, Mr. Pike occasionally pauses in his recital to give a striking résumé of the leading characteristics of an epoch. Some of these are very effective, such as his description of British life under the Roman domination (pp. 25–30) and the condition of society in the reign of Henry II. (pp. 140–146). These are too long to quote, but a fair sample of his style may be found in the following from his picture of England in the fifteenth century:

"It mattered, perhaps, little that housewives thought as much of long bows and arrows, of cross-bows and bolts, of pole-axes and armor for the defence of their homes, as of furniture for their bed-chambers or fittings for their malt-houses. It mattered little that a letter could be sent from one part of England to another only by a trusty special messenger or by the uncertain hands of a pilgrim or a chapman travelling to a fair. It mattered little that money could not be safely carried in any way from any country town to London, because the roads or paths were infested by thieves. All this was but the ordinary condition of England in time of peace, as that time was called when there were no greater deeds of arms than riots, routs, and affrays, forcible entries, and murders by great gangs of robbers. It mattered not very much that pestilence infected the towns, as pestilence always infects them during wars, for they were so ill-drained and ill-built that they were rarely free from some kind of plague. But worse evils even than these befell the English people during the Wars of the Roses, if we may believe the petition of the Lords and Commons to Richard, Duke of Gloucester, immediately before he became Richard III., king of England. As usual, a contrast was drawn between the great 'prosperity, honor, and tranquillity' of a past time not definitely fixed and the miseries still fresh in the memories of living men. After that bygone period of happiness, always seen as in a mirage, the rulers of the land, it was declared in Parliament, delighted in adulation, were led astray by sensuality and concupiscence, and followed the counsel of persons who were insolent, vicious, and inordinately avaricious. Felicity was turned into wretchedness, prosperity into adversity; order and the law of God and of man were confounded. The kingdom was ruled by terror, justice was put away and despised, and murder, extortion, and oppression took its place. 'No man was sure of his life, his land, or his livelihood, of his wife, of his daughter, or of his servant; every good maiden and woman standing in dread to be ravished and defouled.'"

It may be judged from this that Mr. Pike is no *laudator temporis acti*. In fact, one of the defects of his book is the unconscious exaggeration to which his study of the festering sores of the past has led him. This is, perhaps, a natural reaction from the glamour which a certain school of historians, writing with half-knowledge, have thrown around the Ages of Faith; and their romantic rhapsodies can scarcely fail to provoke antagonism on the part of an accurate scholar like Mr. Pike, whose studies have led him to an intimate acquaintance with the weaknesses, the follies, and the vices of those days. Yet none the less is there error in the unredeemed blackness of the pictures which he paints of age after age, from the Saxon invasion to the close of the fifteenth century. In his pages, kings, nobles, prelates, and churls rival each other in shameless iniquity. The most chivalrous knight is a robber, the merchant is a smuggler, the trader is a swindler, the judge is a perverter of justice for bribes, the lawyer a trafficker in the interests of his client, the priest a compound of the sins of all other classes, the woman, whether a lady of high degree or a humble housewife, is a slave who seeks her liberty in turning harlot.

In fact, Mr. Pike appears to be incapable of the generalizations which would render his deductions from the facts which he has collected valuable as a contribution to the history of human development, while the generalization which consists in making sweeping assertions is easy to him. Sometimes this is done without any facts adduced in its support, as when (p. 319) in describing the terrors of the Black Death he says, "There was no knowledge of the laws of health to give courage in meeting the plague, *no sincere religion to give comfort in death or bereavement.*" Sometimes these general statements are based on manifestly insufficient premises, as when (p. 265) some instructions to investigate evasions of the revenue, in 22 Edward III., are expanded into the general denunciation that "the first thought of the exporter was how he could escape payment of the duty; the first thought of the importer, how he could introduce base money from abroad." Five centuries hence it will be easy for any writer who may industriously examine our statute-books and the dockets of our courts to produce ample evidence such as this that the present generation was utterly abandoned to lying and swindling, to crimes of violence, and to all manner of uncleanness; yet we, who are familiar with both sides of the shield, while we deprecate the evil that exists around us, and strive to diminish it, are fully aware of the coexisting good; and a more philosophical turn of mind on the part of Mr. Pike would have led him not only to admit that all men were not demons from the fifth century to the fifteenth, but to have seen in the very successive laws which he quotes the evidence not only of the evils they were designed to check, but also of the efforts ceaselessly making to aid the right in its sempiternal struggle with the wrong.

It is somewhat curious and, to an American not particularly gratifying, to observe that not a few of the evidences adduced by Mr. Pike to prove a condition of barbarism almost incredible to the modern Englishman, are evils of which we are daily making complaint. When he shows that criminals were habitually pardoned for the reason of state that their services might be secured in wars with France, he evidently is not aware that with us such pardons are frequent to serviceable warriors in the strife of election day When he instances the difficulty of obtaining impartial trials for defendants of rank and station, he evidently cannot imagine that with us, in the full glare of modern civilization, criminals of political influence can almost bid defiance to the laws; and when he alludes to the venality of the bench as an irrefragable proof of the debasement of our forefathers, he shows a lamentable ignorance of the existence of such judicial luminaries as Barnard and Cardozo. If in the mouldy records of the *Coram Rege* Roll he had found an instance, like that of Messrs. Gardner and Charlick, of the reappointment of persons while still under sentence for malfeasance in office, he would have felt himself justified in proclaiming that the people of England were so utterly lost to shame that they preferred criminals to honest men for the most responsible positions, and that they were all irredeemably bad. Low as is unfortunately the tone of our public morality, we know how false would be such conclusions from undeniable facts, and thus Mr. Pike's volume, while invaluable as a collection of historical material, is unphilosophical in its tone and unsafe as a guide.

We shall look forward with much interest to the appearance of the promised continuation of the work, while expressing the hope that the author will see fit to modify the arrangement of his notes and references. He has gathered these together at the end of the volume as an Appendix, without any marks of reference in the text, on the plea that the reader should not have his attention distracted. Had Mr. Pike been writing an historical romance,

this would have been very convenient, as it has proved to be in the Waverley Novels, but his book is eminently one which should have been arranged for the student rather than for the superficial reader, and the distractions caused by continually turning from one end of the volume to the other, not only to ascertain references to authorities, but in hopes of finding additional interesting information upon the subject of the text, is far more damaging to the continuity of the narrative and distracting to the attention of the reader, than merely glancing to the bottom of the page.

Souvenirs de Bourgogne. Par Emile Montégut. (Paris: Hachette; New York: F. W. Christern. 1874.)—Among the French writers of the past twenty years, M. Emile Montégut is not the most conspicuous. The *rôle effacé*, as the French say, which he has been willing to play, has indeed in a measure helped to characterize his gifts. His articles, extremely numerous and various, and treating often of English themes, must be sought out in the back volumes of the *Revue des Deux Mondes*, for he has never thought it worth his while to republish them. We have often wondered why, and have finally concluded that this inflexible modesty is but another form of the subtle fastidiousness which is the most striking quality in his writings. His only large literary enterprise has been a prose translation of Shakspere, but it must be confessed that this is a task of handsome proportions. He has also published French versions of Macaulay's History and of Emerson's earlier essays. His philosophy as a critic and commentator is rather of the pessimistic sort; it is at least a philosophy in which resignation, appreciation, and a kind of mellow stoicism, finding its *point d'appui* in culture for culture's sake, stand instead of certain more boisterous forms of hope and faith. It is difficult to define so peculiar a literary temperament as that of M. Montégut, but the attempt would be worth making for the sake of enlarging our conception of intellectual delicacy. To succeed in it, one would really need our author's own faculty of super-subtle analysis. We most rapidly hit the mark, perhaps, in saying that he is, to our sense, a fruit of pure culture, refined to an intellectual mellowness beside which the inspiration proceeding from genius seems crude and cold. Whether M. Montégut is a man of genius or not is again a case for an æsthetic casuist like himself to deal with, and he lacks, certainly, the more aggressive attributes of talent. He has neither the weight and mass and emphasis of M. Taine, nor the bristling malice—the critical *scratch*, as one may call it—of Sainte-Beuve. Many readers, we imagine, find him tame and dull, and his best friends must be those contemplative minds who care more for the journey than for the goal—more to look out of the window than to arrrive. His characteristic fault is a tendency to prolixity, but this prolixity is so sincere, so suggestive, so charged with information and reflection, that we rarely desire to abridge it. Each of M. Montégut's essays, indeed, reads like a series of excursions from the broad highway; his main idea has generally the lightness and *finesse* of those butterflies of thought which flit across the path of more dogmatic minds, but rarely tempt them so far afield in pursuit. Little by little our author's slow-moving, wide-glancing manner diffuses itself over his subject like a soft autumnal atmosphere—an atmosphere in which the muffled melancholy which resounds through all deep science plays the part of the grey autumnal haze. In this atmosphere we have spent many an agreeable hour, and we have had pleasure in finding it, in the volume before us, as salutary and soothing as ever.

A few years since, M. Montégut published a volume of notes of travel in Belgium and Holland, and showed that he was as ingenious a critic of painting and architecture as of literature and morals. He now follows with a substantial record of a really exhaustive tour of contemplation, we should call it, rather than of inspection, through one of the rich provinces of France—the thrice-historic Burgundy. In a preface animated not altogether rationally by the petulance of wounded patriotism, he offers his fellow-countrymen a plea for their now broad land as a field for the tourist. It now behoves Frenchmen, he says, to shut themselves up from a world which has measured out such scanty sympathy to their disasters and look for consolations at home. "Let us make of Normandy our England; of Provence our Italy; of Béarn and Roussillon our Spain; and let us look for Germany only in those provinces which force has taken from us." If M. Montégut's countrymen in general possessed the admirable tourist-temperament with which he has been gifted, they might certainly discover a limitless source of entertainment and consolation; and if they possessed his singular faculty of suggestive and vivifying description, they would add at the same time to the entertainment of their neighbors. A tourist so redolent of varied culture as M. Montégut is in this indirect fashion, a most agreeable companion; and there is something really affecting in witnessing the contact of a mind infinitely refined, and exquisitely prepared by years of discriminating bookishness, with the material treasures of civilization. In fact, M. Montégut's impressions of landscapes and monuments strike us often like the response of a deep-toned musical instrument to the touch of authoritative fingers. His cultivated imagination gives out in the historic Burgundian atmosphere a kind of constant murmur of appreciation—a tremor of perception and reflection. The book reads like the record of an intellectual holiday; but such only are the holidays of those with whom knowledge is a passion which consents at most to shift its opportunities. Happy the observer who passes on his way with a mind at once so fertilized and so unfatigued by the gathered lore of things, and happy the cities and sites that receive the tribute of so much patient ingenuity, of such a genial passion for reviving and interpreting, cross-questioning ghosts and shadows and echoes, healing and repairing the general injury of time! M. Montégut's volume has suggested to us more reflections than we have space for. Several of these have touched upon the charm of the sort of writing to which his book belongs. We have always been fond of the record of spontaneous personal impressions of the objects which share with ourselves the privilege of dotting the earth's surface, and which differ from us mainly in being but a trifle more passive than we; and these pages confirm our partiality by proving that such a record may be a perfectly graceful vehicle for the most general and most comprehensive reflections. It is true that to manage it well we should possess that combination of qualities which in their high development make the rare originality of M. Montégut—the sense of the artist, the joy in material forms, and the conscience of the moralist, the care for spiritual meanings. Both as connoisseur and as moralist, M. Montégut is equally ingenious and penetrating, equally conjectural, fanciful, adventurous, incapable of remaining inert and irresponsive before *any* manifestation of what was once a living force. Painters will not care for his criticisms on pictures—they will call them too fantastic and far-fetched and literary; and moralists of the sterner sort will not care for his meditations—they will call them too æsthetic, too disinterested, too much tainted with that spirit to which the nature of a creed differs only in degree from that of the ornamental stonework of the church which commemorates it; but we are safe in saying that the "general reader" will find in the 'Souvenirs de Bourgogne' a fund of serious and yet not oppressive diversion.

William Carstares. A Character and Career of the Revolutionary Epoch (1649–1715). By Robert Herbert Story, minister of Rosneath. (London and New York: Macmillan & Co. 1874. 8vo, pp. 385.)—William Carstares is called by Lord Macaulay "one of the most remarkable men of that age"; and Mr. Burton says of him that "except Bentinck, it would be difficult to point out any one whom William [the Third] so entirely esteemed and trusted." Expressions of opinion like these fully justify an attempt to make him better known to this generation; and Mr. Story's own judgment seems borne out by the facts. "That the 'Revolution Settlement' was firmly established in Scotland; that the Union was peaceably effected; that the church, instead of splitting into a number of hostile and fanatical sects, gradually accommodated itself to that relation with the state which at once guaranteed its constitutional freedom and equipped it most efficiently for its sacred work, was mainly owing to Carstares" (p. 368). He goes on in vindication of his task: "For one Scotsman who has heard the name of Carstares thousands are familiar with that of Dundee, though the actual life's work of the one is woven into the very framework of our national being and political constitution, and that of the other has been long since cast into the limbo of unremembered vanities." To remedy this injustice is a praiseworthy aim. Still, Mr. Story is ready to do justice to Dundee. "Among the many false, time-serving, and mediocre politicians of the Convention, his character stands out in a fine light of military genius, personal daring, quick insight, and single-hearted loyalty which almost persuade us to overlook for the time his cruelty as the persecutor of the Covenanters and the harsh instrument of the tyranny of the Privy Council" (p. 169).

Of course the life of a man like Carstares—a clergyman by profession, but a king's chosen counsellor in perplexing relations of state—gives little occasion for the romantic or picturesque features of history. The real subject of the book is the ecclesiastical settlement of Scotland, which had been wavering between Episcopacy and Presbytery for more than a century, and received its permanent organization at this time. Perhaps the most interesting special point brought out here is in the nature of the Episcopacy which was at issue. It was not the liturgy but the prelacy which was resisted by the Scotch. Even the Presbyterians had clung to forms of worship until long after the time of John Knox; while the Episcopal Church of Scotland "was episcopal in government, but no more. It had no liturgy." Further, the resistance to it was quite as much political as religious. Thus Carstares was, like his king, at heart tolerant, and labored earnestly for that policy *in the Church* of Scotland which should "include in the church all who could be comprehended in an orthodox and loyal communion"; but

when it came to Toleration, as a political issue, under Queen Anne's Tory ministry, he could not hesitate as to his position. Toleration was "advocated for the sole purpose of regaining their lost ascendancy to the Episcopalians and Jacobites of Scotland [and the Scotch Episcopalians were almost to a man Jacobite]. A strong and united Presbyterian Church was the foe which they most dreaded; and their efforts were therefore bent to such measures as they hoped would weaken it and split it into factions. . . . The Toleration . . . was in itself an equitable redress of an undoubted grievance; but as the true Liberals of 1687 had resisted King James's toleration then, because they knew that it was advanced for the behoof of the enemies of rational liberty and religion, so now the true Liberals in the Scottish Church withstood a kindred measure proposed with a kindred aim" (p. 328).

A characteristic incident is related of Carstares (p. 108). When passing through London on his way to exile in Holland, in 1635, after having been put to torture in Edinburgh, Lord Melfort advised him to call upon the King as a matter of courtesy. "He told Melfort that, if he were to wait upon King James, he should feel constrained to say several things to him which would reflect but little credit on His Majesty's servants and administration in Scotland, and that the interview could be agreeable to neither. Melfort, on reflection, 'thought it more advisable to dispense with that ceremony.' The less the King heard or saw of Carstares, he said, the better." Mr. Freeman, who somewhere regrets the old English name Aken (Aachen) for Aix-la-Chapelle, would be pleased to see that Mr. Carstares, who spent some time there, always calls it *Aiken*.

History of French Literature. Adapted from the French of M. Demogeot by Christiana Bridge. (London: Rivingtons; Philadelphia: J. B. Lippincott & Co. 1874.)—The manual of Demogeot upon the history of French literature was published twenty-three years ago. It still retains its value as a work not too elementary, for it presupposes a certain knowledge of the subject and abounds in allusions, not always happily introduced, which render it difficult to be well understood by young minds and lessen its utility as a schoolbook. We have it now adapted and somewhat shortened, but not improved. It is questionable whether such a handbook in English is really of use. Those interested in French literature know, or ought to know, French enough to read the original. Allowing that they do not, the work they need is one that will explain to them the unknown literature by some comparison with what they do know. The pleasant little volumes of 'Ancient Classics for English Readers' do this, and are almost all of them good books. But why, as in this "adaptation," quote scraps of untranslated old French (as in pp. 26, 27, 30, 48), why speak of *trouvères, jongleurs, chansons de geste*, without explaining clearly what these words mean as words?

But this "adaptation" has other sins besides those of omission. The first few pages abound in errors. Some are due to the original work, which, published long ago, is not up to recent researches; as when it accepts th spurious Celtic and Iberian fragments of poems which ought long ago to have disappeared from works of instruction; or the now exploded theory about the courts of love; or the fancies of Génin in regard to the authorship and constitution of the Song of Roland. Other statements, too numerous to mention, are the additions of the "adapter." Thus on p. 31 we are told that Gregory of Tours (who lived in the sixth century) described the principal events of the First Crusade in a long Provençal poem. On p. 5 we find the unaccountable statement that "Provençal had been the general language of France until the ninth century, when it made way for the dialect of the North, which we call French." As a specimen of the style, we may quote the following paragraph on the "Influence of Germany" (p. 4):

"From the far North, from the frozen shores of the Arctic seas, from firclad mountains and boundless steppes, came the vast hordes which were destined to put an end to the Empire of Rome. We trace their onward sweep from utmost Asia. Each halting-place became the cradle of a new people. From the scorching plains of India to the snow-covered hills of Norway, a cordon was stretched round imperial Rome; and as she grew weaker and more shrunken, the hardy and vigorous warriors pressed on."

The Physiology of the Circulation in Plants, in the Lower Animals, and in Man. By J. Bell Pettigrew, M.D., etc. (London and New York: Macmillan & Co. 1874.)—Dr. Pettigrew is an anatomist of considerable experience, and the student will find in his book a good many facts of original observation rather chaotically strung together. He will also find a good many original views lamely presented and poorly supported. Thus the author thinks that muscular relaxation is as active as its contraction, and thus explains the suction of the heart. But he omits the crucial experimental proof that a muscle will perform work when stretching. He has also original and vague morphological ideas, and his book cannot be recommended to the beginner, although those who are already expert in biology may find it suggestive.

BOOKS OF THE WEEK.

Authors.—Titles.	*Publishers.—Prices.*

THOREAU. The Poet Naturalist: with Memorial Verse. By William Ellery Channing. 16mo, $2.

"He is every year becoming better known; and his fame, without being noisy or glaring, is growing like a tree in the unnoticed lapse of time. The reception given to this book of Mr. Channing shows this growth of Thoreau in the popular appreciation, and will do something to quicken it. His place in literature will be permanent, and may be conspicuous; if he had written nothing but a few of his poems, he would be remembered with Simonides."—*Springfield Republican.*

Sold by all booksellers everywhere. Mailed, post-paid, by the Publishers,

ROBERTS BROS., BOSTON.

THE WEEK IN TRADE AND FINANCE.

NEW YORK, July 20.

THE week has been an unusually quiet one in Wall Street. The report of a second large fire in Chicago caused only a temporary decline and excitement in the stock market, and seemed to establish the fact that stocks were well held. The attractions at Saratoga drew away a large number of operators, and at times during the last four days of the week business was almost entirely suspended at the Stock Exchange, and the Long Room was turned into a "pool room."

Money on call has been easy at the rates last quoted—2 to 3 per cent., with the larger number of loans making at 2½ per cent. Commercial paper is in good demand at 6 and 7 per cent. for good names having three to four months to run, and extra choice names, running into November, have been placed as low as 5 per cent.

Cable advices report a continuance of easy money in London; the Bank of England rate of discount remaining at 2½ per cent. throughout the week ending Thursday. The Bank lost £209,000 in bullion.

The weekly statement of the New York banks on Saturday was favorable—showing a still further gain of $1,034,000 in the net surplus reserve as compared to that of the previous week. The following shows the changes in the different items going to make up the statement:

	July 11.	July 18.		Differences.
Loans	$287,088,400	$285,315,000	Dec..	$1,773,400
Specie	27,375,400	27,755,300	Inc...	379,900
Legal tenders	61,335,100	61,853,700	Inc...	518,600
Deposits	243,525,600	242,983,600	Dec..	542,000
Circulation	25,923,700	25,727,500	Dec..	196,000

The following shows the relation between the total reserve and the total liabilities:

	July 11.	July 18.		Differences.
Specie	$27,375,400	$27,755,300	Inc..	$379,900
Legal tenders	61,335,100	61,853,700	Inc..	518,600
Total reserve	$88,710,500	$89,609,000	Inc..	$898,500
Reserve required against deposits	60,881,400	60,745,900		
Excess of reserve above legal requirements	27,829,100	28,863,100	Inc...	1,034,000

The stock market has undergone frequent fluctuations though quite unimportant, the market closing on Saturday at about the quotations current at the beginning of the week. The Northwestern and St. Paul stocks are rather feverish owing to the unsettled question of the right of the State of Wisconsin to interfere with railroad tariffs, which question, it is now said, will come up for argument before the U. S. Supreme Court in October; meanwhile an injunction has been applied for in the State Courts to prevent the railroad companies from violating the law. On Wednesday a very sudden decline was made in the market owing to the large fire in Chicago. The news, as first received, was well calculated to throw the market into a panic, but holders wisely concluded to hear more about the fire before selling, and subsequently, when it was known just what the extent of the damage was, a very sharp recovery was made. The leading subject of conversation has been the payment of an August dividend upon Lake Shore. The recent statement published by the Company was certainly not encouraging to those who hope for a dividend, as the net profits, after deducting interest, were not sufficient to pay 4 per cent. to the stockholders. The statement, however showed an increase in net earnings as compared with those of last year for a corresponding period.

There has been a better demand for some of the investment stocks today; Lackawanna sold at 107½, New Jersey Central at 106, and Chicago, Burlington, and Quincy at 105½.

The following shows the highest and lowest sales of the leading stocks at the Stock Exchange for the week ending Saturday, July 18, 1874:

	Monday.		Tuesday.		Wed'day.		Thursday		Friday.		Saturday		Sales.

Government bonds have been strong, and prices have improved. The *Financial Chronicle* says, in relation to the bids for the new 5's to be opened on the 23d inst.:

"It appears at present as if there would be quite a number of small bids from home purchasers, but what the heavy men will do—the foreign bankers—is not yet known. It is rumored that a combination has offered to take $25,000,000, or according to another report $50,000,000, on certain conditions as to an option for the balance, or with an agreement that no more of the bonds should be offered by the Secretary within a specified time. The details for bidding and completing the exchange of five-twenties for the new bonds seem to be imperfectly understood. Bidders will have 90 days from July 23 to pay for bonds, but if they take them up any time before the 90 days expire, 90 days' interest must be paid in addition to the interest accrued to July 23. The subscriber for an exchange of bonds will be charged the interest on the bonds for 90 days from July 23, whenever he takes them; but he will also be credited the interest on his five-twenties for the same time."

It is reported that the State of New York, having been unable to buy up a sufficient amount of its Bounty Loan bonds, will make a bid for a large amount of the new 5's for the purpose of investing the money which the Treasurer has on hand for the purchase and cancellation of its own debt.

The following are the closing quotations this evening:

	BID.	ASKED		BID.	ASKED
Registered 6's, 1881. c.....	118	118⅛	Registered 5-20, 1867, c.....	117⅜	117⅝

IMPORTERS AND PUBLISHERS,
17 Murray Street, New York.

HAND-BOOK OF BIBLE GEO- graphy, containing the Name, Pronunciation, and Meaning of every Place, Nation, and Tribe mentioned in both the Canonical and Apocryphal Scriptures. By Rev. George H. Whitney, D.D. Illustrated by nearly one hundred engravings and forty maps and plans. Four hundred closely printed pages. New edition, revised and corrected to date. Price, post-paid, $2 50.

NELSON & PHILLIPS, PUBLISHERS,
805 Broadway, New York.

Just Published by

ESTES & LAURIAT,
143 WASHINGTON STREET,
BOSTON.

ATHERSTONE PRIORY. By L. M. Comyn, author of 'Elena.' 1 vol. 16mo, cloth, $1.

*** "A quiet yet charming English romance of real life. The scenes are life-like and the story interesting. The heroine at once wins the sympathy of the reader, which soon deepens into admiration, and an intense interest in her fortunes and misfortunes."—*The Examiner.*

MEMOIR OF THOMAS, FIRST Lord Denman, formerly Lord Chief-Justice of England. By Sir Joseph Arnould, late Judge of the High Court of Bombay. Published uniform with Campbell's Lives of the Chief-Justices, and making volumes five and six of the Series.

2 vols 8vo, tinted paper, cloth, bevelled,	$7 00
" " " sheep,	9 00
" " " half calf,	12 00

The above, or any book published in the United States, sent, post-paid, on receipt of price, when not to be had at the local book-stores.

The Nation.

NEW YORK, THURSDAY, JULY 30, 1874.

The Week.

MR. BRISTOW has kept the financial world during the past week in a state of irritating suspense about his loan. On the 2d of July he issued a circular calling for bids for the whole or any part of the loan up to the 23d in sealed proposals. As the object of the loan is to convert the six per cent. bonds into fives, it was of course not open to him to accept less than par, and the competition was therefore to determine what better than par could be attained. The plan is semi-popular in its character—that is, it put aside the Boutwell machinery of private contracts with syndicates and went into the general market. But the difficulty at once presented itself that the number of bids from investors who wished to hold the bonds could not be expected to be very large between the 2d and 23d of July. People who buy bonds for investment take some time to make up their minds, and need to have the process of getting them and the advantage of getting them explained to them by somebody in whom they have confidence. Moreover, they are not likely to take the trouble of sending in "sealed proposals" to the Treasury and security for execution of their engagements. This whole process looks formidable and complicated to the average investor. From this source, therefore, the Secretary was not likely to receive many bids under the proposed conditions. The only other source open to him was the bankers, home and foreign, who buy bonds wholesale for the purpose of retailing them at a profit. But these gentlemen do not like to take part of a $179,000,000 loan without having some guarantee as to the price and time at which the remainder will be sold; so that their bids, unless a syndicate took the whole, were almost certain to have tacked to them, as a condition, a right of "call" on the remainder of the loan. The result has been, in fact, that home bids for only about $10,000,000 have been positively accepted, and the Messrs. Rothschild of London and J. & W. Seligman & Co. of this city have taken $45,000,000 at par, minus ¼ per cent. commission, with a "call" on the remainder any time during six months, and they assume all expenses. There is little doubt that this will eventually dispose of the whole loan.

The National Board of Underwriters has caused a report to be made on the condition of the Fire Department of Chicago, by a special committee appointed for the purpose, and as usual it brings us at once to the canker-worm of all American institutions. The Department, it says, is under the control of a board of four persons called the "Commissioners of Police and Fire," three of whom are elected by "the people," and one appointed by the local authorities on the nomination of the local board of underwriters. But as police matters are deemed more important than fire matters, five-sixths of the time of the board is given to the former and only one to the latter. The direct management of the Fire Department is left to the Chief Marshal, who nominates for all vacancies, *subject to the confirmation of the Board*, and, as might be expected, "the appointments are mainly made for political services, the Chief is besieged by politicians in behalf of themselves and their friends, and prevented from giving the necessary attention to the details of the department which discipline requires." The fire wardens, too, have to report to him, and if they lodge a complaint against anybody, the politicians swarm up to prevent any action being taken. The discipline of the department is bad. The men lounge about the doors of the engine-houses, smoking and sleeping, without uniform. Officers are not distinguishable from privates by any outward sign, and no respect is paid them by their subordinates. They are not saluted, or obeyed with any alacrity. The street patrols are not obliged to give any account of their time. The fire wardens are mainly occupied with "politics." The telegraph wires are carried over the roofs of houses instead of on poles. But the supply of water is very good.

Upon receipt of this report, the Board of Underwriters acted promptly, by passing resolutions recommending the fire insurance companies to take no more risks in Chicago after the 1st of October next, (1) unless permanent fire limits are established conterminous with the corporate limits of the city, and suitable persons are appointed to enforce within these limits the laws relating to the erection of wooden buildings and the exclusion of dangerous manufacturing establishments; (2) unless a stringent building law is passed and enforced by a suitable bureau; and (3) unless there was at once a complete reorganization of the fire department under a board of commissioners or a competent head, specially charged with its care; the eradication of the political element from it, and the subjection of the men to military discipline; and the organization of a corps of sappers and miners. We thus see from the example of Chicago and Boston that it costs an American city from $100,000,000 to $200,000,000 to get the politicians out of one department of the municipal government, and this may serve to give us an idea of what it will probably cost to get them out of the Custom-house, the Post-office, and the Treasury, to say nothing of the State administration. These sums would erect a good building in a healthy situation in either city in which ten thousand politicians could be lodged in winter, or would take them to the seaside in summer, and the interest on the remainder would supply them, their friends and relatives, with wholesome food and tobacco and pure whiskey in reasonable quantities, besides two suits of black clothes apiece during the year, which is all they ask; and the decent people of the country would be thus left free to conduct the Government with efficiency and respectability.

The kidnapping of a child in Philadelphia, nearly a month ago, though it was at first received with more coolness by the public and police of that city than by the rest of the country, has at last led to the offer of $20,000 reward by the Mayor for the recovery and the detection of the kidnappers. A New York gentleman of "ample means," who says the story is making his invalid wife insane, also offers $20,000 for the recovery of the child and no questions asked, through the *Herald* of this city. Up to the present moment, however, nothing has been heard of the child in spite of the exertions of the police and the vigilance of the people. The fact that the father is a man of moderate means, in embarrassed circumstances, and that his wife since the child's disappearance has been passing some of her time at a watering-place, has supplied a correspondent of the *Herald* with the materials for a theory that the affair was probably what the police call "a put-up job"—that is, that the parents were privy to the theft, and even devised it as a means of extracting money from friends and the public to be used in extricating the father from his difficulties. It is certainly extraordinary that clever kidnappers, having their pick of children, should have selected the son of a poor and insolvent man for their first attempt. But there is not much comfort for the public on either horn of the dilemma, because it would be nearly as bad to have popular credulity practised on in this way as to have children successfully held to ransom, inasmuch as the success of an attempt at fraud would prevent vigilance or indignation when a *bona-fide* case occurred.

The success of kidnapping in some countries of Europe makes one wonder that, considering the growth of the Granger movement in America, it has not been practised more extensively here. There has been a revival of it of late in Italy and in Sicily, where it is turned to excellent account by the Grangers of those countries who farm on the *métayer* system, or as we say on shares. As the landlord has to go out to his

farm every fall in order to take account of the crop and collect his dues, the happy thought has occurred to the tenants of scaring him to such a degree that he won't come. This is done by capturing him, carrying him into the hills, and holding him for a ransom. In Sicily, according to the last accounts, land-owners now only visit their farms under a strong escort of cavalry, and some prefer surrendering their rents to running the risk. In the West, the same thing is accomplished by more decent means, as the Grangers have the law-making power. Instead, therefore, of putting a stockholder or bondholder in bodily terror, so that he shall not visit his road and collect fares or charges, they fix the charge to suit themselves, and denounce him as a law-breaker, and threaten him with fine and imprisonment if he murmurs or resists. The Governor of Wisconsin fired a salute of one hundred guns the other day on receiving the news that the victims of that State could get no redress in the courts, much as Sicilian brigands would let off their carbines with joy on hearing that the prisoners' friends had given up all hope from the police and that the ransom was on its way.

The Tilton-Beecher case has had added to it since our last issue a statement from Mr. Beecher, contradicting certain assertions of Tilton's and promising to explain his own letters in detail to the committee; also a statement from Mrs. Tilton, contradicting and severely denouncing her husband. The committee has likewise published an official report of the cross-examination of Mr. Tilton, filling three pages of the newspapers. None of these documents, let us say, throw any light on the question. Mr. Beecher's statement contributed nothing to a solution beyond his admission that the letters cited by Mr. Tilton were genuine. Mrs. Tilton's letter was a simple denial, rather incoherently expressed, accompanied by some sad revelations of domestic misery. The publication of Mr. Tilton's cross-examination by the committee was, we will not say inexcusable, but wholly unnecessary, for reasons we have given elsewhere, and it is too bad that it should be thrust on the public attention. We must remind the committee that Mr. Tilton is not on his trial. If the time devoted to cross-examining him had been spent in examining Mr. Beecher, we might ere now have reached the end of this unsavory affair. The libel suit brought against Mr. Tilton on Tuesday by a reporter employed on his semi-official organ, the Brooklyn *Argus*, only adds to the persistent mystification of which the public is beginning to be excessively weary.

Missouri political affairs are not now very attractive to outsiders, the Democrats seeming to have things much their own way, though the general public would be interested enough should it appear that the chops and changes of politics might bring round to Senator Schurz a chance to keep his place in the Senate. The State Democratic Committee have just issued an address, in which, among many things neither very instructive nor very entertaining, they make a curious calculation that Missouri is henceforth to be even overwhelmingly Democratic. They point out that in 1872 Missouri polled, in round numbers, no more than 277,000 votes, while Indiana, with a smaller population, polled a hundred thousand more—377,917. The committee therefore estimate the reserve vote of Missouri at 100,000, which in '72 was not put into the ballot-box because of the disgust inspired by recollections of the old registry law, but which they think will be sure to be brought out now. They think, therefore, that they may fairly count this autumn on about 135,000 majority for the Democratic State ticket. We should advise them, however, not only to bring out the disaffected on election-day, but previously to make a study of the operations of their brethren in Indiana along the southern tier of counties; and also of those of their Republican friends along the interior lines of railroad; and they will find that there are many ways of getting full returns out of a population no larger than that of Indiana in 1872, when for about every four and a half men, women, and children in the whole State, there was one voter either for Mr. Morton or for Mr. Hendricks. The committee have little to say besides these and similar words of encouragement to the faithful. To the "hard-money, home-rule, free-trade" Democracy they give as little comfort on the first point as most of the Western committees and conventions. They speak most plainly about the Grangers and the taxation of the bonds, declaring the party "opposed to the system by which a large portion of the wealth of the county is exempted from taxation." As for the Grangers, the party, they are told, approves of them, recognizes their principles as Democratic, and invites them to come under the friendly banner. The home-rule and free-trade planks of the Eastern Democracy the Missourians are gratifyingly clear for; but the other plank they draw back from. Two Democratic county conventions, by the way, in Ohio have just pronounced for inflation and easy business, and it looks as if there might be need of the best-instructed of the Eastern members to teach financial rudiments for one more winter.

It appears, in spite of the entire failure of the Republican Congressional Committee to "let on," as they say, that there ever was any such place as South Carolina, that the purification of the politics of that State is nevertheless to be done "within the party"—*i. e.*, the Republican party, which, as the St. Paul *Press* says, has become what we see it to-day by a process of historical evolution along a path of development marked at every step with the immortal witnesses of the high and noble purposes which have controlled it. Congressman R. B. Elliott, chairman of the State Central Committee, does not feel himself strong enough to call names, and probably there is no one member of the committee whose house is not mostly composed of glass, so that the address which they have just put forth is not so exciting as it might be. But to the officials who at present have the State in their hands it may mean a great deal more than its mealy-mouthed phrases convey to a Northerner; for, in brief, it conveys to these officials a threat or a warning that the Northern wing of the party is sick of them, and that the weight of Federal influence, and perhaps patronage, will henceforth be thrown against them. If so, something will be done, perhaps done too late, which two or three years ago might have been very effectual against the robbers. Now, it may suit Moses and his friends to be less tractable. Among the new reformers we observe one or perhaps two of the well-known name of Mackey, and we see that one of them recently took home the tidings from Washington that he had been significantly asked at the White House why Moses was not impeached and removed. This goes for corroborative evidence as to the disposal of the Federal power during the forthcoming contest, and it sharpens and brightens all eyes and ears in the reform camp. One of the Mackeys is a judge, and he is reported as thus addressing from the bench a negro convicted of petty larceny:

"I could send you to the penitentiary for several months; but were I to do so you would be in bad company, and besides, the Governor might possibly pardon you in a few weeks, and that would disgrace you. I will put you in better company than you would find in the penitentiary by sending you to the county jail for one day; and let this be a warning to you, for should you again be convicted of a similar offence you will go to the penitentiary and have to remain, as we will then have a governor who may not so freely exercise the pardoning power."

On the whole, it does not seem at this distance that there is much to choose between the eloquent Elliott and the less eloquent Cain, or that any but sanguine people need hope that a substitution of Mackey for Moses will effect any good for South Carolina. The evil lies too deep to be cured in a minute, and the State has probably a desperately hard political road before her.

Brady, the sailor, and sometime third mate of the lost steamer *Atlantic*, who was on board the *Pennsylvania* steamship when all her officers were swept overboard but one, and who then took the command and brought her into port, has been suing the Company for salvage, having declined a present of $1,000 which they offered him. The District Court, Judge Cadwallader, has awarded him $4,000; and in doing so decides a very nice point—whether a passenger who exerts himself both to save the ship and his own life can be safely and fairly admitted to the rights of a salvor. The objection to it on

grounds of expediency are obvious. If the rule were well established, it might convert passengers in times of great difficulty and danger into intriguers against the credit and authority of the officers who would make their exertions for the common safety a matter of bargain at the critical moment. Brady's case differed from that of the engineer who saved the *Great Eastern*, in that the latter was employed or requested to act by the captain, while Brady simply obeyed the necessity of the case in the absence of the captain. The decisions, however, all run against the passengers' right to salvage, and Brady's exploit was too peculiar to make his success of much consequence as a precedent.

The season has been noticeable for calamities by water, some due to human carelessness or ignorance, and some, if we may say so, to the visitation of Providence. The two disasters in Massachusetts, the lesser one in Connecticut, and the so-called waterspout at Eureka, Nevada, which destroyed several lives and much property, were followed on Sunday last at Allegheny City, a suburb of Pittsburg, Pa., by a flood second only to the flood at Mill River. It had one circumstance which heightened the fear and horror to a point above that of the Massachusetts calamity, for it occurred in the night without even a gaslight to assist the victims to escape, the gas-works being ruined, and it came without warning. Briefly described, what happened appears to have been this: Allegheny City has behind it high, amphitheatrical hills, down from which go toward the river some "runs," the waters of which have gradually eaten out the earth of the hills, till now the runs are precipitously banked. Into these from the sides flow similar streams, usually of petty size. As one of these runs, called Butcher's Run, approached the city, houses of the tenement order occupied its banks, and still further on its usually scanty stream was bricked over and confined to a sewer. For many years it has made no trouble except when it became fetid. But on Sunday night the storm, which visited the city in the day-time, became much heavier, though not so much so as to alarm people, and the inhabitants went to bed in security, the rain, indeed, preventing the sense of danger, for its noise blended with that of the waters. When these came down, which they soon did tremendously, they seem to have proceeded as far as they could freely, then built a dam of *débris*, then overcome this with a crash, then built another, and so gone on to the end. Many houses are swept away, and the loss of life is reported at nearly two hundred. Pittsburg is supplying the needs of the sufferers.

The International Congress of which we spoke last week has met at Brussels, and Baron Jomini has been elected president. Nothing new has been reached with regard to the programme, and nothing has occurred as yet to indicate the probable result. Any agreement that can be reached providing for the more humane treatment of prisoners and wounded will, doubtless, meet with general approval; or, in other words, the philanthropic part of the programme will probably be a success; as much cannot be said about the proposed modifications of international usage. Of these it may be said, in general terms, that they are favorable to non-maritime powers with large standing armies. It is for their interest, for instance, that persons not embodied in the regular military force should be forbidden to rise on an invader, and that private property should be respected at sea. The probabilities are, therefore, that while receiving strong support from Russia and Germany and Austria, and the smaller powers who have little interest either way, they will receive none from France or England.

Public opinion in England seems to cling to the right of capturing enemies' vessels at sea as necessary to secure the full advantage of English naval superiority, but now there is another side to this question, as is well shown by an article in the *Revue des Deux Mondes* of July 1, by a captain in the French navy, M. Aube, in which he maintains that the true policy for France to pursue is to abandon the task of creating a great iron-clad navy, in which she cannot compete with England, and which in time of war would be of little use to her, and confine herself to equipping fast frigates for the destruction of the enemy's commerce. He says that England's enormous heavy navy secures her against invasion, but her life depends on her commerce. More damage can be done to her through her commerce than in any other way, and how much might be done by light cruisers the career of the *Alabama* shows. He cites in support of this view the fact that the United States with no navy did not hesitate to urge the *Alabama* claims in the strongest way, and Great Britain evidently felt all through the controversy that the United States had the advantage of her in case the dispute was not settled peaceably—a direct result of the *Alabama* depredations. He points out too that the French iron-clad fleet was of little or no use during the Franco-Prussian war, having been employed solely in blockade duty, which lighter ships would have performed just as well. From this point of view, it is clearly the interest of powers whose foreign commerce is large to have private property at sea declared inviolable, whatever the strength of their fleets may be.

The bill for the Regulation of Public Worship introduced in the House of Lords by the Archbishop of York has made its way down to the House of Commons, where it meets with vigorous opposition, led by Mr. Gladstone. His objections to it are that while it proposes to enforce uniformity of practice, it leaves discretionary power in the hands of the bishops, which would either be used to compel uniformity or it would not. If it were so used, it would in a few weeks plunge all England in excitement, because it would compel the Low Church clergy to revive practices which would be just as offensive as many of those which the Ritualists have revived, and it would disturb parishes in which worship has been peaceably and profitably conducted for generations, with harmless peculiarities of ceremonial not in use elsewhere. In short, the Liberals, both in church and state, seem unwilling to entrust the bishops with the proposed power, and demand that if there is to be any legislation on the subject, it shall define rigidly what the ritual of the Church of England is to be, and leave little or nothing to anybody's notions of propriety. One of the defects pointed out in the measure was that it left bishops free to conduct service in any manner they pleased if they were not incumbents of parishes. To the world outside the church the debate has been mainly interesting as indicating the increasing difficulty experienced by the state in regulating the church, and thus the consequently increasing strength of the tendency to separate them.

Mr. Forsyth, who is the father of the bill now before the English House of Commons giving the suffrage to unmarried female taxpayers, presided recently at the annual meeting of the National Society for Women's Suffrage in London, and reported progress. It appeared that 161 members of the last Parliament, who were previously favorable to the bill, have been returned in this one, and 72 recent converts. Of the opponents of the movement in the last Parliament, 117 have lost their seats, and so have 77 supporters. Mr. Stansfeld also spoke, and Miss Cobbe, who "castigated" Goldwin Smith, and Lord Talbot de Malahide, Mr. Arthur Arnold, and Mr. Jacob Bright. The meeting was mainly composed of ladies, but the gentlemen did most of the speaking, and, we need hardly say, spoke highly of women. Mr. Forsyth said "the argument of intellectual inferiority" had been abandoned, and Lord Talbot de Malahide, who is an Irishman, went further and said that women were the most intelligent portion of the community. Mr. Forsyth apologized for abandoning the effort to secure the suffrage for married women, and explained that he only did so because he saw it would imperil the bill, for which, however, there is no chance this session. There is nothing new about the movement in this country. The preponderance of opinion is against the probability of its success at the approaching election in Michigan, where it will doubtless be seriously injured by "The Brooklyn Scandal," in which so many of its ardent supporters are prominent actors, and are now all unbosoming themselves to the reporters.

DOES THE CURRENCY BILL CONTRACT OR INFLATE?

A WELL-KNOWN story tells us how an old man ascertained by various experiments the impossibility of pleasing anybody, even about so simple a matter as the driving of a donkey. But then he lived before the days of conference committees. Congress, in its last piece of legislation, appears to have found much better fortune. It passed a bill which suits, and which ought to satisfy, both the inflationists and their opponents. For the former discover in the measure an expansion of more than fifty million dollars; while the latter, according to an estimate printed in a leading newspaper of this city, are to be comforted by an indirect contraction at least twice as great.

Study of the act by which our law-makers have afforded us an exact gauge of their capacity and desires in monetary legislation, only strengthens our first impression that the final efforts of the inflationists were planned with ingenuity and rewarded by success. Whenever a section of the bill showed a tendency to produce contraction, it was balanced in another section by some provision of an opposite drift. Thus Section 4, which facilitates the withdrawal of national-bank notes, is offset by Section 2, which increases the profit upon circulation to the extent of nearly one-half per cent. per annum in the case of country banks, of seven-eighths per cent. in the cities of redemption, and of as much as one and three-quarters per cent. in New York. The gain is greatest where it was most needed—with the banks which placed the least value upon their circulation as it stood.

The direct inflation caused by the act is of course $26,000,000. This sum has been made a permanent addition to our legal-tender money. Nor does it affect the force of the expansion that the notes were already outstanding. But for the 6th Section of this act the condition of the Treasury would have warranted, and even compelled, the gradual withdrawal of every dollar of overissued greenbacks during the current fiscal year. The process would have caused little disturbance and less suffering. For the issue, until Congress endorsed it, was barely more than nominal. The notes emitted by authority of Mr. Richardson remained even to the end distrusted and unused. Some of them have been regained by the Government, and added to its currency reserve. The rest have gone back to the Treasury, where they are locked up in trust for the banks. The return made to the Comptroller of the Currency on May 1 exhibited an increase of $21,525,000 in the legal-tender notes represented by U. S. certificates compared with the amount deposited at the corresponding date in 1873.

The change which the act produced in the status of the "illegal tenders" will be realized by a moment's consideration of a single point. The motion to reduce the outstanding greenbacks to the lawful 356 millions found very little support either in the Senate or in the House. What would have been the fate of a proposition to contract the issue below that normal amount? Could it have expected the compliment of a vote? Hardly. The boldest advocate of honest money in Congress would have received the suggestion with a shudder. Yet now 382 millions stand where 356 millions stood then. The field of our next battle lies beyond them.

The indirect inflation caused by the abolition in Section 2 of every vestige of reserve upon circulation, is greater than the direct increase of currency established by Section 6, and is just as positive an expansion as the issue of so many additional notes. Its extent, calculated according to the latest report, and on the supposition of the withdrawal by the banks from their redeeming agents of an amount equal to the entire released reserve, will be as much as $36,170,242, distributed among the different classes as follows:

Gain of country banks	$35,457,350
Net gain in cities of redemption	3,020,831
	$38,478,181
Less net withdrawal from New York banks	2,307,939
Total expansion	$36,170,242

This, remember, is the minimum enlargement—the smallest increase contemplated by the authors of Section 2. But we can safely predict that the redeeming agents will not be called upon for the whole of the released reserve, or anything like it. So unprofitable a demand is scarcely imaginable, even as a possibility. If the distribution continues according to the present proportion, the indirect inflation will rise to $55,051,565, apportioned thus:

Gain of country banks	$35,457,350
Net gain in cities of redemption	14,232,479
Net gain of New York banks	5,361,736
Total expansion	$55,051,565

It has been said that the banks, remembering their experience last September, will decline to avail themselves of the permission so unwisely given to weaken their reserve. Whether they refuse the privilege or accept it, their decision cannot alter the character of the act. On what ground do men venture who expect self-denial from the banks? What was the lesson which the panic taught? Was it not that the strong banks will support the weaker ones at the expense of their depositors and the risk of their credit; that, when the pinch comes, the rash and the prudent occupy the same footing with "pooled" resources and a common fate?

While the expansion induced by the section we have considered is thus large and indisputable, the contraction of the currency which has been claimed as the indirect outcome of other provisions of the act cannot be considerable, and may prove imaginary. The estimate already mentioned, which was published in one of our city papers as having come to it from Washington, rates the amount of this contraction at $117,000,000. If the computation had not been widely copied, it would be unworthy of serious criticism. No financial statement more absurd than the figures which it gives emanated from the Capitol through all the recent Congressional discussion, and this it will be admitted is saying a great deal. The very first item of the estimate credits the 5 per cent. deposited against circulation with producing a contraction of $17,000,000, because, to use its own words, "that amount of legal-tenders will be irrevocably withdrawn, so long as the national banks keep their notes out." Now, whether these greenbacks are held by the Treasury or locked up in the vaults of the banks, cannot possibly make the slightest difference to anybody. In either position, they form the bottom of the reserve. We may note here, but rather as a curiosity than as a matter of importance, that the provisions for redeeming the circulation do really involve a slight expansion, instead of the contraction erroneously claimed for them. The Treasurer of the United States is required to redeem bank-notes on presentation. But he is not obliged to notify the issuing institutions before the first day of each month. Thus, to some extent, greenbacks will be released for a season, and national bills will take their place in the reserve to secure deposits.

The estimate assigns a further contraction of $20,000,000 to represent "additional balances which will be retired by the country banks." Yet should these institutions draw upon the cities of redemption for the 5 per cent. which must be kept in Washington, and should the cities of redemption in their turn take their entire provision for circulation out of New York, the act will still leave all the classes far better off than it found them—that is, with much more money to employ. The country banks will gain a little more than thirty-five millions, the cities of redemption a little less than ten millions, and the New York banks very nearly four millions. Among them all, the total increase of usable money will amount to quite forty-nine million dollars. Let us carry our illustration a step beyond this. Even in the extreme supposition that New York will be called upon to supply the cities of redemption with greenbacks, not only for their deposits in the Treasury, but to replace the legal-tenders required from them by country banks, its available funds will not be noticeably diminished, although the expansion in the cities of redemption will be materially increased. A calculation made upon this basis shows that the country banks will gain, as before, something over thirty-five millions; and the cities of re-

demption almost exactly nineteen millions. The decrease in New York, on the other hand, will be barely three millions; and the net increase of usable money, among all the classes, will rise to fifty-one million dollars.

The estimate proceeds by putting down $10,000,000 for "currency in transit to and from redemption centres." It might have guessed a hundred millions with as much reason, because the total amount of bills of other national banks held by all the banks in the United States, at the date of the last published return, was only $20,636,358. A further contraction of $20,000,000 is credited to the Treasury as an increase of its working balance, "necessarily made heavier because the reserve to be drawn upon in emergencies is abolished." We might reply that the reserve never existed outside the fancy of a foolish Secretary; for the last clause of the 6th Section of this act exposes the absurdity of the pretence that "retired and cancelled" greenbacks were intended to be a permanent resource. Congress, although it lacked bravery to blame a Cabinet officer, put its foot down very heavily upon Mr. Richardson's pet idea. We object, however, for a better reason. The "reserve" was never needed by legitimate fiscal demands. It was employed on one occasion to a small extent for political effect, and at another time more freely to relieve the money market, or rather to replace funds which had been used with that intention. But, as a provision exacted by the necessities of the Government, not a dollar of it did service—ever.

The currency now in the Treasury exceeds the sum held at the corresponding dates in 1871, 1872, and 1873, as well as the average amount on hand for either one, two, or three years back. Beyond dispute, the Secretary has the power to increase his balance materially. Such a course is unnecessary; it would be very unpopular with men whose clamor is quite certain to get a hearing, it would defy alike the spirit of the law and the policy of Congress, and that he will adopt it any one who chooses may contend.

To the items of contraction we have noticed the estimate adds $50,000,000 for "national-bank circulation likely to be retired in excess of the legalized new issue." This is explained by the statement that the profit has been so reduced through charges of redemption as to create "a strong tendency among the banks to abandon their circulation, while they can avail themselves of the present high prices for Government bonds." We have already shown how the abolition of the reserve offsets the cost of redemption, and leaves circulation at least as profitable as before; as to the second point, the current quotations for United States securities are not higher than usual. They rule indeed rather under than above the average. Besides, Government bonds move with the premium on gold. Their holders are justified in parting with them only when gold is a good short sale. We submit, therefore, in view of recent events, that the premium upon the precious metals will not be destroyed suddenly or even soon. The banks which retire circulation will only increase the income of institutions which retain it. The net withdrawal in excess of the additional notes taken up by new banks ought not to be large, even on the unnatural money market now existing. There is, however, fair ground about this point for an honest difference of opinion. We think that the contraction caused by this withdrawal will be inconsiderable and of brief duration. The reasons which we have given for holding this view appear strong enough to justify us in expecting that the future will confirm it.

MacMAHON AND THE ASSEMBLY.

THE situation in France has passed into a new stage, by the announcement of Marshal MacMahon that he will under no circumstances surrender his power until the end of his term of seven years. He has made this announcement distinctly in a message to the Assembly. He has made it no less distinctly, and in fact somewhat menacingly, in his general order to the army at the close of the late review. This shows a monarchical restoration to be impossible at present, and very unlikely in the future, so far as the Comte de Chambord is concerned. All delay tells against him, or would tell against him if his own utterances had not made his case hopeless. It is by no means so troublesome to the Bonapartists, who really are not yet ready for action, owing to the youth of their candidate and the nearness of their disasters. It would be perfectly satisfactory to the Republicans if they could get the Republic formally proclaimed or a republican constitution adopted, and if they could get rid of their vague fears that the Marshal may yet be guilty of some stroke in the monarchical interest. They are accordingly fighting either for a dissolution of the Assembly or the adoption of a republican constitution. The obstacles to the dissolution of the Assembly seem trifling, but they are in reality strong. A parliamentary body armed with sovereign power, and which nobody has any authority to dissolve, is of course something anomalous. Any such body is very unwilling to put an end to its own existence. The only body like the French Assembly of which we have any knowledge was the Long Parliament, and it sat until it became an object of contempt, and would have sat longer if the army had not turned it out of doors. Members of such an assembly naturally love power, and their numbers make them insensible to public opinion, particularly when they know that their chances of re-election are small. Moreover, when they are paid, as they are in France, and a large number of them are needy men, self-interest in its lowest and coarsest form comes to the support of the ordinary fondness for office. A great many of the most public-spirited and enlightened men in the French Assembly, too, while fully sensible of the political impropriety of this prolonged hold on power, are afraid to dissolve without having created any regular machinery of government. To dissolve, not knowing what is to follow, would seem imprudence in any country. In a country like France, in which, as has been said, the unforeseen is always the most likely to happen, it seems to many of the soundest heads sheer madness. The prophets of the Left are of course ready to guarantee the return of a patriotic and enlightened Republican majority; but then if these gentlemen proved mistaken, it would not be for the first time, and a mistake might prove irretrievable. Those who talk most glibly about the hold of the Republic just now on the public mind in France know well enough that the public mind is fickle, self-distrustful, and given to panics. If the Assembly were to dissolve to-morrow, and disorders of a serious character occurred anywhere during the interregnum, there would be no telling what kind of a majority would be sent up. It might be Republican, but it might and probably would be something else—say Bonapartist. As long as no form of government has been established, experiments constantly suggest themselves to terrified voters. A more striking illustration of the folly of looking for devotion on the part of the French public to any particular system of government under trying circumstances than was afforded by the resurrection of the Legitimists in 1871, could hardly be desired. Therefore, the Moderates in the Assembly shrink from dissolving when dissolution will leave nothing standing but MacMahon and the army.

Besides, from the radical difference of opinion in the Assembly as to what form of government ought to be set up, the Conservative Republicans, no less than the Monarchists, dread a republic with one Chamber only. The objections to it to be found in French history and French character are too numerous to mention. Everybody acknowledges their existence and their force. But there is no general agreement as to the mode of creating a Second Chamber. The country has been swept clean of all sources of political strength except popular election and the control of the army. There is no aristocracy with roots in the soil or in popular affection or respect. There are no organizations like the States in this country, with sufficient vitality and independence to enable them to create a strong senate. A senate elected by the popular vote would not differ materially in character and tone from the lower chamber, and would therefore have little or no value as a break on popular impetuosity or as a reviser of hasty popular decisions. An upper house, nominated by the executive, like the old Chamber of Peers or the Bonapartist Senate, has been proved to be weak and con-

temptible. There are countries in which such a body might have a chance of success. In France, in which a lampooner like Rochefort may rise in six months through successful buffoonery into the rank of a statesman, no care in the selection could give it permanence or strength.

It will thus be seen that the situation is one full of difficulties, before which the most enlightened and patriotic men may well hesitate, and which the selfish and dishonest are only too glad to parade as an excuse for doing nothing. We said some weeks ago that the result of the embroglio would probably depend in a great degree on Marshal MacMahon. He may in his present position, and with the view he takes of his position, do France the greatest service which has been rendered her since Henri Quatre—a service which many great Frenchmen have dreamed of rendering her, but the opportunity for which a wayward fate has always denied. Of course, we assume that he is honest, and think we may do so with confidence. That service consists in the preservation of perfect order with a strong military hand, which all sects and parties know to be irresistible and not to be trifled with, while leaving discussion in the press moderately free, and protecting an Assembly, legal in its origin, in the full exercise of the right of legislation and debate. In other words, we believe the state of things which we are now witnessing in France, with all its absurdities and disappointments, may prove, if it can only be made to last a little longer, the most healthy and promising which the country has passed through since the States-General of 1562 at Orléans. It must be borne in mind, when we are disposed to grow impatient over the hesitation of the Assembly, that every one of the ten governments which have been set up in France since the first overthrow of the monarchy, has been the result of revolutionary violence, and has been contrived and proclaimed at two or three hours' notice, either by a military usurper or by a mob in the streets, and without the consent or approval of the nation at large. The consequence is that the very notion of a government as the product of deliberation, or of a balancing of reasons, or of any peaceful trial of strength between parties, in the forum of debate or at the polls, has faded from the popular mind. The people have come to expect that, as a matter of course, the sovereignty will pass from hand to hand by armed assaults or ambuscades; and therefore they look on all agitation, in one sense of the word, and on all speeches on political questions, as simply a prelude to civil war. When Gambetta goes down into the provinces at this hour, and delivers a harangue, the whole country listens with dread, and the Government gets its forces ready for the fray, and the Assembly prepares for coercive legislation. This state of feeling it is which accounts for the rise of a charlatan like Rochefort into the rank of a political personage. In a country in which great political changes were affected by persuasion, he would have remained all his life an obscure and rattlebrained Bohemian, with the reputation of a good café joker. But his literary powers made him capable, in Paris, of raising large mobs in the streets, and thus gave him a political future and opened to him a political career.

Now, MacMahon is at this moment giving France for the first time since the Revolution an opportunity of debating quietly the principles of government without fear as to the result. He is giving all the pent-up venom of parties the means of venting itself in the Assembly and the newspapers, in words which everybody knows will not lead to anything serious. The Legitimists have had their full say for the first time since 1830, and have tried all their arts and all their arguments, and have ended by being ridiculous. The Bonapartists, too, have the fullest opportunity of explaining their past misfortunes, and making promises for the future, and threatening their enemies. Lastly, the Republicans have the fairest field they have ever had for winning France over to their views. They have an able body of spokesmen in the Assembly, and a powerful representation in the press, and all the prestige which comes from the absence of a monarch. The country in the meantime is able to listen, to mark, and to learn, without trepidation or anxiety. It grows accustomed to the serious and peaceful strife of parties, and perceives that a regular government may be, and probably will be, now set up, after full deliberation and by a legal and orderly process. In the meantime, what the Marshal says to the Assembly is substantially this: "Gentlemen, the kind of government you give France is no affair of mine. Work it out for yourselves. You can dissolve to-morrow and order a new election, or sit on for seven years, or you can draw up a constitution and submit it to the popular vote, or adopt it yourselves without submitting it to the popular vote, and you may pass any laws or pursue any policy of peace or war you may see fit. None of this is my affair. My business is to see that for seven years to come there is no rioting, or revolting, or 'manifesting' in France; that the laws, such as they are, are faithfully executed; and that any decision which may be reached touching the constitution of the country, is reached by peaceful means. When you fixed seven years as the period during which I was to discharge these functions, you were doubtless of opinion that it would take that length of time for society to settle down, after the recent frightful calamities and changes, into peaceful channels. I entirely agree with you. I am your servant in the meantime, but your servant for a fixed term, and I mean to discharge the duties of the place honestly, and to give France, if possible, her first experience of the foundation of a government without crime or bloodshed."

THE TRIAL BY NEWSPAPER.

A CORRESPONDENT of the *Evening Post* complained bitterly the other day, in the interest of domestic decency, of the publication of the "statements" and counter-statements of the parties to the enquiry now pending in Brooklyn by the morning papers. But it is hard to see what the papers could do except what they have done. It appeared tolerably plain, from the moment Mr. Tilton published his first letter, that the whole affair would very soon be made the subject of an appeal to the public. The result was made certain by the mode in which Mr. Beecher applied for an investigation. A committee nominated by him, and composed of his own personal friends and members of his congregation, although it might satisfy the church over which he presides, was sure not to satisfy either his opponents or the public. It was inevitable that at some stage in the enquiry Tilton or his friends would, by hook or by crook, carry their case before the world outside, and this once done, the committee lost all judicial character, and became a mere instrument, and a very defective one, for taking evidence. No one will now care what its finding is, or whether it comes to any conclusion or not. The trial is transferred to a different forum. This forum consists of the newspapers and their readers, and a more unsatisfactory one, in some respects, there could hardly be, but it is the one before which a man in Mr. Beecher's position must plead, sooner or later, to any charge brought against him. From this neither civil nor ecclesiastical courts can save him. When the community exalts a man as it has exalted Mr. Beecher, it insists on deciding in the last resort whether its confidence has been misplaced. It may be said that this is one of the penalties of influence and celebrity, but it is also one of their conditions, and one that is familiar to everybody who wields the power given him by enormous popularity. It is in some respects an awful mode of trial, one by which the strongest nerves might well be shaken. The court has no rules of evidence. Before it nothing is frivolous or irrelevant or untrustworthy. It puts rumors, suggestions, theories, suspicions, reminiscences, hints, the idle gossip of the sidewalk, and the solemn asseverations of the eye-witness on about the same level. Everything goes to the jury in one dreadful jumble, and goes piecemeal, day by day, as it comes in, without arrangement or summing up. There is not a house in the country in which the defendant is not, week after week, put on his trial, and in every one of them on a different indictment and with different testimony; and the result he never wholly knows, as the verdict is never formulated and uttered. Moreover, it would be a great mistake to suppose that even the larger part of this tribunal is animated by anything that can be called a judicial spirit. It is impossible not to be struck by the tenderness with which Mr. Beecher's case has been approached, by the reluctance displayed on almost all sides to believe ill of him, by the eager hopefulness with which his defence has been listened to, and by the height and breadth of the favorable presumptions by which he has been surrounded. It is true that much of these presumptions rests on forty years of unblemished character, but much, too, is supplied by popular indulgence for a man whom the country has greatly trusted and greatly loved. On the other hand, however, a vast amount of the interest taken in

the case springs from motives with which neither love of him nor love of justice has anything to do. Thousands on thousands gloat over the story simply because it is scandalous; thousands more because the standard set up by such a man as Beecher seems a constant condemnation of their own ways and aims. The overthrow of a great moralist is always a triumph for those who deny that there is any morality but what each man manufactures for himself. It acts both as a justification and encouragement to them. "A bad year for the righteous," as Butler said, is a good year for those who make no pretence to righteousness. It raises them in their own estimation, puts an end to some prickings of conscience, and opens up new fields of activity. There is no rascal in the country to-day who is not openly or secretly hoping that Beecher may not succeed in extricating himself from the net in which he is now entangled. And then there are thousands of men who are really not rascals, and pass as very respectable, to whom the downfall of anything great or respectable in human society is somehow a satisfaction, though they do not well know why, and are often ashamed even to confess it to themselves. The source of this feeling is one of those mysteries of human nature on which neither the naturalists nor the theologians have thrown much light, and it is one which nobody who wishes to think well of his kind likes to explore. To say that it is a form of envy is simply to name without explaining it. Of its wide diffusion, of its powerful influence in our social life, one knows comparatively little until one witnesses the progress of a scandal such as that which is to-day the talk of the country. It is intensified towards religious people by the necessary ostentation of their professions, and by their tendency to treat as mere temporary lapses from virtue, which can be atoned for and reformed by the technical process of repentance, things which men of the world, sometimes rightly and sometimes wrongly, set down as irremediable defects of character.

There is, however, a far worse source of interest in the "Tilton-Beecher Scandal" than any we have enumerated, and one which much more clearly reveals the barbarian strain in our blood. Trial by newspaper has certain spectacular attractions to which no other process can lay claim. In proceedings, however tragic, before courts of law, the parties are represented by professional advocates, who, even if they lay aside the conventional decorum of their callings and attempt a display of pathos, can hardly rouse the feelings of the audience. The retainer takes the point from their weapons, and gives a greenroom air to their tears and supplications. The real play of passion nowhere appears. The plaintiff and defendant are silent spectators of the game of skill and ingenuity on which their fame or fortune is staked. When they appeal to the public, however, especially in what may be called capital cases, the controversy has all the horrible interest of a conflict in the arena. Surely, no scene in the amphitheatre was ever more shocking than the assault on each other in which Tilton and his wife have been engaged in the newspapers during the past week. His production of her letters, written in moments of happy and confiding if somewhat effusive tenderness, to justify his desperate attack on her reputation, and her bitter and incoherent imputation to him of all base and malignant passions, of meanness, falsehood, treachery, of envy, hatred, and malice—and all this under the eyes of millions of spectators, to whom the mutual rage and destruction of this unhappy couple gave but a keener relish for their breakfasts—what is there so horrible as this in the *spectacula* or the bull-fights? Is it not somewhat disgraceful to our civilization that such quarrels should have to be fought out in this way, that we should have to protect domestic happiness and purity by inviting the whole world to see the Furies tearing a household to pieces?

The trial of certain classes of cases by the newspapers, if inevitable, however, furnishes no excuse for spreading a "scandal" over a wider area and forcing it more persistently on the public attention than the circumstances absolutely require, and we think there are numerous signs that we are to be treated to more of this Brooklyn affair than is good for either our morals or our manners. We are sure that the bulk of intelligent and decent people greatly deplore the necessity of surrendering to it as much space and attention in the newspapers as it has already received. It is a most unsavory subject, and the more it is discussed and turned over, the less profitable all discussion of it seems to be. We now beg to remind the editors of the daily papers that their sole justification for serving us up every day such a quantity of unwholesome gossip and speculation lies in the fact that the person whose reputation is assailed in it is a man of great prominence and respectability. It is only in so far as it concerns Mr. Beecher that this wretched business has any legitimate claim on the public attention. We protest, therefore, most earnestly against the execution of the plan which seems to be entertained in some quarters of favoring us with what they call "further exposures," in the shape of additional information about Mr. Tilton's family life and his relations with his wife and with other women. With these things the public has nothing to do, and we trust the press will not connive at any further investigation o them. It can serve no purpose beyond deepening the flood of indecency which is already flowing over the country. The public is not sufficiently interested in Mr. Tilton, and he does not occupy, and never has occupied, a sufficiently prominent place in the community, to entitle him to this species of notoriety. His domestic history is not a public concern. It is plain that it has been unhappy to the last degree, and that is all we wish or need to know about it. We must remind Mr. Beecher's friends, too, in all kindness, of the fact which they seem disposed to forget, that attacks on Mr. Tilton's reputation cannot possibly help Mr. Beecher's case as it now stands. It might be useful to prove him a bad husband and father if the proceedings now pending were an action for damages or a suit for a divorce in a court of law. But they are neither the one nor the other. The only result of proving Mr. Tilton's baseness, under present circumstances, would be either to deprive him of public sympathy or to invalidate his testimony. But the question before the public is not whether Mr. Tilton is entitled to sympathy; it is whether Mr. Beecher has been guilty of certain offences; and the case against him does not rest on Mr. Tilton's testimony simply. If it did, it would have been closed long ago. It rests on certain letters purporting to be written by Mr. Beecher himself, of which he does not deny the genuineness. All that the community now wishes to ascertain is how he explains these letters. It cares nothing and wants to know nothing about Tilton's morals or religious opinions, or about his relations with "advanced thinkers" of the female sex.

The case was brought on the very first day within a very narrow compass—much narrower than Mr. Beecher himself seemed to perceive when he wrote his statement. Had he thoroughly comprehended the situation, he would have saved himself the trouble of traversing Tilton's naked assertions, and have addressed himself at once to the task of explaining the circumstances under which he wrote the letters embodied in Tilton's complaint. We trust he will now do this, and that in the meantime his friends and champions will keep silent with regard to everything which does not touch this point, and we think their duty in this respect includes a decent reserve in the matter of denouncing Tilton. If Mr. Beecher's explanation is found sufficient, as we must all hope it will be, the whole matter can properly be dropped as an evil dream.

Correspondence.

SOME EFFECTS OF OUR CURRENCY.

To the Editor of the Nation:

Sir: In your remarks upon American travel in Europe, you have not touched upon one consideration which, as it will help to explain several other phenomena, ought not to be overlooked.

Ever since the war closed, the great effort of the Treasury and the people has been to depress the price of gold. Not only has the former sold all its receipts from customs, but it has actually diminished its resources, holding a surplus above liabilities of only ten millions (against thirty-five millions in 1869), with a total of seventy-four millions (against one hundred and ten millions at the earlier date). Add to this the enormous force of the Gold Clearing-House, through which transactions of a hundred millions in a single day are often settled with three or four millions of actual gold, thus multiplying the apparent supply to the full extent of the larger amount. This artificial depression would long since have been corrected by foreign export, had it not met a counter-current in the apparently inexhaustible demand for our securities—good, bad, or indifferent—abroad.

Now let us suppose that while these combined forces have kept gold at 110 to 120, the real depreciation of our currency, as measured by general prices, is 150; in other words, that the price of gold, as frequently happens with coffee, wool, sugar, or any other article, is below the average level. Is it not evident that much more may be had for the same money by turning it into gold and spending it in Europe, than by spending it in currency here? And with a difference like this, amounting to one-fifth, extended over several years, is it not inevitable that the movement should assume vast proportions? It is, of course, a matter of guesswork, but, after talking with many persons, I am inclined to place the average of Americans in Europe at not less than 50,000, and allowing them an amount of $2,000 apiece, which is certainly not excessive, we should have one hundred millions as the yearly drain upon us from this cause.

That this idea may not appear wholly fanciful, let us take another item. The complaints of the Western farmers have arisen within a few years. Doubtless over-production has much to do with them, but it is not the only cause. It has been too often remarked to need explanation, that the price

of the whole grain crop is determined by the exported portion. Of course the gold price is regulated by the foreign markets, but the farmer has nothing to do with gold. He gets his pay in currency, and his expenses of labor, supplies, and transportation are also in currency. Now if the gold price of his crop brings but 120 or less, while his expenses are on a scale of 150, it is manifest that the farmer will earn nothing, even though the railroads are doing business at a loss.

Once more, Hon. David A. Wells, in one of his revenue reports, declares with a sort of despairing wonder: "It thus appears that notwithstanding an average tariff of 40 per cent., there is hardly an article which the United States cannot import cheaper than they can produce." This apparent paradox becomes the simplest of all propositions if we suppose that the importer gets 150 for his goods, and buys his gold for remittance at 110 to 120.

Looking at the subject from another point of view, we find it admitted that, since the war closed, the United States have run up a debt in Europe to an amount of 1,500 millions. But except during the panic last fall we have not only imported no gold, but we have shipped from thirty to sixty millions a year. And that this is not wholly the surplus produce of our mines is shown by the steady diminution of the only visible and it is to be feared the only real stock of gold in the country, that in the Treasury.

While the President was imbibing the views of Senator Jones of Nevada, it is a pity he did not include that portion which involves an accumulation of gold and a stoppage of sales by the Treasury. The Bank of France, with five hundred millions of notes, holds two hundred and fifty millions of gold, and yet they hesitate to resume, and keep their rate of interest higher than any other large market in Europe. We have seven hundred and thirty millions of notes afloat, besides six hundred millions of bank-deposit currency, while the Treasury holds but seventy-five millions of gold.

Of course the price of gold would advance, but, as Senator Jones says, that would not be an unmixed evil. In the first place, Americans, instead of making the name a by-word in Europe, would come home and spend their incomes here. Next, the agricultural interest would at once revive, and put an end to the dangerous conflict between the farmers and the railroads. Thirdly, our manufactures, which, while they have to bear the odium of an excessive tariff, get no benefit from it, and are languishing under foreign competition, would also revive. Last, but by no means least, it would furnish the only effective answer to the inflationists. The strongest argument of Senator Morton and his coadjutors in favor of more currency rests on the decline of gold last fall to 106½. With gold at 140, the country would wake up to the true state of the case, and Congress would be compelled to deal with the real difficulty, the condition of the currency, the evil effects of which are now artificially concealed. G. B.

Boston, July 20, 1874.

THE COLLEGE RACES.

To the Editor of the Nation:

Sir: The following paragraph appeared in the *Tribune's* account of the assemblage at the depot on Monday to welcome the Columbia crew:

"Noticeable among those gathered was the venerable form of President Barnard, who wore a huge blue and white rosette with ribbons attached, and the pride which glistened in his eyes and expressed itself even through his spectacles bedewed with moisture, told how deeply he felt the victory which had been won by the Columbia crew. Among others present were Prof. George Naire and lady, Dr. Anderson, the Rev. Drs. Buell and Cornwall. Among them was Prof. Van Amringe, commodore of the boat-club, who stepped on the rear platform of one of the cars and made a speech to the assembled throng, telling them that the crew found themselves unable to come down from Saratoga, but that they would be in the city with their boats to-day. During the delivery of his remarks he was repeatedly cheered, and at their conclusion he was lifted upon the shoulders of friends and carried out of the depot."

Tuesday afternoon, President Barnard, in addressing the crew from the portico of the college, said that he had favored boating from the start, that the crew had done more to spread the reputation of the college than anybody else had done since its foundation, and that if anything was wanted from the board of trustees to further boating interests the students need only ask for it.

These passages have been quoted as illustrative of the relations between the authorities and the students.

Now for some more facts.

The relations between faculty and students are less intimate at Harvard than at Columbia, and still less at Yale than at either.

Neither Harvard nor Yale won the race.

Harvard's behavior at the race is reported to have been discreditable. Yale's is reported to have been more so.

All these facts taken together suggest the following conundrums:

I. Would the chances of the two large universities have been better if their boating interests had been encouraged by their trustees, and if they had had the sympathy and practical co-operation of members of their faculties?

II. Is not the advertising which victory in a boat-race gives a college worth the attention of its authorities?

III. If there were at Yale and elsewhere that intimacy between the faculty and students whose absence has lately been so bitterly complained of by "Young Yale," is it likely that the influence of the older men would infuse into the students a spirit of justice and dignity that would make impossible such disgraceful occurrences as those which have just accompanied the defeat of Yale and Harvard?—Your obedient servant,

A Graduate of Yale and Columbia.

New York, July 21, 1874.

[Some of our correspondent's "conundrums" open questions so wide that we do not know how to answer them. Upon one point, however, we wish to say something, because a great deal of confusion has been thrown around it; some injustice has thereby been done not only to the crews of eight colleges present at the finish raft on the day of the race, but also to the public; and a certain well-earned award of praise has been with less than fairness withheld from one particular crew. This crew to which we refer as having in one respect earned more praise than it has yet received is the Harvard, of whose conduct equally with that of Yale our correspondent speaks as "disgraceful." What may have been the conduct of the two on the water when the foul took place, we cannot at all say. Few but those immediately concerned saw it, and of those perhaps not one saw it well. The referee himself has not been able to give an opinion which he can make boating men accept as wholly right, or even to the extent of making them regard Yale as more blameworthy than Harvard, which he asserts in so many words. The *Spirit of the Times* of July 25 may be referred to for an examination of his rulings, more learned than we can pretend to offer and bearing marks of care and impartiality. But as we say, with this we have nothing to do. If the referee's judgment is set down as faulty by those best placed to see and best fitted to pass upon it, we may readily decide how to deal with the heaps of evidence furnished by men like a *Herald* correspondent, who reported in his journal on the 20th that "it was thought in Saratoga that Yale would never row Harvard again, as it was believed there that Harvard had sold out to New York city." It is enough to say that little can now be known about the trouble on the water, as it is excessively unlikely that the crews themselves will ever be submitted to the cross-examination of experts.

But at the raft at Moon's there was no doubt about the disgracefulness of the behavior of one of the crews, or at least of one of its members. Speaking roughly, one crew, or part of it, applied to the other an epithet of the grossest and most offensive kind, and challenged them to go ashore and fight, and these sat by in silence and self-control, and let the others talk. All this is matter of general admission; and what it says for the two crews is, in plain language, that the members of the one behaved in a disgraceful manner, and the others behaved as they should, and, considering their provocation, deserved commendation and should have it. "Equally to blame" is not in this case a verdict that ought to satisfy anybody. Not to dwell too much on this hot and blackguard language, we may say that we think it ought to be construed against the Yale captain that, as he himself reports, he turned to the rival boat when he drew up even with it and went beyond it, and said to the stroke, "Dana, you can't win this race; you haven't got the stuff." This is the language of a ruffianly waterman, not of a gentleman amateur, and is prophetic of what happened afterwards at Moon's.—Ed. Nation.]

Notes.

THE late Rev. Francis Mason, D.D., who died at Rangoon in March of the present year, was for forty-four years one of the foreign missionaries of the American Baptist Union. In 1869, he prepared a sketch of his career, which had been remarkable in many ways, but saw fit in publishing it to

give it the ambiguous title, 'Story of a Workingman's Life.' Of this interesting and instructive work a new edition is now announced by Mr. Albert Mason, who states that it will be brought down to the date of his father's death by Prof. W. C. Wilkinson, and, in addition to the woodcuts of the original edition, will be embellished by a steel portrait of the learned and lamented author. The title will properly be changed to 'Autobiography, etc.'——Part 20 of Stieler's 'Hand-Atlas' (New York: L. W. Schmidt) contains a general map of the United States and of Mexico, and two maps of Upper and Lower Italy, with several supplementary maps of particular localities on an enlarged scale.——Our recent reference to an error in the English translation of Mommsen's 'History of Rome,' by which the sense of a passage in Cæsar was perverted, leads a correspondent to point out one in Merivale's 'History of the Romans' (Vol. I., p. 256). This author states one of the requirements which Cæsar (B. G. i. 35) urged upon Ariovistus to have been "to restore their hostages to the Aedui and Sequani," whereas the demand was that the German chieftain should return to the Aedui such of their hostages as were in his keeping, and permit the Sequani (nominally his allies but really his subjects) to do the same. The error is a very obvious as well as a very important one, and may have been pointed out before.——A bird's-eye view of the Mill River Valley, and a map of the stream from Williamsburg to its junction with the Connecticut, are to be found in the last edition of Burt's 'Guide to the White Mountains and the River Saguenay' (Springfield, Mass.)——The *Historical and Genealogical Register* (Boston) for July publishes a list of some of the officers in the American army near Boston in June, 1775. It was first printed about fifty years ago in a New York paper, and purported to be part of a letter from Judge William Browne (afterwards Governor of the Bermudas) to a fellow-loyalist who had preceded him to England. The same number contains, with a great variety of interesting matter, a biographical sketch and an excellent steel portrait of the late William Whiting.——Mr. John Russell Bartlett contributes to the Providence *Journal* of July 22 a readable account of the contents of the valuable library of the late John Carter Brown, which is superlatively rich, as all scholars know, in works relating to the early history of America published before the year 1800, as well as in many other lines. Mr. Bartlett made a catalogue of this library, which was printed in 1865–71, but the edition consisted of only fifty copies. He states that the collection of *Americana* remains in the possession of Mr. Brown's family, and is to be carried forward in accordance with the liberal policy of its late owner.——The rules governing the Centennial Exhibition may now be obtained by those interested of the Director-General, Mr. A. T. Goshorn, at Philadelphia.

—We have, in common with several other journals, received a printed communication from Miss Harriet Hosmer, dated at Rome, June 29. It is much too long for the space at our command. Miss Hosmer, who was, with several other American artists, made the object of Mr. S. W. Healy's imputations of professional dishonesty and want of originality, replies by opposing to him the testimony of the only witness cited in her case. The rest of her letter is devoted to informing the public of the mode by which statues are evolved from the clay and the marble, and of the universal practice of employing assistants for the purely mechanical part; to an exposition of the division of American artists in Rome into two cliques, who hold no intercourse with each other, and to one of which Mr. Healy is alleged to belong, so that it was foreordained whom he should select for his attacks; and to expressing regret that an American could be engaged in smirching the reputation of his own countrymen abroad.

—The advance sheets with which we have been favored have already given us occasion to describe the general character of the 'Statistical Atlas of the United States' which, by special authorization of Congress, has been prepared by Gen. Francis A. Walker, late Superintendent of the Ninth Census. We are now glad to chronicle the appearance of Part III.—Vital Statistics, and the promise of the speedy appearance of Parts II. and I. The letterpress, not included in the original appropriation, and only provided for in June, will be somewhat delayed, but may be looked for in September at furthest. "Part I.," says the compiler's announcement, "will consist of maps illustrative of the physical features of the United States, embracing its river systems and forest growths, its geology, hypsometry, and meteorology. This part is almost wholly made up of contributions from eminent men of science, and from some of the scientific services of the U. S. Government. Part II. will consist of maps and charts illustrative of the growth of population from 1790 to 1870, of the constituent elements of the present population, and of the social and miscellaneous statistics of the census, embracing the subjects of wealth, debt and taxation, illiteracy, church accommodation, the occupations of the people, principal crops, etc." Part III. embraces the maps and charts numbered 37–54. Of the former there are six, all colored on the same base-map—the United States east of the 100th meridian. They show the predominating sex; the birth-rate; and four classes of deaths, viz., from consumption, malarial diseases, intestinal disorders, and enteric, cerebro-spinal, and typhus fevers. In each case, five tints of intensity are used, and the whole story is revealed at a glance—we mean the main story; the maps afford ample room for study. The artistic execution of them merits hearty praise in passing; it fully maintains the high standard of work to which the establishment of Mr. Julius Bien has accustomed us. Less perspicuous at first, and less attractive, are the twelve charts of statigraphic delineation, of which Mr. Wines, the inventor, has given some account in our columns. These, too, however, have an almost unlimited capacity for being profitably studied. Two plates are devoted to each of the topics—blindness, deaf-mutism, insanity, and idiocy; and in all the eight there is a comparison of the census returns of 1870 and 1860. There remain charts of the population of the United States—aggregate and by States—showing the proportion of the sexes at various ages (by decades) and the preponderance; the native and foreign population—both sexes—by States and Territories; deaths (by decades) for the whole country and again by States, and according to certain groups of diseases and special diseases—both sexes; and finally, the same statistics for each month in the year. The last two are of extreme interest. For instance, it is plain from these representations that June, if not the healthiest month in the year for all the States, still almost without exception forms a mean term between the mortality of the first and the last half of the year; the mortality may be less in some one of the succeeding months, but it is also sure to be greater. It also appears that, notably for pneumonia and consumption, diseases of the respiratory system prove more fatal in the first than in the last half of the year. But we have no space for further examples. We congratulate the country on the success of General Walker's work, the value of which will grow with time, and we hope that the Secretary of the Interior, on whom the distribution of the work devolves by act of Congress, will see that the Atlas is judiciously placed, subject to the limitations of the edition, in all the principal libraries and the chief institutions of learning in the land.

—The *American Naturalist* for July proposes the organization of a new department of Government, the Science Department, with appropriate bureaus. These, so far as they already exist, would mostly be taken from the heterogeneous Interior Department, but the Navy would part with its Observatory, the Treasury with the Coast Survey, the War Department with the Signal Service; and under this head would be grouped the bureaus of Agriculture and of Education, the Smithsonian Institution, etc., etc. It is clear that a very respectable portfolio could be created out of these elements alone, and, well administered, might be conducive to greater economy and efficiency in the several branches, besides leading to more frequent co-operation between the National Government and the States, as (to cite the latest instance) in the standing offer of assistance from the Coast Survey to any State desirous of undertaking its own survey. Nor do we suppose it would be impossible to find a chief executive officer with the requisite capacity for directing in the best manner the scientific energies of the Department. It is questionable, however, whether, in the low state of our civil service, the military and naval scientific bureaus would not feel themselves degraded by the transfer, and whether after all they would make up in other ways for the loss of the discipline to which they are now more or less subject. Perhaps, too, it is doubtful if Congress would be as liberal to the Department as it now is to the scattered bureaus, the items of scientific expenditure being concealed in the appropriations for the general expenses of each department. While it must be conceded that our Government need fear comparison with no other in its outlays in behalf of science, it is equally true, if not equally notorious, that the coveted appropriations for special work, like the national surveys, are usually obtained by quiet and almost secret legislation; and that science cannot come before Congress as frankly with its petitions as commerce and manufactures do. Nevertheless, we think Congress would not greatly object to the new Department, provided the scheme did not contemplate the creation of many new offices, and provided there was no opposition to it from the bureaus and departments to be affected by the change.

—A miscellaneous list of topics, each worth a word of comment, doubtless suggested itself to many observers of the regatta at Saratoga. One of the lesser matters was that of colors. Few of the colleges can be said to have made a very good choice if we think of the object for which after all the choice was for the most part made—the object, namely, of distinguishing a given crew by its head-handkerchiefs. Harvard's magenta is distinguishable both by daylight and in such a semi-twilight as that in which the race was finished at Springfield last year. But a good light is required to distin-

guish at a little distance the deep blue of Yale from the royal purple of Williams, or either of them from the black heads of bareheaded oarsmen. Princeton selected for her first appearance an admirable color, the orange, to which the birth and title of Nassau Hall give it a show of right. But although this very suitable and eye-taking color made itself most conspicuous in the little bannerol which showed what part of the collegians' grand stand was devoted to the use of the Princeton undergraduates, the men in the boat rejected it for white and their friends ashore for some variety of yellow, which was of a London-fog color or next to invisible. Wesleyan can hardly be said to have a color, and in a race where any crew or part of a crew wears white caps, the Wesleyan lavender may well be confounded with the white. Dartmouth's grass-green is excellent in the sun; but in the fading of the light becomes black like Williams's purple and Yale's blue.—A marked feature of the race last year was the fulness of information given by the Springfield papers. The press of that city is one of so great enterprise and skill that to ask the press of a country town like Saratoga to compete with it in most respects would be foolish; but certainly the Saratoga press might have done more than it did in the way of collecting and collating full information about the crews and their prospects and doings, and would thus have put many people under obligations. We do not think that it contained so much as a directory from which one could learn the whereabouts of personages so important as Mr. Commodore Brady and Mr. John P. Conkling.—There was pressing need of a central office of information of all kinds pertaining to the regatta, and the establishment of such an office would probably lead to the establishment of a centre of authority, consisting if possible of one man whose word should be final on as many subjects as his administrative talent will permit him to take charge of. Such an authority could be held responsible for the signal-men, for instance, and might not place at the finish an incompetent who lost his head as the boats went over the line, and dropped his flag in token that one had crossed when four had already been home many seconds. So, too, he could be held responsible for the time-keepers and starters, and probably would not select men who for some reason or another would see fit to resign at the very last moment. Probably he might be depended on to do what forty men together never could be depended on for, and would contrive some way of signalling to a crowd of twenty thousand persons that they need not wait two hours longer for the race, as it would not come off that afternoon. Such an authority, advised by agents of the colleges, but unhampered by committees of collegians armed with powers which they cannot very discreetly use, might make a regatta a far pleasanter affair than it usually is. He would have to be a man of sense, and of some knowledge of boating, and he would have to be paid for his services; but he would do the work which citizen committees and collegian committees have never done well, nor so much as half-done since regattas became affairs of so large a size.—Impropriety of conduct on the part of undergraduates at Saratoga there was almost none so far as we have seen or heard, nor was there any on the part of other visitors. Everything was quiet and orderly, except the natural jubilations of the victors and their friends and some small trifle of hustling, hardly worth mention, which took place on one occasion when friends of two of the rival crews met in a hotel corridor or office-hall. In old times, when but two crews contended, the victorious one, or rather its friends, made it a point to turn things upside down, partly out of joy, partly to show that the means of riot had not been cut off by the prohibitory ordinances of the town magistracy. But now too many colleges are represented, and too many men of more or less uncongenial sympathies look on, and public opinion thus reinforced is too strong for the *amour-propre* of any one college. This was the case in Springfield last year and again in Saratoga this year, and the improvement is a welcome one.—The complaints about carriages and carriage-hire are probably well founded. Saratoga is not a town large enough to furnish at short notice, or at long notice, vehicular accommodation for several thousands of newcomers, who wish to be carried through the dust four miles out and back within five or six hours. Too few trips could be made, and there were not carriages and wagons enough had there been an opportunity to make more.—As for the course, everybody's second thought seems to set it down as a very good one, all things considered, needing, however, for its improvement a power vested in the referee to order the race to take place on the given day any time after nine o'clock in the morning. But we may expect to hear New London spoken of; and Springfield still has its friends.

—The Massachusetts of tradition and history is to a great extent the geographical Massachusetts which lies to the east of Worcester, though there are wanting to Western Massachusetts and the Connecticut Valley neither the men nor the events which make history. As has long been known, a change is coming over the Massachusetts of the Boston and Charlestown and Plymouth and Salem end of the State, and Governor Winthrop, could he rise from the dead, would be disturbed, but on information and reflection would not be surprised, at the aspect of General Butler's constituency. The foreigner possesses the land; and Winthrop's contemporary, Milton, would have spoken with still greater contempt of the current Boston Directory than of the Scottish surnames which the booksellers had made known to his London public:

> "Colkitto or MacDonnel or Galasp,
> Those rugged names,
> That would have made Quintilian stare and gasp."

The Boston *Pilot* says that the Directory bristles with Celtic names, and that it must be startling to the Puritan to cast his eye along the sturdy columns of the O'Shaughnessys, O'Neills, and McNamaras. The *Pilot* thinks that at least one-half of the names in the volume are purely Celtic, counting for Celtic the Scotch names of course as well as the Irish. It appears that of all the Os and Macs, the O'Sullivans or Sullivans have the best of it, there being in all 914 of them enumerated, of whom 34 retain the O, the others having dropped it, if, as we suppose, they all had a right to bear it. The *Pilot* credits the Sullivans with old-fashioned families, and thinks that all the Sullivans, big and little, male and female, marching across the city on a picnic to Plymouth Rock, would make a pretty sight. "Shades of Cotton Mather," it says, "only think of it!" Close after the Sullivans comes the sept of the Murphys. These number 820, and it will be seen that were the latter, on their way to a picnic at Bunker Hill, to chance to meet the former on their way to Plymouth, there is no telling which would leave most wigs on the green. The O'Briens are 452; the McDonalds and McDonnells, 432; the McLoughlins, 304; the O'Neils, 233; the Fitzgeralds, 240; the Hogans, 100; the Coughlins, 104; the Welchs, 370; the Flynns, 225; and there are smaller companies of the McGonagles McGuires, O'Connells, O'Keeffes, O'Connors, O'Donnells, Sheehans, Flahertys, Foleys, Connollys, and many more.

—Dr. Hammond delivered an address on assuming the presidency of the Neurological Society, on the effects of alcohol on the nervous system, which is reported in the July number of the *Psychological and Medico-Legal Journal*. In the debate on the address which followed, Dr. Lente, Dr. Willard Parker, Dr. J. C. Peters, and Dr. Aymer, all well-known physicians, took part, but none of them dissented from his principal conclusions. These conclusions are drawn in the main from actual experiments made either on himself or on animals, some of which he exhibited to the audience. He believes that alcohol, though it has no constructive force, has conservative force; that if, for instance, a man is working with such degree of intensity that all the food he is able to procure or (which is the same thing) to digest does not prevent his weight diminishing—say one ounce a day—a moderate dose of alcohol will enable him to perform the same amount of work on the same quantity of food without loss of weight. From which it follows, as Dr. Hammond also proved by experiment, that a person in good health, whose food supplies all the waste caused by his labor, does not need alcohol, and his taking it will probably cause disturbances to the general health similar to those caused by overeating. This doctrine, of course, makes alcohol useful to persons whose digestion is too feeble to supply the amount of necessary repair to the tissues. He further finds that alcohol affects the system mainly through the nerves, and only secondarily, if at all, through the blood—a point which he proves by numerous interesting experiments. Any amount of alcohol which does not prevent waste, and thus take the place of food to a certain extent, may be pronounced excessive, but what is excess in any individual case he declares that no one can tell *à priori*—a single glass of wine may be excess for some "individuals, while to others it fills a rôle that nothing else can fill." He adds:

"With reference to the moderate use of alcoholic liquors, it must be remembered that we are not living in a state of nature. We are all more or less overworked; we all have anxieties and sorrows and misfortunes, which gradually in some cases, suddenly in others, wear away our minds and our bodies. We have honors to achieve, learning to acquire, and, perhaps, wealth to obtain. Honors and learning and wealth are rarely got honestly without hard work, and hard work exhausts all the tissues of the body, especially those of the nervous system. Now, when a man finds that the wear and tear of his mind and body are lessened by a glass or two of wine at his dinner, why should he not take them? The answer may be, because he sets a bad example to his neighbor. But he does not. His example is a good one, for he uses in moderation and decorum one of those things which experience has taught him are beneficial to him. And why should he shorten his life for the purpose of affording an example to a man who probably would not heed it, and who, if he did, is of less value than himself to society? . . . But if we cannot overcome the instinct [the love of stimulants and sedatives] by prohibitory laws, we can regulate it and keep its exercise within due bounds. My own opinion is, that the best way to do this is by discriminative legislation in favor of wines and malt beverages, and against spirituous liquors. I would make it difficult to get whiskey. I would provide that what was sold should be pure, and at the same time I would make it easy to procure light wines and beer. And I would likewise offer every encouragement to the growth of the vine and the hop. Experience has shown that total prohibition, while failing to a great extent in practice, drives

men and women to opium and Indian hemp, substances still more destructive to mind and body than alcohol."

—The erection at Bedford, England, of a statue to John Bunyan, has been the occasion of a good deal of essay-writing—some of it perfunctory and some of it not, but most of it at least decorously respectful to the genius of the author and to the fame and usefulness of his great work. Not all the comments were so, however; and much to be regretted as some of them are for their pettiness and malice, it is proper to give a look at them if only to congratulate ourselves with all proper humility that either our surrounding worldly circumstances here in America, which give everybody plenty of elbow-room, or the stronger operations of the grace of charity among our churchmen and laymen alike, have in good part purged away a sort of venomousness which is too perceptible in certain organs of the church by law established in England. The *Standard*, hearing of the statue, spoke of the 'Pilgrim's Progress' as a volume which stands next to the Bible on many book-shelves; but they are "the scantily-furnished shelves of Dissenters of the lower order." To the same journal's historic vision, the Puritans of Bunyan's time were "savage enemies of the church, traitorous assailants of the crown, merciless persecutors, and unscrupulous murderers." So was King David an adulterous tyrant, and Marcus Aurelius, as the Sunday-school historians deduce for us, a man of a cruel and bloodthirsty disposition. The *Church Herald*—says the *Examiner and Chronicle*, to which we are indebted for our facts—thought Bunyan "a sectarian of some natural ability," belonging to a class "who managed to disobey most effectually one of the plainest and most explicit commands of the Gospel, and refused to suffer little children to come unto Christ." In other words, the man who dreamed a dream and invented the City of Destruction and the Delectable Mountains, the Land of Beulah and the Slough of Despond, Giant Despair and Diffidence his wife, Mr. Great-heart and Vanity Fair, was not a Pedobaptist; and as his allegory has now been before the world two hundred years, it is a good time to consider its author in his capacity as a person holding views on the subject of the baptism of infant children. The *Examiner and Chronicle* is a warm Baptist journal, and we give, without venturing comment, its statement that the *Church Herald* goes on to say that since a statue has been erected to Bunyan, another in blackened bronze should now be set up to the devil, and Dean Stanley should be asked to pronounce the eulogium. False liberalism is a nauseating thing surely; but as for conservatism of the type illustrated in the quotations above-given, what can be said of it? Its ineptitude, its failure to see the real point, and its bitterness and injustice naturally flowing from this intellectual failure, remind one as much of anything as of Solomon's question: "What is heavier than lead, and what is the name of it but a fool?" The scornfulness and insolence are, however, the qualities which will be most readily perceived, do the most mischief, and make most enemies to the cause in church and state which these and similar journals partly represent. No man of an ordinary sense of justice but resents such speeches, about whomsoever made.

—The Comte de Paris, who has already won a distinction in the literary field which is rare among members of royal houses, has just published in Paris a 'History of the Civil War in America,' in two volumes. The *Revue des Deux Mondes* for July 1 contains the opening chapter, in which the author describes the conditions, both social, political, and military, in which the outbreak of the conflict found the country both North and South, and discusses the real and ostensible causes of secession. Nothing fairer or more comprehensive or perspicacious has appeared within the same compass on these points, and his sympathies are plainly and undisguisedly, aristocrat though he is, with the "plain people" throughout, and with their social and political ideals. In exposing the falsity of the pretext put forward for English use at the outset, that the tariff was at the bottom of Southern discontent, he falls into one error which, though slight as regards the war itself, has some importance as regards the fiscal history of the country and our present financial situation. He says that "the reproaches addressed to the Northern States by the Southern planters apropos of the protective tariff, which favored the manufactures of the latter, were [more] specious; in reality, they had no better foundation, for the Morrill tariff, the highest there has ever been in the United States, was passed under Mr. Buchanan, at the time when the President and Congress were both devoted to the interests of the South. If they [the Southerners] allowed that to pass when they could have hindered it, it was because they did not consider it injurious to their interests." Now the fact is that the Morrill tariff was not passed until March 2, 1861. At that time six Southern States had already joined the Confederacy, and were represented at the first Confederate Congress, which met February 4, in Montgomery. Moreover, the members from most of the other Southern States had ceased to attend or to take any interest in the deliberations of Congress in Washington. Indeed, the rapidity with which a rigidly protectionist policy was adopted the instant the Southerners withdrew, did influence public opinion in England strongly in favor of the Southern theory of the tariff origin of secession.

MR. FROUDE ON THE PROTESTANT ASCENDANCY.*

II.

IN 1792, Charles Sheridan thus defined Protestant ascendancy:

"By Protestant ascendancy he meant a Protestant king, to whom only, being Protestant, they owed allegiance; a Protestant House of Peers, composed of Protestant lords spiritual in Protestant succession, of Protestant lords temporal with Protestant inheritance; and a Protestant House of Commons, elected by Protestant constituents; a Protestant legislature, a Protestant judiciary, a Protestant executive, in all and each of their varieties, degrees, and gradations."

This definition was accepted by the majority of the Irish House of Commons as describing the system of government which they were prepared to uphold.

In 1780, Grattan spoke as follows:

"Are we to be a Protestant settlement or an Irish nation? . . . . The penal code is the shell in which the Protestant power has been hatched. It has become a bird. It must burst the shell or perish in it. Indulgence to Catholics cannot injure the Protestant religion. That religion is the religion of the state, and will become the religion of Catholics if severity does not prevent them."

Is it the intolerance of Charles Sheridan or the policy of Grattan which has the fairest claim to the title of statesmanship? This is the question which an historian of Ireland is compelled to answer. On his reply depends his whole view of the course of modern Irish and English history. Mr. Froude answers in effect, if not in so many words, that the policy of Grattan was the expression of fundamentally erroneous principles, and that the intolerance and bigotry of the Orangemen have been proved by events wiser than the wisdom of Burke, the statesmanship of Pitt, or the patriotism of Grattan. His criticism on Grattan's speech is enough to bear out the general description of Mr. Froude's sentiments, which we should have thought might be collected from every page of his work, were it not that an able critic has asserted, with astonishing hardihood, that Mr. Froude has nowhere "implied that Catholic emancipation was a bad thing in itself."

"Piece by piece," writes Mr. Froude, "the shell has been broken off. Has the Protestant bird developed power of wing in consequence? Do the Catholics seem any more to admire it? Let us look for answer in the Disestablished Church, in the obliteration of the Protestants in Ireland as a political power in the country, in the reduction of the Viceroy into a registrar of the decrees of the Vatican, and the boast of a cardinal that Irish nationality is the Catholic religion."

It is fair to test Mr. Froude's capacity as a political theorist by his views with regard to the penal laws and the policy of toleration. They give the color to the whole of his last two volumes. Though opposed to the received Liberal creed, they express the views of a large and increasing minority, who think that toleration as applied to Catholics is grounded on false principles and has ended in failure. Whether the history of Ireland proves that toleration is an error, is moreover a question of more than speculative interest to Americans no less than to Englishmen. Mr. Froude's confidence in his theories is unbounded. The constant assumption made throughout his work, that the history of Ireland supplies the practical confutation of liberal doctrines, impresses the imagination of his readers almost with the force of argument, for not one in a hundred considers whether the facts, even as told by Mr. Froude, support Mr. Froude's conclusions. The object of the present article is (omitting all the other interesting questions raised upon Mr. Froude's last work) to consider whether events have really proved that the policy of intolerance was, in Ireland at least, wiser than the policy of toleration.

No candid enquirer can dispute that the hopes of Grattan and of the greatest English and Irish statesmen of his day have not been entirely fulfilled. The penal laws have been abolished and Irish Catholics now enjoy the full rights of citizens, yet no one can pretend that Ireland has become a contented country or that Catholicism has ceased to be an aggressive and intolerant creed. Not Grattan alone, but every statesman of the time, believed, and believed with apparent reason, that Romanism was a superstition which was losing its hold on mankind, and would die out under the influence of enlightenment and progress. The experience of the last fifty years shows that this view was in part a mistake. The generation who have witnessed the Œcumenical Council know that delusions which have their roots in the weaknesses of human nature, and are upheld by the tradition of cen-

* 'The English in Ireland in the Eighteenth Century. By J. A. Froude, M.A.' Vols. II. and III. London: Longmans & Co.; New York: Scribner, Armstrong & Co.

turies, will die (if they die at all) as slowly as they have grown up. Not only is Catholicism not dead, but it has in appearance gained new force and audacity. At the end of the last century, it only asked permission to live. The question now is whether it will suffer other creeds to exist. All this and much more (if necessary) may be granted to the school of writers whom Mr. Froude represents. But to concede that the Papacy commands far greater power than at the end of the last century any one supposed it to possess, goes but a very little way towards showing either that the views of Grattan or that the general policy of toleration was grounded on error. Mr. Froude's facts support three conclusions which are fatal to his theories. They show that the system of Protestant ascendancy was tried and failed; that the whole policy of Grattan had, if it had been fairly tried, a fair chance of success; and that the portion of that policy which has been tardily carried out has achieved if not brilliant yet satisfactory results.

The scheme of Protestant ascendancy turns out, on Mr. Froude's own showing at least, as impolitic as it was unjust. Its aim was to crush Romanism and to bind England and Ireland together. Romanism was not crushed, and after a century of Protestant rule the English colony rose in arms to extort independence from England at the very crisis of her fate. If it be urged that the system broke down because it was not fairly carried out, and that Protestant ascendancy might have succeeded if carried out in the spirit of Cromwell, the reply is not far to seek. Cromwell's policy was a far juster system than any which for generations succeeded it, because the Protector was, if a tyrant to the Catholics, a perfectly just ruler to all classes of English settlers; but like every other policy it must be tested by its results. It was not kept up, and there is no proof that it could, England being what it was, have been permanently supported. The penal laws, it may be urged, were not strictly enough enforced. This plea is their severest condemnation. They were not enforced because they were opposed to all the best instincts of human nature; but not being enforced, they stimulated, if they did not produce, that contempt of law which was in the last century the characteristic of Irish Protestants no less than of Irish Catholics. Absenteeism, it may be said, did Ireland far greater injury than the penal code. Let this be granted for the sake of argument. It will not avail the supporters of persecution, for absenteeism had its roots in the system which excluded the mass of Irishmen from ownership of the land and gave large estates to landlords whose home and interests were in England. The atrocities of '98 seem to Mr. Froude the condemnation of Catholic emancipation. To most persons they appear the condemnation of a system which made Mr. Thomas Fitzgerald the hero of one class and Father John Murphy the hero of another. "But," (it may be said, and this appears a line of argument which Mr. Froude is inclined to adopt,) "the Irish Parliament was the source of Irish calamities." Unfortunately for this assertion, the Parliament was abolished and Protestant ascendancy was maintained. From 1800 to 1829, the policy of George the Third was carried out to the full. It came to an end because its continuance would have caused a civil war which the Duke of Wellington was not prepared to provoke. The forcible suppression of a national movement is apt to appear a much more serious thing to a trained soldier than to writers who feed their imaginations on pictures of slaughter and executions in the quietness of the study.

Of the failure of Protestant ascendancy to secure its objects it is possible to speak from experience. Speculations as to the success of Grattan's policy must rest on conjecture. His schemes were never more than partially carried out. He and his English allies advised timely and ample concessions. No one but a madman ever advised that concession should first be promised and the promise be broken at the very moment of expected fulfilment. The Fitzwilliam crisis explains the movement of '98. It is simply ridiculous to make Grattan responsible for results which followed from his policy's not having been followed. His schemes no doubt might under any circumstances have ended in failure. The question is whether between 1782 and 1792 it might not have been possible to induce Irishmen to merge religious and class distinctions in common national feeling. Calm observers may hold that Grattan's idea of an Irish nation could never have been realized. The penal laws and the confiscation of estates with which they were connected had perhaps formed divisions which nothing but length of time could obliterate. But it may fairly be noticed that Grattan had several circumstances in his favor which are now forgotten. The Volunteer movement had been a national movement, and had excited genuine patriotic sentiment. The progress of the French Revolution made the priests disinclined towards violent democratic schemes, and, if not actively loyal, at least disposed from interest to support the English connection. If the Catholics had, at a time when religious men of all creeds looked upon the revolutionists as common enemies, received full civil rights, there is reason to suppose they might have become loyal citizens. The animosity which had once existed between Papists and Protestants had sensibly declined, as may be seen from the fact that the authorities of Trinity College were prepared to go a great way in meeting the demands of Catholic students. When Grattan dreamed of an Irish nation, the people had not yet been divided into irreconcilable factions by the animosities and recollections of '98.

Part only of Grattan's policy was carried into effect, and that portion was not carried out either in the mode or at the time he counselled. Emancipation in 1829 was a different thing from emancipation in 1792 or even 1800. In spite of the warnings of Burke, it followed instead of preceding the Union. In 1792, the priests feared France, and the Pope was in effect the ally of England. The Catholics had not yet learned their power. The Catholic priesthood were in part affected by the tolerant doctrines of the eighteenth century. In 1829, the tide had turned. The Papacy was preparing a career of aggression. Ultramontane doctrines were spreading throughout the Catholic world, and the Papists of Ireland had found a tribune of their own religion. If the measures of 1829 have failed, it is impossible to argue from their failure that the policy of Burke and Pitt must also have failed if tried in due season. To the obstinacy and cunning of George the Third it is due that the Union was not associated in the minds of the Catholics with the acquisition of political rights. Mr. Froude's new hero lost England both the American colonies and the best opportunity which has ever occurred of reconciling Ireland to the British rule. But the policy of toleration, tried as it was under every disadvantage, has not failed. To expect gratitude from human beings for the mere concession of their just rights is folly. Nor is gratitude a feeling ever experienced by one nation to another. To expect, again, that the removal of one grievance will take away the feelings generated by grievances of a different kind is absurd, and Mr. Froude, in pointing out as he has done the numerous evils under which Ireland has suffered, fully explains why the removal of religious disabilities alone did not at once put an end to discontent. A peasantry suffering under unjust land-laws cannot be expected to become loyal subjects simply because they have ceased to suffer from the penal code. What may be expected from one measure of justice is, that particular discontents be removed or lessened. No one who forms simply just expectations of the results to be attained from remedial legislation, will feel disappointment at the effect of the policy of toleration. The Ireland of to-day is not a credit to English statesmanship, but the Ireland of to-day is, on Mr. Froude's own showing, a far more prosperous and far less discontented country than the Ireland of 1800. Irish history, tell it how you will, is a melancholy record of human tyranny and folly. No sane student can believe that any policy whatever can remove within one or two generations the ill results of centuries of misgovernment. What a critic unblinded by partisanship or love of paradox can perceive is, that the last course which prudence suggests for the remedy of existing evils is to revert to a forsaken policy and attempt to rekindle the spirit of Protestant ascendancy when the grounds which explained, if they did not excuse it, have ceased to exist. Grattan's anticipations were not in all points realized, but no advocate of the doctrine that might makes right can, whatever his literary skill, ultimately conceal the fact that the noble toleration of Grattan was far more prudent, as well as far more just, than the bigotry and intolerance of Charles Sheridan or Fitzgibbon.

OWENS COLLEGE ESSAYS AND ADDRESSES.*

THE perusal of this goodly volume suggests the question whether it might not be well for some of our leading universities to publish now and then specimens of lectures, instead of examination-papers, by way of giving some idea of what they are capable. The capabilities of this new English college are advantageously shown by these professorial essays. The college was founded on the bequest of John Owens, merchant, in 1851, was reconstituted and incorporated by Act of Parliament in 1871, and its new buildings were formally opened in the autumn of 1873, by the Duke of Devonshire, the president. From his brief and pertinent address, prefixed to the volume, we learn, among other things, that the founder was wise enough to forbid the use of any portion of his bequest for building purposes. Whereupon the citizens of Manchester, as they ought, took this matter in hand, and supplied the needful buildings at a cost of somewhat more than a hundred thousand pounds, thus giving their college a fitting local habitation without diminution of the endowment. The first address in this commemorative volume (following the brief and modest one of its titled president) was delivered upon the occasion by the Principal and Professor of Greek, Dr. Greenwood: "On some Relations of Culture to Practical Life." Published at the time in some of the literary and scientific journals, it had attracted our attention, and we copied some passages in which the importance, and the

* 'Essays and Addresses by Professors and Lecturers of Owens College, Manchester. Published in commemoration of the opening of the new college buildings, October 7, 1873.' London and New York: Macmillan & Co. 1874. Pp. 560, 8vo.

grounds of the importance, of a common groundwork of culture for all students were set forth.

In the essay or lecture which follows, upon "Original Research as a Means of Education," another and a different but not really antagonistic view is maintained by Professor Roscoe, the chemical professor. The presentation of the educational advantages to be gained by original scientific research relates mainly to chemistry, as is natural, and the case is admirably put. But it is curious to notice that while the professor believes "that, from the nature of things, chemistry serves better than any other science as a field for calling into active exercise the abilities which original investigation undoubtedly promotes," it is commended because of the ease with which in its present state even the young student may do original work in it of a certain importance; whereas in literary and classical subjects, to make any real progress demands far more and wider knowledge, "and thus investigation leading to any new results is out of the young student's reach, and necessarily confined to mature and master minds." That is, comparatively small and narrow knowledge, specially directed, will tell far more in chemistry than in philology, logic, or history. The kind of discipline is undoubtedly good, and the attendant advancement of knowledge is so much gain; but the easier and the more special the work, the less, perhaps, its educational importance. We should say that one great educational value of chemical and physical research is the habit it gives, or ought to give, of dealing closely with facts.

"Solar Physics," by Prof. Balfour Stewart, the third of the series, is lucid and brilliant, as befits the topic; and, indeed, is one of the best elaborated as well as the liveliest of popular scientific expositions. No one can well read it without getting a clear idea of what is known and inferred as to the physiognomy of the sun, the nature of sun-spots, and the relations of the sun to terrestrial changes. Some remarks at the close, bearing upon the question of intelligence in the universe, are more subtle. Referring to the conclusion that the sun's atmosphere, as well as that of our earth, is in a delicate state of equilibrium, so that a very small cause may often produce a very great effect; that delicacy of construction, implying instability, is essential to animal life, without which, without pretending to know what life is, we may feel assured that it cannot exist; and that, as "we perceive in the universe generally, as well as in our own frames, the existence of such delicacy, the question naturally occurs: Can the universe in any sense be regarded as an animated structure in which, as in our own frames, intelligence may assume great freedom of action without the subversion of the fundamental laws of energy?" The answer may help non-physicists, and some physicists as well, to a clearer conception of what is involved in certain mooted questions of the day:

"While we cannot, from the physical point of view, pretend to reply to this question, we should yet wish to indicate what is conceived to be the true position of physical science with regard to it.

"In the first place, it is very difficult to separate the physicist from the man. I see one man shoot another, but what do I see as a physicist? Why, first of all, I recognize a conversion of the energy of the gunpowder into the visible energy of the bullet; going back a little further, I trace the bestowal by means of the forefinger of a certain amount of energy upon the trigger; going back a little further, I know that this bestowal of energy denotes a certain consumption of muscular fibre, and also a certain minute change in the matter of the brain. Thus, as a physicist, I can only arrive at a physical antecedent. . . . But yet I know as a man that the act was a foul murder, and will do my very best to bring the murderer to justice, whatever be my ideas with respect to the position of life in the universe of energy. Thus as a physicist I recognize the delicacy of construction which appears to be necessary to the embodiment of intelligence, but I cannot tell whether intelligence be there or not. My reasons for believing that it is there have nothing to do with physical science; they are derived from the consciousness that I myself exist, and from the conviction, derived from powerful reasons of an analogical nature, that my fellow-beings are similar to myself.

"But, again, when we regard the varied motions of an animated being, we find that these are of two kinds. Some are as nearly as possible mechanical, as, for instance, the beating of the heart and the circulation of the blood, which are not even spontaneous, and certainly convey no moral meaning whatever; others again are spontaneous, and convey unmistakable indications of a moral agent. Now, in the universe also there are certain motions that are strictly mechanical. . . . . Unquestionably there is no moral significance in such motions. If the moon crosses the meridian when we do not expect her, what do we do? Why, only revise our calculations. But it has been shown in this essay that there are other motions of the universe associated with that element of delicacy which does not characterize the orbital motions of the heavenly bodies. Now, if a physicist be asked whether he has any reason to associate these motions with the spontaneous acts of intelligence directing these motions after a manner similar to that by means of which our intelligence directs our motions, his reply will be that he cannot tell. Recognizing the principle of delicacy, he may have no objection to urge; but the reasons for or against such an hypothesis must be derived from other sources, and the battle must be fought with other weapons than those of the physicist."

"The Distance of the Sun from the Earth," by Prof. Core; "The Limits of our Knowledge of the Earth," by Mr. Dawkins; "The Use of Steam," by Prof. Reynolds, are the remaining physical topics. The only natural-history lecture is by Prof. W. C. Williamson, who discusses "Primeval Vegetation in its Relation to the Doctrines of Natural Selection and Evolution." The discussion is rather negative in its results, and the lecturer is cautious of drawing absolute conclusions, evidently regarding evolution somewhat as the canny Scot regarded Rob Roy—as "owre bad for blessing, and owre good for banning." "Science and Medicine," by Prof. Gamgee, is mainly historical. Prof. Wilkins presents some historical results of the "Science of Language," Prof. Theodores discourses at length upon "The Talmud," Mr. Breymann on "Provençal Poetry," Prof. Bryce, who occupies a chair in the Manchester college as well as at Oxford, on the "Judicature Act of 1873 in its Relation to the Judicial System in England." Prof. Jevons discusses "The Railways and the State"; Prof. A. W. Ward, "The Peace of Europe."

THE MAGAZINES FOR AUGUST.

IN *Lippincott's*, Dr. S. Weir Mitchell writes of the "curious lowering of tone" which American health undergoes every spring, of which little or nothing is said in our books of medicine—these being often in good part European—but which, in old times not yet passed out of the memory of the middle-aged, used to lead to many bleedings and to dosing with physics of various strength, from calomel to dandelion beer. Spring sickness was the name for this spring-time indisposition to work, accompanied by an inability to get any good from one's food and a general lowness of spirits. One cause of it, Dr. Mitchell thinks, may be the malarious element which is operative over so large a part of the country, and he thinks it would be well to make enquiry whether in older countries free from ague-poison the breaking up of the winter weather is thus capable of pulling down people's strength. But what he is inclined to think a far more widespread and efficient cause of this trouble of the spring, is the nervous wear and tear of the winter preceding. All over America, he remarks, the time of the most severe and steady labor is from early autumn up to late spring—or, as he ought to have said, up to the time when early summer has gone. Of course it is of the professional, mercantile, and manufacturing classes that this is said—persons whose labor puts their nerves rather than their muscles under stress; and we may remark in passing that the fact that the farmer also undergoes his spring change as well as the broker, and needs his dandelion beer, does not really militate against Dr. Mitchell's argument. Confirmation of the theory which primarily connects the spring lassitude of our city-men with the state of their nerves, the doctor finds in some statistical evidence which he has gathered in Philadelphia, in regard to the nervous disease called chorea, a disease once bearing the better-known name of St. Vitus's Dance. A great number of choreal cases, he says, are subject to relapses, and from an examination of the records of some years at his clinic it was found that not only do the relapses occur in spring, but also that a vast proportion of the new cases take place at that season. This is striking, because chorea, according to our author's assertion, has no relation to malaria, and is a complaint which any enfeebling causes are apt to evolve. Whatever the correctness of his diagnosis, Dr. Mitchell goes on to prescribe a course of treatment which ought to be enough for a long and grisly train of maladies and taints. It is, in brief, that the tired-out man, suffering from one or another of the ailments of over-civilization, shall throw himself into the lap of barbarism—go into the forest, catch the fish he eats, sleep under hemlock branches, get up from sleep at sunrise, go to bed fatigued with travel or food-getting at eight o'clock, sleeping a dreamless sleep and rising to the mindless pleasure of the simplest of camp existences. The camp-cure this is called, and doubtless several thousands of our fellow-citizens, following the light of unassisted nature, are even now employing themselves as Dr. Mitchell recommends. He mentions half-a-dozen regions where camping out may be done; but apparently his heart goes out most readily to the shores and woods of Lake Superior. He speaks well also of the Maine woods—despite the black fly—and of the noble St. John River. Of the more accessible Adirondacks he says less, they not being much known to him personally; but he mentions the advertisement given them some years since by a Boston clergyman—one of those apostles of liberty who have been at such a premium of late years, and whose grand freedom from the shackles of systematic theology, and of good sense, and of unsensational truthfulness and modesty the public is now beginning to take a closer look at than it has taken for years, and to judge of with its eyes open. "The Adirondacks woods," says Dr. Mitchell, "have been pretty fully advertised in a work of fiction by a reverend gentleman in Boston, who describes trout as leaping some few feet out of water, and who shoots loons with a rifle from a rocking boat in a thunder-storm at night by the lightning-flashes."

This month's *Lippincott's*, besides the article by Dr. Mitchell, contains

one by Mrs. Fanny Fenwick, which breathes of tropical climes indeed in its glowing description of Eastern fruits and flowers, but breathes also of sherbet, and lemon groves, and that Indian punkah to which one of the *Nation's* valued contemporaries has at one time and another done so much to call public attention. Mr. William Black this month begins his new serial story, which bids fair to be like most of his other late stories in being made up of love and natural scenery. Picturesque Cornwall is Mr. Black's locality this time, and, as it has not yet been much described, our author's fault of too frequent description and of descriptive diffuseness will probably be less of a fault than usual. As for his principal characters, for two among them we have the familiar figures of the spirited young man in the strength and freshness of youth, and the young woman as constructed from the honestly respectful, rather romantic, masculine point of view. Mr. Black's habit of interpolating his story with scraps of old songs he still indulges in, and the reader, if almost willing to pronounce it a mannerism, is certainly unwilling as yet to condemn it, for it still gives pleasure; but, nevertheless, he would welcome some signs of a more restrained and frugal use of the device. When Miss Bell in the twilight sings "Lochaber no more," or when Sheila, the Princess of Thule, in like manner emphasizes a mood of the sea or of the sky or of her companions with an answering strain of music, it is seen to be very well. But so much cannot be said when in a third novel our author takes a new collection of songs—English, say, instead of Scotch—and proposes to move us for the third time in the same way. As it happens, too, there is an instance of a lowering of the method of management—an instance, perhaps, indicating that the device is felt to have been already hard-worked. This is when Miss Morwenna has proposed to her a very prosaic sort of a marriage, whereupon her song of "Wapping Old Stairs" comes into her head, somewhat to her amusement:

> ". . . Nor your Molly forsake,
> Still your trousers I'll wash, and your grog, too, I'll make."

We have referred to one or two of Mr. Black's faults, or tendencies to faultiness; we have done so partly because we do not recollect that we have at any time spoken in much detail of his writings, they having usually first come to us in the form of magazine literature, and received then an incidental but regular mention. This "Three Feathers" bids fair to be as clever as the best of his productions. Mr. George MacDonald's "Malcolm" proceeds towards its end. The "New Hyperion" in this stage of its progress lends itself kindly to a drowse, and may be called good summer reading. Mount Desert is praised and half-described by a person who has spent a season there; and the only love-story in the August *Lippincott's* is noticeable for a slight but effective modification of a well-known invention—that of terminational aggrandizement. Thus, Fenwick is Fenwicke, and Althorp, Althorpe.

In the *Catholic World* there is a better maintenance of the undisturbed average of merit than is common in the August magazines; but there is not much to tempt the unsectarian reader. Of this little, Mr. De Vere's "Antar and Zara" may be counted a part, and another part is a story from the French of Ernest Hello, who, after some rather meaningless construction of machinery, endeavors to impress upon us the truth that a so-called innocent man may feel remorse for a crime which he has never committed. That is to say, he may never have materially committed a murder, and yet may be haunted by remorse for that crime, and even goaded by the ghost of a supposed victim into insanity itself. But, if our philosopher reasons well, this sufferer from remorse is not innocent. He has probably committed a real and spiritual crime, which, although forgotten, madness seizes hold of and transforms into an actual crime of which he believes himself guilty. In other words, the sub-conscious memory of a sin causes him to go mad and to believe himself guilty of an offence against the law. All this is sufficiently fine-drawn; and we could have for it, at best, only the testimony of lunatics. But unwise and useless as this story is, it is managed in some of its points with a cleverness entirely unlike that of our American story-tellers; the main structure, however, is as far from being successful as the spirit of the plot from being a lifelike spirit. "A Glimpse of the Green Isle" continues to be easy to read. The writer has got as far as from Queenstown to Dublin, and this is one of his observations by the way:

> "The Irish in Ireland are becoming a serious people. I do not meet a single specimen of the Irish joker indispensable to the tourist in Ireland a quarter of a century ago. If he ever existed as they represented him, the railways have killed him." Again, "The traditional costume of the stage Irishman is as rarely seen in Ireland as the short-waisted, long-tailed coat, and striped trousers of the stage Yankee in the United States. I saw but one pair of knee-breeches between Cork and Kingstown. I did not encounter a single shillelah."

Our author thinks the gravity of the people to be due to their increased means of bettering their condition, either by going abroad or by staying at home and working for the better wages now everywhere paid both to skilled and unskilled workmen. The examination of the validity of Anglican orders is carried on from last month, and so is the "Discussion with an Infidel"—Büchner namely. Büchner still displays his "clumsy sophistry and shameful contradictions," and unconsciously shows up his companion believers in force and matter to be "infidel scribblers and designing knaves."

In *Old and New* there is an article, one of a series, by the Rev. James Martineau, who enquires into the reasons for thinking that the fourth Gospel was written by John, and argues that for all reasons it nohow could have been so written, nor in fact by any of the inner circle of the disciples. The arguments as presented by Mr. Martineau are put with clearness and with as much calmness as force. In the same magazine a story with a faint resemblance to the stories gathered among the abbeys of Touraine, is told by a Bishop Ferette; its title is "The Old Capuchin and the Young Carmelite," and the reader will be apt to think that any magazine would be as well off without it as with it. "Our Sketching Club" is an essay of the deadly-lively vivacious order, but Mr. Ruskin vouches for the soundness of what its writer says about drawing and sketching. In the "Record of Progress" there is some account of the schools for the training of nurses—both of those which are more especially English schools, including Florence Nightingale's, and the American school in New York. The school in this city has twenty-six pupils, who do the nursing in five of the Bellevue wards, and it has branches in active operation in Boston, Philadelphia, and New Haven. In Boston there are fifteen pupils, who also serve in the hospital wards. This is regarded as the best sort of training for them. Miss Nightingale has thus estimated the value of such training and the relative value of the different kinds of nurses. It is a subject on which much more is said than is known, and, of what is said, much is said with great positiveness:

> "With regard to an oft-disputed question whether it is desirable to train probationers entirely in a *public* hospital, I should say, without hesitation, it is there *only* that they *can* be trained; and every well-judging superintendent will tell you that the students, governors, steward, etc. (disagreeable as the collisions with them sometimes are), are the most valuable assistants in the training of her nurses. Whether in opposition or in kindness, she hears of all their shortcomings through the secular bystanders, which she would hear of in no other way. I have rarely known a nurse worth the bread she ate, whether religious or secular, whether Roman Catholic nun, Lutheran deaconess, Anglican sister, or paid nurse, who had not been trained under a hospital discipline, consisting partly of the secular man authorities of the hospital, and partly of her own female superior. I don't know which is the worst managed—the hospital which is entirely under the secular men heads, or the hospital which is entirely under the superior of the nurses, whether religious or secular, whether male or female."

In another part of the "Record of Progress" there are two or three reports from Bostonians who have had under consideration the subject of providing amusements for the poor. It was a sub-committee of ladies that first reported. They found that the persons for whom amusements would have to be provided, if at all, are mostly the Irish of the large cities and towns. But they found also that up to the time of the investigation, at any rate, this class had provided itself with amusements—these having been chiefly derived from drinking together and then fighting with each other, and this not only in America, but in all probability in their former home beyond the sea. Yet plainly it is a pleasure to them the committee also, think, to listen to each other singing old songs and telling stories of ancient times. "We have all," they say, "overheard the unending rigmaroles, which seem to have unfailing interest, of some elderly digger or ditcher"; and they think that the persons who are auditors on these occasions might with a little pains be drawn into public halls where they would listen at first to legends culled from "what they fondly call their national history," and afterwards could be led on to hear about passages from American history such as should stir their hearts. One such might be the daring of Putnam; another the romantic exploits of Marion; another the dash of Light-Horse Harry. Kindling their feelings with these, they might by-and-by "rise to the contemplation of that magnanimous and dauntless man who out of thirteen States made a nation." It is conceivable also that on the 22d of February the use of Faneuil Hall might be granted by the city government: should that be the case, the evening's amusement might begin "with an historic tableau of Washington crossing the Delaware (in every generation there is some man who looks like Washington)"; then some high-spirited, sweet-voiced person might recite parts of Longfellow's "Building of the Ship"; then a tableau from "Rich and rare were the gems she wore," etc., etc., etc. This is all curious as a Bostonian notion of how you are to produce good, rational, platform, transferable-ticket amusements for the people of a nation. The reader will observe, too, the friendly, sympathetic way in which the sub-committee speak of the drinking, fighting people who have what they "fondly call a national history." No wonder the comment which comes from Indiana on this hopeful report enquires if the idea of amusement for a people

MALDEN PUBLIC LIBRARY

does not involve the necessity of something which can be done by the people themselves. More sensible views than the sub-committee's are to the effect that free music-halls are a good means of amusement, and that these should also offer their visitors an occasional dance, song, or recitation, and should supply refreshments at a cheap rate. This is a New York view. A second Boston opinion is also favorable to what the holder of it would call free club-rooms, well warmed and lighted, and affording the materials for playing easy and pleasing games. But we are not long in coming on this latter lady's blackboard and chalk. Once in so often, she says, she would invite in "such a man as Professor Morse of Salem, or the late Professor Agassiz, whose skill with the crayon could make, by catching the eye, the dull understanding grasp pleasurably even scientific subjects." Mr. Gahagan, however, long before he had taken in any of the marvellous beauty that is revealed by modern chemistry, or had received more than his second electrical shock, would have heard so much over at the other lecture course about Brian Boru, and Putnam and the bloody British, as to be well on his way to the Canada line as a Fenian contingent. Nothing in all this scheme appears to be praiseworthy except the intention; and that does not seem unalloyed when we note the unconsciously condescending tone of some of the ladies.

The *Atlantic* opens with a sketch of a Northumbrian fishing town close beside the Tweed, and inhabited by a people of a character as much Scotch as English—hardy, drunken on occasion, great searchers of the Scriptures many of them, as superstitious as brave, and of the simplest sort of lives. Many a primitive bowlder long stood here. We must refer the reader to the sketch itself, which is entirely unpretentious, bears every mark of truth, is as interesting as a stormy day with a veteran Marblehead fisherman might be, and deserves to be read better than almost anything else in the month's magazines. We will, however, quote a few words. We must premise that "a Grinder" is a person who lives in a small hamlet a little distance to the north of the village, and whom the villagers hate desperately and without intermission. We must further premise that a sea-dog is a fish of the bigness of a cod, but more voracious than the grave, which destroys herrings by the school and even attacks the nets and tears out the captive fish. The story runs as follows:

"One of the fishermen, a regular attendant of the Presbyterian church, being on his death-bed, his friends, anxious for his future welfare, thought to ask him some questions in regard to his spiritual condition.

"'Weel, Rab, ye're dyin', ye ken?'

"'Ay, Jamie, I'm gaun.'

"'An' where d'ye expect t' gau t'?'

"'I dinna ken, Jamie, bit I wad like t' turn int' a sea-dog an' plunder the Grinders' nets.' And thus he died!"

In *Scribner's* there is a good article on Georgia by Mr. Edward King, who does not let himself be blinded to the shortcomings either of whites or blacks, but who writes hopefully of the "Yankees of the South." Their rehabilitation however is not an affair of to-day nor of to-morrow, and this Mr. King makes the reader see. Another article is about Mr. Sumner, written by his private secretary, and full of matter having a certain kind of interest, especially for Mr. Sumner's friends. About the secretary's powers of judgment and fitness for such business we do not know: we observe that he thinks it worth noting down that Mr. Sumner really verified the classical quotations in the revised edition of his speeches. The general subject of the late senator's character is treated of in the editorial department of the magazine, and with a discrimination which will prove more common as time goes on.

The *Galaxy* for August is light reading. Mr. Albert Rhodes writes, as thinly as usual, about About; a writer, signing himself Launce Poyntz, proves General McClellan to have been a feeble and almost good-for-nothing soldier, General Lee an inferior soldier in attack though good in retreat, as an engineer officer should be, and General J. S. Johnston much the superior of either of them, and worthy to rank in the class of great second-rate commanders, such as Turenne, Wellington, and Sherman. Our author appears to be commendably sure that he is right, and that being the case goes ahead accordingly, and at a great rate. We can commend, as helping one to a glance of discernment over our historical past, an article by Mr. Henry W. Frost, entitled 'How they lived before the Revolution.' The writer has, perhaps, put into one article what might with good husbandry and a little more fulness of matter have made two or three, and in any case it would not be disagreeable to hear from him again. Mr. R. G. White discusses the use of "shall" and "will," and incidentally digs up from a far part of the yard the old bone so often growled over by himself and Mr. Fitzedward Hall. He soon drags it away and buries it, however, to the gratification of the reader, and goes on coherently. Illustrated articles on Newport, Mexico, the Canadian boundary line, and the American railroad generally considered, fill up more than half of *Harper's Magazine*. They all are good, or good enough, but the one on American railroads, if read and believed in, is sufficient to make one acquiesce with resignation if not with cheerfulness in one's destruction or mutilation by an accident on the road. The dangers, the responsibilities, and the admirable bearing of them by the great army of engineers, conductors, brakemen, station-hands, and other employees, are shown to the reader in a new light, and the article is worth reading.

RECORD OF MR. ALCOTT'S SCHOOL.

Exemplifying the Principles and Methods of Moral Culture. With a cut representing the interior of Mr. Alcott's School. 16mo, price $1 50.

"The readers of 'Little Men' will recall with delight the school at Plumfield, but perhaps most did not know that that happy picture was founded on the actual schools of Miss Alcott's father. . . . It is a unique contribution to the literature of education, which, as such, addresses itself to all teachers and parents; but it is also exceedingly valuable to the psychologist and general student, as exhibiting most remarkably the imaginative and other powers of the infant mind when induced to expression by a competent adult sympathy."—*N. Y. Mail.*

THE WEEK IN TRADE AND FINANCE.

NEW YORK, July 27.

MONEY has remained extremely abundant during the week at 2½ per cent., with occasional loans at 3 per cent. On Saturday money was loaned as low as 1½ per cent., while to-day it is offered freely at 2 per cent. per annum for a week. The bank statement on Saturday was favorable, and showed an increase of $420,075 in the net surplus reserve. The following gives the changes in the different items:

	July 18.	July 25.	Differences.
Loans	$285,315,000	$284,168,100	Dec.. $1,146,900
Specie	27,755,300	26,646,700	Dec.. 1,108,600
Legal tenders	61,853,700	63,714,800	Inc... 1,861,100
Deposits	242,983,600	244,313,300	Inc... 1,329,700
Circulation	25,727,500	25,767,600	Inc... 40,100

The following shows the relations between the total reserve and the total liabilities:

	July 18.	July 25.	Differences.
Specie	$27,755,300	$26,646,700	Dec... $1,108,600
Legal tenders	61,853,700	63,714,800	Inc .. 1,861,100
Total reserve	$89,609,600	$90,361,500	Inc.. $752,500
Reserve required against deposits	60,745,900	61,078,325	
Excess of reserve above legal requirem'ts,	28,863,100	29,283,175	Inc... 420,075

In the stock market the interest has centred altogether in Lake Shore. The directors of the company wisely decided not to pay any dividend to the stockholders in August, the excuse for not doing so being that the road had not earned one. The directors, however, have made a statement of the earnings and expenses for the six months ending June 30, and express the hope that it will not be necessary in future to omit the payment of dividends. The statement is as follows:

Earnings		$8,674,839
Operating expenses (including cost of steel rails, substituted for iron), and taxes (equal to 66 per cent. of earnings)		5,608,993
		$3,065,846
Interest, Leases, and Dividend on Guaranteed Stock	$1,380,000	
Discount on Bonds sold	190,000	
		1,570,000
		$1,495,846
Leaves equal to 3·025 per cent. on capital stock.		
The above amount has been expended for the following purposes:		
On construction	$263,770	
On equipment	626,686	
		$890,456
All this was under contracts made by the previous administration prior to June 30, 1873, which contracts are now all closed.		
For payments on floating debt		605,390
		$1,495,846
The present floating debt is		$2,100,000

The reduction therein since January 1, 1874, other than by earnings as shown above was from proceeds sales second mortgage bonds.

There is a difference of opinion as to the propriety of not adding the $890,456, spent on construction and equipment, to the "operating expenses," but as this would have shown that a dividend of only a little over 1 per cent. had been earned on the stock, we can understand why it was not so stated. There was some little activity in the Pacific Mail upon news having been received of the loss of a steamer. The price of the stock fell off about 1 per cent., but almost immediately recovered, when it was known that the company's loss was fully covered by insurance.

The investment stocks have been almost lifeless, and brokers who make dealings in that class of securities their special business say that they have never had so little inquiry for them as they have had during the present month, when the large disbursements of money by the Government and corporations place in the hands of people the funds which they have heretofore reinvested in sound dividend-paying stocks. There has been a light demand for Lackawanna at 107 to 107⅜, and for New Jersey Central at 105⅜. Chicago, Burlington, and Quincy has sold at 105, the demand for it coming from Boston, where the road is chiefly owned.

The following shows the highest and lowest sales of the leading stocks at the Stock Exchange for the week ending Saturday, July 27, 1874:

	Monday.	Tuesday.	Wed'day.	Thursday	Friday.	Saturday	Sales.

Nothing official has come to hand at this writing in relation to the Treasury award of new 5 per cent. bonds, for which the proposals for the remaining unsold $179,000,000 were opened on the 23d inst. Some $10,000,000 were awarded at par and accrued interest, and the Treasury Department is now considering an offer made by a syndicate, composed of American and foreign bankers, for $55,000,000, with the privilege of taking any part of the balance at the same price within a certain length of time. Exactly what time is asked for is not definitely known, but is supposed to be twelve months. The Treasury considers the time which the syndicate asks as too long, and at present the two parties are endeavoring to arrive at some sort of a compromise.

Pending the settlement of the Government sale of new 5's the market has been very dull, the dealers not being disposed to purchase until the transaction is closed.

The market closed steady at the following quotations this evening:

	BID.	ASKED		BID.	ASKED
Registered 6's, 1881, c	118⅝	118⅞	Registered 5-20, 1867, c	117¾	117⅞
Registered 5-20, 1862, c	113¼	113½	Registered 5-20, 1868, c	118¼	
Registered 5-20, 1864, c	115¾	115⅞	Registered 10-40's, c	113¾	113¾
Registered 5-20, 1865, c	116⅞		Registered 5's, 1881	113½	113¾
Registered 5-20, new, 1865, c	116⅜	116½	U. S. Currency 6's	117⅞	

The fluctuations in gold have been confined between 109⅝ and 110¼. There has been a total lack of any speculative spirit, and the market has been left to itself. The following shows the daily range of quotations:

	Opening.	Highest.	Lowest.	Closing.
Monday, July 20	110¼	110¼	110¼	110¼
Tuesday, July 21	110¼	110¼	110	110⅛
Wednesday, July 22	110	110¼	109¾	109⅞
Thursday, July 23	109¾	110	109¾	109⅞
Friday, July 24	109⅞	109⅞	109⅝	109⅞
Saturday, July 25	109⅞	110	109¾	109⅞

ALBERT MASON,
129 GRAND STREET, NEW YORK,
PUBLISHES

THE ANNUAL OF SCIENTIFIC Discovery. A Year-Book of Facts in Science and Art, exhibiting the most important Discoveries and Improvements in Mechanics, Useful Arts, Natural Philosophy, Chemistry, Astronomy, Meteorology, Zoölogy, Botany, Mineralogy, Geology, Geography, Antiquities, etc. With minute Index of Subjects. Edited by David A. Wells and Samuel Kneeland, M.D.

This important work consists of 21 vols., and is sold either in sets or by single volume. Price, in cloth, $2 per vol.

A new volume will be issued early in the spring of 1875.

WORKS OF LORD MACAULAY, comprising Essays, History of England, and Speeches and Poems. Riverside edition, 16 vols., $32; Student's edition, 8 vols., $16.

WORKS OF JOSEPHUS. Library edition, 4 vols., $9; Popular edition, 2 vols., $4 50.

FOREIGN BOOKS Reviewed in the *Nation*, and books in all languages, at SCHOENHOF & MOELLER'S, Importers, 40 Winter Street, Boston.

RIFLES, SHOT-GUNS, REVOLVERS of every kind. Send stamp for Illustrated Price List to GREAT WESTERN GUN WORKS, Pittsburg, Pa.

SLAVE SONGS OF THE UNITED STATES:

A Unique Collection of Original Melodies—words and music—obtained among the Negroes of the South; preceded by an Account of these Songs, and an Essay on the Negro Dialect, as observed at Port Royal. By Prof. W. F. Allen, of the University of Wisconsin. Cloth, 8vo, price $1 50. Sent, post-paid, on receipt of price by the Publisher of the *Nation*.

SPECIAL NOTICES.

TERMS: In advance, one insertion, four cents per word; five insertions, three cents per word, each. The enclosure of a stamped and addressed envelope will secure a numbered box, to which communications may be addressed.

An Experienced Principal, College-bred, desires position. Address, stating salary, EXPERIENCE, *Nation* office.

A Vassar Graduate, an experienced teacher, desires a re-engagement. Address Box 12, *Nation* office.

SPECIAL NOTICES.

A Graduate of Brown University, of ten years' standing, desires a position as Professor of Botany or Natural Science generally in some College or similar institution. For information and references of the best character, apply to W. W. Bailey, B.P., Providence, R.I.

German Language.—Having some mornings free, I wish to employ them in private schools, and am now ready to make arrangements for next fall. E. C. F. KRAUSS, 82 Waltham Street, formerly 53 Temple Street, Boston.

Wanted.—By a lady of experience, a position as teacher of English Literature and French. Best references. Address Miss H. L. D., P. O. Box 11, Morgantown, W. Va

Wanted.—A situation as Editoron a Liberal or Democratic paper, by a gentleman of liberal education and some experience. Best of references.—Address box 13 *Nation* office.

Young Ladies' Boarding and Day School, Stamford, Conn. Mrs. C. E. Richardson, Principal. This long-established institution offers advantages equal to the best Metropolitan schools, in the course of its instruction, and in the qualifications of its teachers. School begins Sept. 22. Circulars sent upon application. Refers by permission to Henry Oothout, Esq., 3 Cliff Street, Charles Lamson, Esq., 38 Burling Slip, and Messrs. Baker & Williams, 510 Washington Street.

The Nation.

NEW YORK, THURSDAY, AUGUST 6, 1874.

The Week.

THE principal political events of the week have been the delivery of an important speech by Senator Morton, and the very outspoken call of the Illinois Democratic Committee. The committee did not choose to await the action of the Convention, but endeavored to give commanding advice as to the State platform to be made on the 26th instant. It invites to the Convention both Democrats and Liberal Republicans, and, in general, all men who are "in favor of the restoration of gold and silver as the basis of the currency of the country, the speedy resumption of specie payments, and the payment of all national indebtedness in the money recognized by the civilized world." What success will attend the attempt of the committee to pledge the party in this way remains to be seen; it seems hardly probable that the friends of inflation will surrender the Convention to the resumptionists, but the committee's tone is bold. We observe that its members had in their council Mr. Raster and Mr. Hesing of the Illinois *Staats-Zeitung*, gentlemen supposed to represent with more or less fulness the German vote; and that they also received some advice from the rather flighty ex-Governor Palmer, one of the few Liberal Republicans still extant.

Mr. Morton's speech touched on all current political topics, and as usual did not lack for cleverness. Probably the entire Republican party might be searched in vain for a better specimen than Mr. Morton of the partisan Republican pure and simple; and at the beginning of his speech he gave the audience some of his usual bounce about the treason and folly of the Democracy, and the vigor of the Republicans in themselves purging their party of corrupt men whenever and wheresoever found. The Reciprocity Treaty he took occasion to denounce with as much severity as was shown the measure by Mr. Blaine; and free-trade he scouted in terms which seem so unnecessary for the agricultural communities of Indiana that there is inevitably a suggestion of a wider audience to be reached and captivated. Mr. Blaine, with his usual luck, was not compelled to be so transparent, his locality accounting naturally enough for his protectionism. As for the Civil Rights Bill, Mr. Morton declared that it was no more stringent than a law for similar purposes which is already on the Indiana statute-books, and he pronounced false and baseless the rumor that the President disliked the bill: the President had no fondness for the Southern Democrat. The main burden of the speech, however, was the cheap-transportation question, and next to that the currency. In brief, Mr. Morton thinks that the State governments in their due degree and the Federal Government in its degree have full power to regulate all railroads. But he warns the voter that the problem is a knotty one, and that it must be attacked in a spirit of moderation. On the whole, he thinks the best machinery for performing the necessary regulation would be boards of commissioners empowered to fix rates, prevent the corporations from taking advantage of the hard frosts which close the canals, crush out many other extortionate practices, and so on and so on. In speaking of the currency, the Senator defended inflation, and did a good deal of obfuscatory laudation of the national-bank notes. Last winter's work on the currency he is said in the popular version of his speech to have described as "kicking out of Congress the monster of contraction after expansion had been crammed down its throat."

Senator Windom of Minnesota, in a conversation with a *Tribune* correspondent, perhaps throws some light on the boldness of the hard-money men in Illinois. He says that he never was so much [illegible] political matter as about the opinions of his constituency in regard to inflation. With a curious frankness, he says that he did not think well of inflation at first; he thought it was wrong; but he was given to understand that his people out in Minnesota wanted it, so he changed sides, and voted for the bill which was vetoed, and afterwards for the bill which became law. Now he discovers, to his surprise, that he might as well have behaved a little more like a man: "Since his return to the State, he had found very few who are in favor of inflation," and next winter it will doubtless be more difficult to Mortonize him into "cramming expansion down the throat of the monster of contraction." This same correspondent notes that Minnesota was never more prosperous than now, and that, with the farmers lending money to the banks instead of borrowing it, there is as little need for a cry for more currency as there is for the farmers to ask the railroad companies to carry at reduced rates the twenty-five million dollars' worth of surplus wheat which they sent out of the State in 1873, or the twenty million dollars' worth which they will send this year.

On the question of responsibility for the corruptions and disorders in South Carolina, Mr. Morton was more explicit and logical than in some other parts of his speech. He says in the first place that they have been "exaggerated an hundredfold," though there is still "too much truth in them"; that the Democrats of the State have had just as much share in the frauds and peculations as the Republicans; that "the Republican party of the United States have no other responsibility than this," that they "prevented the dissolution of the Union, abolished slavery, clothed the negroes with civil and political rights, and gave them an equal participation with their late masters in the reconstruction of the State government, which had been destroyed by the rebellion." For the "mental and moral condition" of the negroes, which under the Reconstruction acts has produced all the trouble, "the old slaveholding Democracy is responsible"; but for the fact that the negroes had an equal right to liberty and the suffrage, which the Republican party was forced by its own sense of justice to confer upon them, with whom does the responsibility rest? "The responsibility must be traced directly to the great Creator of us all, who, in his holy Word and throughout his works, has proclaimed the equal humanity, rights, and immortality of all men." This chain of reasoning, simple as it is, is open to the objection of putting too great a burden on the Almighty. There are various degrees and modes of responsibility for the present political condition, not of South Carolina alone, but of the entire South, for some of which the Republican party may take credit to itself, and will permanently obtain it in history. Such are the necessary steps in the suppression of the rebellion, the abolition of slavery, and the extension of political rights to the freedmen, which are capable of being viewed either as voluntary acts of a free agent, or in another light as "acts of God." But the kind of responsibility typified in the President's dealings with Kellogg and Casey is that which Mr. Morton found it convenient to overlook.

Of the actual condition of South Carolina politics, a correspondent of the Cincinnati *Commercial* gives a picture which is distressingly entertaining. It being generally understood that the thieving of Moses is not now looked upon with favor at Washington, a faction of the Republican party in the State is endeavoring to prevent his renomination. Moses, however, is working for his "second term," and is known to have gained great favor with two important classes in South Carolina—"the convicts and the office-holders." He makes no secret of his intentions, but says that as he has a somewhat bad reputation outside the State, being known as "the robber Moses" and "the great South Carolina thief," he wants an endorsement and a vindication from his constituents. What he chiefly cares for is the nomination; for all accounts agree that, as long as the Republican organization in South Carolina is kept intact, the nominee of the convention is sure of an election. The Demo-

crats have no future as a party before them; and, better than all, the negroes have great confidence in Moses, which must be explained by the negro belief that Grant stands by him, and that he represents freedom, jubilee, and the pardoning power. Notwithstanding the fact that he is a white man, an original rebel, that he is the son of a man said to have fired the first shot on Fort Sumter, and is plundering the State right and left, the negroes are profoundly devoted to him, and are entirely unaffected by the howls and clamor of the mob.

The Alabama Democrats have held their convention, and resolved that the Radicals have so inflamed the passions and prejudices of the negroes as to make it "necessary for the white people to unite and act together in self-defence and for the preservation of white civilization"; that the constitutional and legal rights of all must be preserved inviolate; but that Congress has no constitutional authority "to force the two races into social union or equality." They denounce the Civil Rights Bill passed by the Senate, and "all legislative enactments which attempt to convert into crimes the rules and maxims of our social intercourse, to which we are indebted for the excellence and glory of our civilization, or to punish with degrading penalties our refusal to admit an ignorant and barbarous race to equal participation with our families in our social institutions"; "extend to all our race in every clime the right hand of fellowship"; declare that railroad employees in Alabama ought to have liens for wages; demand and pledge themselves to economy in State affairs, to a complete investigation and public statement of the financial condition of the State, the payment of lawful and the repudiation of unlawful and fraudulent claims.

The municipal election at Vicksburg passed off quietly, and there appears to have been no necessity for the Federal interference so unblushingly asked for by the incompetent lieutenant-governor and afterwards by Governor Ames. Undoubtedly there have been for some time the materials for a riot in the city, and we doubt if five years ago a riot must not have taken place had the circumstances been the same. The facts appear to be that the city government has been in the hands of the negroes and a few white men of Radical politics. It is not a rich municipality, and it is said that its debt has been carried up to one-sixth part of its total valuation, and that there has been no indication that the process would stop. On the contrary, when the Radical party nominated its candidates for last Tuesday's election, it is said to have gone further than before, and named a ticket more pronouncedly Radical and dangerous to the taxpayer than ever. This aroused anger on the part of the whites; and some of the negroes are reported as making inflammatory speeches of a kind well calculated to excite the white Vicksburger. Both sides began drilling men, but such of their arms as were public property being taken away from them or forced into concealment, large numbers of the citizens, black and white, took to their private revolvers. This armament seems to have had on the whole a quieting effect—as looking so much like business that it might be as well for neither party to begin hostilities. Then came the requests for troops, and to the satisfaction of the country the Texas precedent was followed instead of that of Louisiana and Arkansas, and the request denied. The whites carried the city by 350 majority, about forty blacks voting with them, while it is said that but four whites voted the Radical ticket.

Ex-Senator Pomeroy seems to be just the man for one of the Morton Granger railroad commissioners, with power to negotiate the fixing of fares and freights and to stand between the people and the great moneyed corporations. On the 29th of July, his celebrated York case came up for trial. It will be recollected that eighteen months ago Old Subsidy, as Mr. Pomeroy is called by his friends, was a candidate for the United States Senate. While the contest was going on, he entrusted State Senator York with seven thousand dollars to be carried to a gentleman out of town who wished to establish a national bank. Mr. York, however, took the money into the convention and informed the presiding officer that Mr. Pomeroy had just given him seven thousand dollars as a bribe to induce him to work for Mr. Pomeroy's election. The truth of Mr. Pomeroy's narrative is what is at issue in the pending trial, but Mr. Pomeroy appears to be in little haste for this ordeal, and in fact is exhausting every device known to the human mind in order not to have any trial whatever, either now, at this present time, or at any remoter period. One of his latest moves is a threat that if "this thing" is not stopped somehow he shall tell what he knows about Kansas politicians. As these are the breed of Republicans who came into power on the last tide of the Ossawatomie, manhood-rights enthusiasm, and as they loved freedom so much that they were not required to have any character or any sense or any knowledge, it is altogether probable that there are among them numerous unctuous rascals for whom "Pom," which is another of his names, could make it very trying. He has made a beginning with the judge before whom his case was called. Yesterday week he offered an affidavit to the effect that as soon as the transaction between him and Mr. York in reference to the national bank got wind in the streets, this judge said to a friend, at the same time grasping him firmly by the hand, "Now we've got the — — old scoundrel where we want him." This was undoubtedly the popular sentiment in Topeka at the time; but the judge denies that he shared it, or so much as allowed himself to form an opinion.

The Postal-Car question has again come to the surface, Mr. Isaac Hinckley, President of the Philadelphia, Wilmington & Baltimore Railroad, announcing his intention to refuse to take the mails except at increased rates, and the Department threatening to get some other road to undertake the work if Mr. Hinckley persists, the ground of their refusal being that the existing law does not authorize any increase of rates. Matters have not yet shown any sign of proceeding to extremities, Mr. Hinckley being of opinion that a notice given by him of his refusal to go on except at higher rates will bind the Department in some way, should they persist in delivering the mails to his road for carriage. The railroads are in the right on the merits of the postal-car question, for there is no doubt that the introduction of the postal-car system, with all the expense of carrying additional cars, filled, not with freight, but mainly with civil servants of the Government travelling free, entitles the roads to much more compensation than they do actually receive. The manner in which Congress has dealt with the question is a curiosity in the way of legislation on a matter of such importance. In 1872, they passed an act increasing the compensation of roads maintaining postal-cars to an extent of fifty per cent.; they then adjourned without making any appropriation to meet the increased rates. In 1873, they repealed the act by passing another on a totally different principle, the result being very unsatisfactory to the roads, and about the same time referred the whole subject to the Senate Transportation Committee, which apparently has not yet found time to look at it.

We have received from a Germantown correspondent a letter in which he comments upon the *Herald* correspondent's recently published theory about the child Ross, kidnapped, as is supposed, some weeks since in Philadelphia. The theory was not dissimilar in its general character to those which often appear a little while after a crime has been committed, and when the police has had time to show that it is at a loss and baffled. On this occasion the theory was that the father of the boy procured his abduction, intending to work on the feelings of friends and relatives so far as to extort from them a large sum of money, ostensibly for purposes of ransom but really for business uses. One of the alleged fact upon which he based this view was, that at the time of t kidnapping the child's mother showed so little maternal feeling to be away for days enjoying herself at a watering-place. To t story, as thus composed, we last week made a reference in "T Week," affirming neither belief nor disbelief in it, but mention

it as one of the few things certain which had appeared on a subject so dark as to puzzle everybody. Our paragraph, however, might have been construed as bearing hard on the parents. We are glad to say that, from accounts given us, any such construction would be a great mistake and, we need not say, a cruel one. As regards the correspondent's "fact" of the watering-place visit, we are assured that the only foundation for it was that Mrs. Ross at the time of the abduction was lying so ill at the seaside that the bad news could not be broken to her, nor could she for some days be moved to her home. We are assured, too, from more than one source, that nobody acquainted with the character of Mr. Ross could entertain the least suspicion of his integrity in this matter. Altogether, this newspaper correspondent would seem to be a gentleman who needs at once the services of the provost-marshal of the *Herald* establishment.

Another week of the Brooklyn investigation has ended without bringing it to a termination, the point principally to be noted being that Mr. Beecher still delays his explanation of his letters. He and his advisers wait, it is said, for the testimony of Mr. F. D. Moulton to be given; they wish to see the whole of the accuser's case, and see what it is that they have to meet before they begin to meet it. But, as we have elsewhere pointed out, the procedure before a tribunal of this kind is not like the procedure before a court of law, and though an almost incredible deal of confusion, contradiction, manifest folly of speech, prevarication, and open falsehood have been thrown about the case at this as at every other stage, there is a general conviction that the delay is unfortunate for Mr. Beecher—and this because the tactics of the defence suggest rather the astuteness of an attorney in the confidence of Jay Gould than the open frankness of an accused and insulted man, whose accuser has fitted to one transaction letters which, as the accused should be eager to show and has publicly declared, are perfectly explicable as fitted to another and totally different transaction. This exculpatory explanation, as the public is inclined to think, it was possible to make at once, and best to make with all speed, without waiting to hear what might be said by Mr. Moulton or any one else, and without taking too much counsel of shifty lawyers. As things now look, the investigation is to result in no conclusive verdict. Mr. Tilton, for his last contribution to the disturbance, has sent a letter to the committee in which he expresses his respect for the individual members of it, but avows entire want of confidence in its powers and its impartiality as a body. He seems to threaten, though he does not actually do so, to take the matter into the courts; refuses to produce the originals of the letters on which he relies in his "statement"; says, however, that he once offered to read them to the committee, or to turn them over to Mr. Winslow, a member of it; charges malice and false reporting on certain persons unnamed; and, finally, makes known his intention to have no more to do with the Monroe-Street tribunal. A worse muddled affair, and one with more of the look of having been subjected to a deal of deliberate muddling, it would be hard to find. It has, moreover, from its beginning, been the dear concern of one of the most wonderful sets of scatterbrains, chatterers, and representatives generally of what we may call chromo-civilization, that any country in any time has had to show. The *dramatis personæ* make a list both amazing and sickening. But, happily, this will be the final end of many of them.

The French Assembly adjourns to-day till the 30th of November. This decision was reached on Friday, after a previous rejection of M. de Malleville's motion for a dissolution, by a vote of 374 nays to 332 yeas; and after a speech from Gambetta against the recess. A motion to raise the state of siege was also disposed of by the decisive negative of 366 to 282. The committee chosen to stand for the Assembly during the recess contains not a single Bonapartist; six Legitimists are united with ten from the Moderate Centre and Right Centre, and nine from the Left. A violent scene occurred in the Chamber on Sunday, when a Bonapartist delegate declared that the Republic had succumbed before the scorn of honest men. This brought him the lie from the veteran Republican Victor Schoelcher, and the usual tumult ensued, ending in the break-up of the session. One would have supposed that a brief allusion to the mode in which the Empire had succumbed would have been effectual as a retort; but the Assembly took to brandishing its canes, and the threats of duels and personal encounters were ardent and numerous.

The interest in Spanish affairs during the week has centred in the apparent effort of Germany to interfere effectively against a prolongation of the Carlist warfare. The immediate pretext for this action is the reported shooting of one or two German citizens by the Carlists, which leads the German Government to order a squadron into Spanish waters; and a similar motive, or a general understanding between the powers, has determined the sending of the British Mediterranean squadron from Malta to Barcelona, and an Italian frigate to the north coast. Spain and Germany together have called the French Government's attention to the open connivance of its southern provinces with the Carlists; and the wife of Don Carlos is said in consequence to have been obliged to quit Pau. Recognition of the Spanish Republic seems imminent. Austria is pronounced favorable to it, but France will bear more urging. A very gloomy view of the situation in Spain is taken by its ex-king, Amadeo, if an Italian interviewer is to be trusted. Party strife in that country, he said, failed to find a common object in the unity of the country. What frightened him off the throne was "the criminal disunion among the famous saviours of Spain," and the threat of a pronunciamiento with which the generals accompanied every decree and every discussion of their demands. Without foreign intervention, he believed Spain would in two years either become Carlist or be in the power of the Carlists, and intervention would only embitter the struggle.

But little headway has been made by the Brussels Congress, which was at last accounts still busied with preparing its programme. A majority of the members, it is said, are opposed to meddling at all with questions relating to naval warfare, preferring to confine their attention strictly to the mitigation of human suffering in war. This is not only a very proper conclusion if the formal assent of Great Britain to the results of the Congress is desired, as of course it is, but it is also a practical confession of the natural limitations of an international code at the present time. As an Italian journal well points out, the seventy articles proposed for the consideration of the Congress mostly embody regulations which have been already approved and adopted by civilized nations, so that there is really very little difference between the holding of certain abstract sentiments about humanity in war and the common application of them in actual hostilities. On the other hand, says the *Perseveranza*, it is to be feared that these humane considerations, when reduced to obligatory formulas, may tend to make war a still more costly sacrifice than it now is, by impairing the inventiveness whose object and effect is really to shorten war, by enabling combatants to concentrate the greatest possible force of every kind in the least possible time. The proposition, too, that the enemy occupying an invaded territory shall be regarded by the inhabitants as the *de facto* government, assuming at once its authority, functions, and resources, and demanding of right to be respected as was the displaced government, is both repugnant to the spirit of patriotism and impossible to put into execution. Moreover, it rests upon a singularly antiquated assumption, viz., that all wars are, and of necessity must be, purely political, and therefore extraneous to the respective peoples concerned. Nobody can deny that these are weighty objections, and it remains to be seen whether the world is any more ready for a Universal Alliance than it was for a Holy Alliance in the days of Madame Krüdener and the First Alexander.

THE NATIONAL SCHOOLING IN INFLATION.

IT becomes gradually evident that the final battle against inflation has not yet been fought. We would not have any one undervalue the veto of the President; on the contrary, we recognize the fact that it exercised in many ways a salutary effect. It rebuffed the political treachery of Congressmen elected by a party pledge to resumption, who, without any expression of a changed sentiment in the public mind, went over to inflation without even a decent pretext. It let loose for the moment the tongue of the quiet and moral part of the community, and showed that there is a much wider and stronger feeling in favor of maintaining the financial faith of the Government than had been supposed. It also gave to the business intelligence of the people a breathing time in which to recover from the unexpected ambuscade of Congress, and to look about for men in whom they can really trust. Finally, it called out, at home and abroad, some very clear and strong expressions of condemnation of the action of Congress, and illustrations of the disastrous effects of the inflation scheme, which must have done a great deal to instruct a large variety of persons who had not taken the trouble to think much upon the subject.

Nevertheless, there are in this country, as in every other, a great number of people who are not prepared to be convinced against their will. Their will, moreover, depends upon their interests, real or supposed, and they prefer a temporary personal interest to a permanent general one. The number of persons in a community ready to borrow is always larger than the number ready to lend. In this country, the proportion of persons wishing to borrow money far exceeds that of any other country in the world—not because we have a larger proportion of Jeremy Diddlers here, but because we have an immense number of persons of an ingenious, speculative, and energetic turn of mind teeming with schemes for the rapid acquirement of wealth, and also an immense number of persons possessed of encumbered or unproductive property, who find themselves in a cramped or embarrassed financial condition; and, again, a considerable horde of State, county, and city officials, directly or indirectly interested in public loans, and eager "at this particular time" to have money made easy. In the West and South these persons abound, and the West and South also are rich in "undeveloped resources." Hence, the West and South are borrowers, and never more importunate borrowers than at the present time. The term "debtor class" we have heretofore shown to be fallacious; but there is such a thing as a borrowing class, and in no country is the borrowing class so large or so active as in this. The persons who compose this class in this country are also just the persons who would naturally have a hand in our abused and degraded system of politics. In numerical strength they do not compare with the industrial, producing, and accumulating classes, but they nevertheless possess a certain political momentum, which when it strikes the small politician in or out of Congress drives him a great way out of his prescribed course. Inflation, to their minds, is an ingenious, roundabout way for the Government to borrow money at an enormous sacrifice and lend it to them without interest. More strictly speaking, they design that every other man's honestly-acquired dollar shall be clipped, in the expectation that they will come into possession of some of the clippings. A philosopher, studying the peculiar social conditions of the West and South—the restless, unscrupulous, speculative elements of the one; the ignorant, demoralized, impoverished elements of the other—coupled with the debased character of our political machinery, might have predicted the precise condition of affairs that now exists.

Furthermore, the financial history of the last thirteen years shows that we have been unconsciously educating, as it were, the uneducated mind of the country to believe in inflation. The issuance of paper money was in effect nothing more than an unlimited method of borrowing at a more ruinous rate of interest than any government ever before paid for a loan. It is always easier to borrow than to pay, and a spendthrift when he has effected a loan always considers himself richer and not poorer, and regards the times as good. The ordinary observer saw that paper money was borrowing made easy, but did not see the enormous "shave" which the Government paid for the loan. He also soon discovered, if his farm was mortgaged, that he could sell a dollar's worth of grain for two nominal dollars, and then pay off his mortgage at precisely fifty cents on the dollar. In hard-money times he was in debt, but when paper money had sent gold up to 200 he got out of debt. Therefore inflation was a very good thing for him. The singular and significant fact in connection with it was that the lenders throughout the country acquiesced in this way of paying debts, and taught borrowers that inflation was a method whereby half of a debt could be made to discharge the whole. The easy, good-natured proclivity of the American mind in such circumstances is to take what it can get and avoid litigation; and there was then a fervent patriotic sentiment in the community, which prompted men to uphold the Government by taking its paper as money, and attaching to this paper a value and a character which very few men believed at heart that it really possessed. If there had been generally the tenacious "standing up for one's rights" that so arbitrary a measure when applied retroactively would have invoked in ordinary times; if men had sturdily maintained that the legal-tender act could not do away with existing obligations, and that Congress had no power to confiscate a part of their property and pay it away as a part of the discount for a national loan, we may be sure that the first legal-tender decision would have been well-nigh unanimous, and that the second would never have come against the decided moral sense of the community. But the troubled era of the rebellion was no time for "standing up for one's rights," and nearly all men preferred that values should be temporarily unsettled, and individual losses sustained, rather than that the slightest additional embarrassment should be cast upon the Government. Nevertheless, the financial instruction of the hour was, that through the medium of Government paper fifty cents could be made to pay off a dollar's indebtedness.

So long as there was what might be termed a falling paper market—*i.e.*, so long as gold kept rising—this process for paying debts grew easier and easier. It was easier to pay seventy-five cents on the dollar than one hundred; it was easier to pay fifty than seventy-five; it was still easier to pay forty. If Government paper had gone on becoming plenteous and cheap until it reached the cheapness of Confederate "graybacks," paying one's debts would have been a trivial amusement instead of what it always had been, the chief concern and burden of a business life. But when the long lane turned, and paper began to rise in the market and approximate to the value of gold, then the old-time difficulties of borrowing and paying began to return. As fresh dilutions of paper during the war had made paying an easy task, it was natural for men after the war to infer that fresh dilutions would make it easy again. The nation, too—that is to say, the community as a whole—had stopped its easy-going course of borrowing and spending, and was engaged in the disagreeable, grinding task of retrenching and paying. Of course, this operation could not go on without affecting more or less everybody in the community, and necessarily affecting them disagreeably. Of course, such a period was just the time for the political demagogue to come upon the stage, and inform everybody that through the ingenious invention of paper-money we could go on *ad infinitum* borrowing and never paying. The story of the man who gave his note and then thanked heaven that that debt was paid, our Butlers and Mortons have been repeating in sober earnest, assuring people that it is only necessary that the notes be given by the community collectively, and not by its individual members, and then the debts will be paid, and we can continue to give as many more notes as we please. It may be doubted whether there is anybody who really does believe this nonsense, but the course pursued by our business community from the first has been such that every national borrowing has redounded to the immediate advantage of every individual borrower, and there are men enough who perceive that and are ready enough to seize upon any such temporary advantage.

Now, what has been the course pursued by the business community—that is, by the men who have had money to lend or credits to give? With the floods of Government paper during the war, money was plentiful—that is, paper was cheap; and the ease with which it was acquired made men careless as to the manner in which they invested it. Accordingly, the West, which is always a borrower, was not slow to perceive that loans could be readily procured to carry on its speculative enterprises. It was also clearly enough perceived that fresh dilutions would make it all the easier to repay the nominal amount borrowed. So far as the hand-to-hand transactions of daily life were involved, the fluctuations of paper were comparatively unimportant; but when it came to "time transactions," where the rise or fall of paper might exceed all reasonable calculation, business probity required that the real value of the thing loaned should be definitely settled and mutually understood. Instead of this, the lender as a rule speculated upon the chances of paper approximating to gold before the debt should mature, and the borrower speculated upon the chances, first, that he would make a great deal of money out of his venture, and, second, that if he did not, inflation would come along and tide him over the bar of payment. He was thus educated to be an inflationist, and a hundred other men looking on at the same time were taught the same lesson.

It is also a noticeable fact that what gold-bearing obligations there are in the community singularly lead to the same result. The gold-paying debtors here are the Government and a few corporations. Any ordinary man holding $10,000 of such securities cannot help hoping in his inmost soul that when his coupons become payable, gold will happen to be up. His baker's and butcher's and grocer's bills do not fluctuate with the price of gold, and sometimes when his gold coupons have brought him the fewest greenbacks he finds that beef and coffee are higher than they were before. Thus we have insensibly arranged everything so as to make ourselves inflationists against the conscious dictates of our common-sense. It is preached with vigor that our future prosperity requires that we should retrench, and stop borrowing, and redeem our national promises to pay; but practically it is added, for the benefit of enterprising borrowers, that they may vote themselves loans if they choose, and may again vote how little they will pay upon them when they become due.

ONE OF THE INDIAN OUTBREAKS.

THERE are at this time two sets of serious Indian disturbances in the West, each of which may develop into a formidable war. One centres in the expedition that General Custer is leading into the Black Hills; the other extends over the region watered by the tributaries of the Arkansas and Red Rivers. It is with the latter that we are now particularly concerned.

The Indian country lying east of the Rocky Mountains and south of the Platte River was formerly, in a general way, under the control of the Arapahoes, Cheyennes, Kiowas, and Comanches. Inheritance or force had given those plains into their possession, and they held them against all comers, until they were forced upon reservations where they are detained by treaties, generally signed under the yoke, whose observance, on their part, is secured by the pressure of military propinquity. There are none of them grown to manhood who do not recall to mind the time when they could move without hindrance, save as they feared their savage fellow-rovers, over the whole expanse between the Rio Grande and the Missouri. To be confined to reservations, however spacious we may consider them, is galling to men whose former life was as uncontrolled as that of the beasts of the chase; and it is not to be supposed that they acquiesced in this arrangement from a sense of justice, or that they love the new régime presided over by their conquerors. A few of the elders who have acquired all the fame that the war-path can give, and who now, by the accumulation of ponies, are gaining that sort of power that wealth always bestows, may counsel peace; but the very reputation that gives weight to their advice is also an incentive to ambitious warriors to emulate their prowess. Such, for instance, is Little Raven of the Arapahoes. He is a conservative whose influence for some years has been for peace with the whites. But he possesses the influence because of his record as a warrior and of his present pastoral possessions. Ambition, therefore, is a constant spur to the younger men, and they chafe under restraint.

To the mass of the reserve Indians, subsistence without labor and the fear of punishment must be for many years the effective restraining influence. That they are susceptible of elevation, chiefly through their youth, the history of the Choctaws, Cherokees, Creeks, and Seminoles abundantly shows; but the active men of the lately roving tribes cannot be transformed at once, if ever, into tillers of the soil nor into herdsmen. The reward that steady industry offers has no charm for them. They have no present desire for such a life, and they will only see its advantages, if at all, after long years of careful training. On the other hand, they are savages, and they delight in the pleasures of savages. Civilized men admit the fascination that belongs to war and the chase—kindred pursuits; to savages they are the *summa bona* of existence. But beyond war for its own sake, revenge, which to the uncivilized man comprehends and is synonymous with both justice and honor, constantly appeals for gratification. Christianity and law are gradually introducing among some of us a different standard of action, but "an eye for an eye" is the demand that simple self-preservation insists upon. Wherever Christianity is not in force, vengeance or punishment, under what guise we choose, must be admitted or there is a direct invitation to extermination. Revenge is not dishonorable with the savage any more than it was with the ancients, nor should it be so regarded in the absence of Christian teaching. It is an application of justice that he directly appreciates and is swift to employ. As the superior, we should be slow to provoke him, and be prompt to inflict condign punishment when deserved; for the average savage looks upon forgiveness without a penalty as cowardice. Added to these considerations, we have the principle that successful robbery from an alien is meritorious; exactly as our ancestry of the North Sea, the marches of Scotland, and the heights of the Rhine believed and practised.

These fundamental facts must always be borne in mind when discussing the Indian question. They create a persistent and powerful *vis a tergo* impelling the Indian to what we call lawlessness. Upon our part we should guard against the outbreak by the most scrupulous justice in removing all excuse or temptation, and by the constant exhibition of power to inspire respect. When this is done, the active moral agencies may be employed with happy results. But, as among the poor of our cities, good works must sustain the suffering before good words will be heeded. Unfortunately the experience of these tribes is no exception to the general rule that has characterized our Indian policy. A single example from those stamped upon their memories will illustrate the degree of affectionate regard in which they may hold us.

In 1864, a very large number of friendly Cheyennes came in to the neighborhood of Fort Lyon by the invitation of the proper authorities, and were subsisted by them for some time with the ostensible purpose of distinguishing them from hostile Indians, and of affording them the protection of the United States flag. After several months a large number of their able-bodied men were sent out for buffalo, and in their absence Colonel Chivington, of the Colorado Volunteers, who was perfectly aware of the relation which these people sustained to the Government, with about a thousand cavalry suddenly attacked the village, two-thirds of whose population were women and children, destroyed it and massacred the community. They were slaughtered without regard to age or sex. He reported, "It may, perhaps, be unnecessary for me to state that I captured no prisoners. Between five and six hundred Indians were left dead upon the field." More than this, their bodies were mutilated with shocking barbarity. Comment cannot magnify the horror. This man has never been punished, because the crime was regarded as a "military" offence, and his term of service having expired shortly afterward he was considered beyond jurisdiction. And to

this day numerous frontiersmen are to be found, men of influence as well as of the baser sort, who hold Chivington's treachery as an exploit to be emulated. This is, unfortunately, only a natural outgrowth of the sentiments held by many of the settlers on the border. They look upon the Indians as absolutely without rights, and they are only restrained by the fear of retaliation from acting upon this theory. As a consequence, many of the outrages upon the red men never appear in print, or, if they do, they are held up for imitation; while the atrocities of which white men are the victims are dwelt upon and magnified. Border public opinion, therefore, is generally in a receptive state when anything to the disadvantage of the lower race is concerned.

And, indeed, when we abandon justice, and especially charity, there is very little that draws us to the Indians. They are savages; and that means half-clad wretches who are dirty, lazy, repulsive beggars, who will steal on slight provocation, who have few virtues and many vices, and who are fearful as enemies. When at war they are diabolical. And yet they are not really devils, but are simply a low grade of heathen men. It is obvious, therefore, that for their own protection, as well as for that of the whites, they must be limited to certain bounds, and that these must be kept inviolate and the treaty obligations be strictly observed. But as the reservations are generally well selected, they excite the cupidity of some and the jealousy of others, who are not slow to make such encroachments as a lax civil power winks at. Whiskey-traders will enter them, or will skirt their borders, dealing out a poison whose immediate effect upon the Indian is to make him a furious maniac. Temporary squatters cut timber or trap, if they think they have any chance of escape. Horse-thieves infest them in gangs, alternately provoking the Indians to anger and tempting them to crime. It is difficult merely to outline their various wrongs. One of the old and just Indian grievances, one of their excuses for their early assaults upon travellers on the Santa Fé trail and the Platte route, was the unnecessary killing of buffalo. The protection of the buffalo and the utilization of the entire carcass when slain is a strong point in their character, and its wanton destruction excites great indignation. With the spread of settlements the grazing limits have yearly grown less, and now that railroads penetrate the heart of the range very many thousands of these animals are annually slaughtered, both in and out of season, with no intention or possibility on the hunters' part of taking a tenth part of each. Some shoot them for their tongues, some for their hides (not for robes, but as a heavy leather). Some actually cut the shaggy hair to mix fraudulently with coarse Mexican wool; some ship the hind-quarters East for food. In certain localities the dead may be seen as thick as horses on a battle-field, polluting the pure air with a horrible stench. It is understood that in the last treaty with the tribes before mentioned, it was provided that buffalo should not be hunted by the whites in the country south of the Arkansas. If this article exists (and they believe that it does), the whites no more regard it than do the buffaloes themselves respect the parallels of latitude. The hunters are ubiquitous, and the herds are fast being destroyed. Indeed, systematic extermination of this animal is seriously advocated by many as the speediest solution of the Indian problem, on the ground that when they are gone the Indians must starve or become perfectly docile. Meanwhile this flagrant violation of their treaty rights excites their bitter anger, and last year they sent direct messages that if their cattle (the buffalo) were thus hunted they would compensate themselves among the white men's herds, which are now so extensive and valuable on the upper Arkansas.

The matter of treaty-making is another of the difficult features of the problem. The tribal organization approaches a pure democracy. The authority of the chiefs is mainly one of influence. Any man who has the ability may lead a band, and it will increase or lessen with his varying fortunes. And as individuals adhere or recede at pleasure, it results that they will, in a great degree, follow their inclination in more grave matters. We have an illustration at this time in the very tribes that are our theme. The latest advices say that some of their young men are on the war-path, but that the principal chiefs are peaceful. But if one or more of these bands are successful the tide may swell until it sweeps away the tribe. To control these younger men is of the utmost importance and of the utmost difficulty. During the six years that have passed since they have been at war as a community, a large number of youths have grown fit for the field. Their entire education, moral and physical, has taught them to revere the successful warrior; and when these warriors counsel peace, they strip off their own decorations and their only titles to respect. Ignorant of the vast power of the country, they measure it by the few troops or the occasional herdsman that they see, and boldly enter the only road to pelf and place that is open. When their chiefs come back from Washington, the witchery that they seem to have undergone is explained by the "bad medicine" of the whites, and they are perfectly sceptical of the strength of a nation whose warriors, scattered in little bands, they can count upon their fingers. And they are the more ready to infringe a treaty from feeling that day by day it is violated by the other party.

But, after all, it is perhaps not too much to say that notwithstanding the predatory instincts of the younger men, many of the general Indian wars are directly incited by designing white men. The concentration of troops and the purchase and transportation of supplies involve the expenditure of so much money that it is often a matter of great financial importance to the community in which it can be made to occur. It is difficult, perhaps impossible, positively to prove such crimes, and to connect together cause and effect, but unprejudiced observers often believe it true. It is beyond doubt that highly exaggerated and often purely fictitious reports of outrages are transmitted with sinister design, while, as before remarked, the other side of the picture is kept veiled. We are not attempting to conceal the wrongs which the Indians commit. They sin as well as are sinned against. To appropriate personal property, especially when a degree of glory attaches to the act, to raid into Texas, which from the earliest Spanish times appears to have been looked upon as a legitimate field for forage, are constant temptations to which they often yield. And when they once fairly go to war, they are such frightful barbarians, they commit such fiendish outrages—outrages that cannot be decently spoken of—upon men and women and children, that the heart becomes steeled, and nothing short of extermination seems endurable. It is then that every one who has personal knowledge of their deviltries agrees to the *mot* that "the good Indians are dead Indians," and it is because they have thus suffered in their families or in their ancestry that we often find such implacable hatred towards them in men otherwise of good repute.

If the sparks of war that already exist are fanned into a flame, it will burn over a region about equal in extent to the four Middle States. To guard this tract, and to drive the enemy to and keep them on their reservation, there are about two thousand soldiers, of whom perhaps fifteen hundred (one-half being mounted) are available for active operations. The guerilla tactics of the savage practically neutralize many times their own numbers. We have referred only to those tribes south of the Arkansas, and have taken no account of the fierce and numerous Sioux of the North. But besides the Cheyennes and Arapahoes in the Indian Territory, there are considerable detachments from each of these in Wyoming living in close relations with the Sioux, but in frequent communication with their Southern kinsmen. It is not impossible that these may be the links to unite both groups of Indians in a general war, should decided hostilities occur at either end of the chain.

EVIDENCE ABOUT CHARACTER.

THERE has been during the week a loud and increasing demand for the application of the legal process of discovering truth to the Tilton-Beecher case. People ask that it be carried into court, not only because all witnesses might thus be compelled to appear and testify, but because appa-

rently there is, in the minds of many, a peculiar virtue in "the rules of evidence" used by lawyers. Witnesses examined under these rules are supposed to receive from them a strong stimulus to veracity and explicitness, while they at once expose prevarication or concealment. One newspaper eulogist went so far the other day as to pronounce the rules the product of the wisdom of all ages, beginning with the Phœnicians and coming down to our own time. There is, however, only one good reason that we know of for carrying the Beecher case or any similar case into court, and that is the obvious one, that the courts only can compel those who are supposed to know anything about a matter in litigation to appear and state it. If the case were transferred to the City Hall, therefore, we should undoubtedy have a far finer treat, from the prurient and sensational point of view, than we are likely to get from the Brooklyn committee or any other extra-judicial body. All the scandal-mongers—both the effusive, fussy kind, who now furnish hints and nods and winks of "confessions" and "statements" to the reporters; and the sly kind, who retire to their "country seats" and keep dark—would, if they could be caught within the State, be furnished with an opportunity of producing in a conspicuous way a great deal of dirty gossip. But we do not know of any other advantage which can be claimed for a trial in court, in a case like that now pending, over a trial before a well-selected lay tribunal. We had reason to point out once before, under somewhat similar circumstances, that "the rules of evidence" in use in our courts are not, as too many persons seem to suppose, deductions from the constitution of the human mind, or, in other words, natural rules for the discovery of truth under all conditions. On the contrary, they are a system of artificial presumptions created for the use of a tribunal of a somewhat low order of intelligence, and are intended to produce certain well-defined and limited results, which the law considers generally beneficial. They have, that is to say, grown up for the use of the jury. The large number of exclusions which they contain are due simply to a desire to prevent the jury's being confused by kinds of testimony which they are not supposed to have learning or acumen enough to weigh. If any one will go into the City Hall and listen to the trial of even a trifling cause, he will find that the proceedings consist largely in the attempts of one lawyer to have certain facts laid before the jury and the attempts of the other to prevent it, the judge sitting as arbiter between them and applying the rules of admission and exclusion to each of these facts as it comes up. If he examines, too, in each instance what it is that is thus pertinaciously offered and pertinaciously opposed, he will find that it almost invariably has *something* to do with the controversy before the court—it may be near or more remote—but still something. Consequently it has, logically, a certain bearing on the case, or is, under the constitution of the human mind, proper evidence. When the judge says it is irrelevant, he does not mean that it is logically irrelevant; he means simply that it has been declared irrelevant on certain grounds of expediency by the system of jurisprudence which he administers. He refuses to let it go to the jury because he thinks it would befog them or turn their attention away from the "legal issue," or, in other words, from the one little point on which the law compels the plaintiff and defendant to concentrate their dispute, in order to render it triable at all by the peculiar tribunal which the Anglo-Saxon race has chosen for the protection of its rights.

It follows that our rules of evidence are unknown on the European continent and in every country in which courts are composed of judges only—that is, of men with special training and capacity for the work of weighing testimony—or in which the legal customs have been created by such courts. There the litigants follow the natural order, and carry with them before the bench everything that has any relation to the case whatever, and leave the court to examine it and allow it its proper force. Our own changes in the law of evidence are all in this direction. The amount of excluded testimony—that is, of testimony which we are afraid to trust the jury with—has been greatly diminished during the last few years, and, considering the growth of popular intelligence, properly diminished. The tendency of legislation now is towards letting the jury hear everybody—the plaintiff and defendant, the prisoner, the wife, the husband, and the witness with a pecuniary interest in the result of the trial—and put its own estimate on what the testimony amounts to. But nevertheless, even now, who is there that has ever watched the preparation of a cause for trial who has not listened to lamentations over the difficulty or impossibility of getting this or that important fact before the jury? or has not witnessed elaborate precautions, on one side or another, to prevent some fact from getting before the jury? The skill of a counsel in examining or cross-examining a witness, for instance, is shown almost as much by what he avoids bringing out as by what he brings out, and no witness is allowed to volunteer any statement, lest he should tell something which, however pertinent in reality, the rules pronounce inadmissible.

Now, rules of this kind are singularly unsuited to the conduct of enquiries touching character. It is true the law provides a process nominally for the vindication of character, called an action for libel, but the remedy it supplies is not a vindication properly so called, but a sum of money as a kind of penalty on the libeller, not for having assailed you, but for not having been able to prove his case under the rules of evidence. In a suit for libel, too, the parties fight their battle in the strict legal order—the plaintiff, that is to say, stands by and challenges the defendant to produce his proofs, and then fights bitterly through his counsel to keep as much of the proof out as he can. He supplies no evidence himself that is not strictly called for, and proffers no explanation that does not seem necessary to procure an award of pecuniary damages, and takes all the pains possible to bring confusing influences to bear on the jury. When we consider, too, that the jury is composed of men who may be said to be literally called in from the street, without the slightest regard to their special qualifications for the conduct of any enquiry, and that they are apt to represent popular passions and prejudices in all conspicuous and exciting cases, we easily see why a trial by a jury, under the common-law rules of evidence, is not the process through which a high-minded man, who sought not for "damages," but to keep his reputation absolutely spotless in the estimation of his neighbors, would naturally seek his vindication.

It cannot be too often said, in these times when great reputations are so often assailed and so often perish, that nobody who has not deliberately chosen the life of a stoical recluse is justified either in refusing to defend his reputation, or in defending it by technical processes if any others are within his reach. It is, of course, open to any man to say that he cares nothing for the opinion of mankind, and will not take the trouble to influence it in any manner in regard to himself. But, if he says so, he is bound not to identify with himself, in any manner, either great interests or great causes. If he makes himself the champion of other people's rights, or the exponent of important principles, or has through any power of his achieved an influence over other people's minds sufficiently great to make it appear that certain doctrines or ideas must stand or fall by him, he has surrendered his freedom in all that regards the maintenance of his fame. It is no longer his only to maintain. It has become, as it were, embodied in popular morality, been made the basis of popular hopes, and a test under which popular faith or approval is bestowed on a great variety of ways and means of living. Such a man is bound to defend himself from the instant at which he finds the assaults on him begin to tell on the public conception of his character. Dignified reserve is a luxury in which it is not permitted to him to indulge; and when he comes to defend himself, it must not be with the calculating shrewdness of the strategist or tactician. The only rules of evidence of which he can claim the benefit are the laws of the human mind. The tribunal, too, before which he seeks reparation should be not what the state supplies only, but the very best he can reach, and it should, if possible, be composed of men with no motive for saving him and with no reason for hating him, and with such training and experience as may best fit them for the task of weighing his enemy's charges and his own excuses and explanations. His course before such a tribunal, too, should be marked by ardor rather than by prudence. He should chafe under delay, clamor for investigation and invite scrutiny, and put away from him all advisers whose experience is likely to incline them to chicane or make them satisfied with a technical victory. Such men are always dangerous in delicate cases. He should not wait for his accuser to get in all his case if the substantial part of it is already before the court; because his answer ought not, as in a court of law, to cover the complaint simply and no more. It ought to contain a plain, unvarnished tale of the whole transaction, and not those parts only which the accusation may have touched, because his object is not only to wrest a verdict of "not proven" from his judges, but to satisfy even the timid and sensitive souls whose faith in their idols is so large a part of their moral life, not only that he is not guilty, but that he never even inclined towards guilt.

THE COMTE DE PARIS'S HISTORY OF THE REBELLION.

PARIS, July 17.

WHEN the Comte de Paris was still in exile, he inhabited a house at Twickenham called York House, which is one of the simplest of the cluster of mansions on the banks of the Thames. I spent many hours in his library, which was full of modern books, and I noticed that an immense space had been allotted to all the documents on America—maps, official reports, surveys, etc. Any book which appeared on America (I do not speak of that *America vetustissima* which is only cultivated by bibliophilists, but of modern America) was sure to find its way to the shelves of this library, and, what is more, to obtain a good binding. The Comte de

Paris, who had much leisure and who is naturally of a serious and laborious disposition, had undertaken a great work. He had been a soldier in the army of the North, and had played a very creditable part in the unfortunate campaign of the Virginian Peninsula. He had followed day after day from Europe, after his return to England, the movement of the armies in which he had left many friends, and which had been organized under his eyes. He received from all sides very valuable documents, sometimes original notes and letters; he resolved to write a comprehensive history of the Civil War in America. The task was truly difficult; and I shall astonish many of your readers if I tell them that the Comte de Paris now thinks that his work cannot be well completed if he does not write nine volumes in octavo; he had hoped at first to be able to do it in seven volumes.

Modern wars cannot be written like the campaigns of the ancients. Think of how much Cæsar has condensed in that immortal volume of 'Commentaries,' which occupies so little place in the library; and Cæsar even finds the time to report the speeches which he makes to the Gallic chieftains, and their answers. But you must reflect that, after all, there was so much difference between the legions of Cæsar and the unruly armies of the Gauls, that the result was a mere question of time and patience. Cæsar wrote for the Romans, and the Romans cared little for the history of the factions of the Gauls; it was enough for them to know th t their armies were triumphant, that their legions moved freely over large territories, over unknown rivers and mountains, to the shores of unknown seas. The world has somewhat contracted since, though new continents have been discovered. We know something of every part of the world: *humani nil a me alienum puto*. We are also more analytical; the cultivation of science has become so general that we are no longer satisfied with history when it is not somewhat scientific—that is to say, when it does not show us the reasons and the development of events. We do not sit down before history as we should before a drama; we step on the stage, go behind the curtain, see the rehearsal, talk to the actors. Take, for instance, the 'History of the Crimean War' by Kinglake, and see how much space is assigned to the history of the causes of the war, to the minute analysis of the character of his principal personages. The battle of the Alma might be told in half a page; it occupies a whole chapter.

If I am not mistaken, history can only be made concise when its elements are already perfectly known. Hundreds of volumes have been written, for instance, on the campaigns of the First Napoleon; each of these volumes, let us suppose, brought out some new fact, some new document. New information cannot be conveyed in a short space, it must be exact, it must be complete, and therefore it cannot be abridged. The pioneers of history, if I may use the word, cannot well spare their work; it is only when by their efforts the truth is perfectly known, when all doubts are removed, that some great historian can come and separate from the collected information what is most important and write some concise work, which becomes classical.

There are very few, on the whole, of such classical histories; we must not speak of the ancients, as in their case we are too happy to preserve anything which has been respected by time; but can Voltaire's 'History of the Age of Louis XIV.' be considered as the *dernier mot* of the history of that age? Hardly so; a very remarkable work it is, but far from perfect. Macaulay's 'History of England' approaches perfection in some parts, in others it is very feeble. I am convinced that the historical works of M. Thiers will be completely neglected in a few years, especially the part in which M. Thiers probably takes the most pride—I mean the account of Napoleon's campaigns. There is more to be learned in a few pages of Jomini than in all M. Thiers's fantastic descriptions of battles.

The Comte de Paris has attempted to give a complete picture of the United States during the war of secession, but from the first two volumes of his work which have just appeared, and which have been very favorably received, it is evident that the history of the military events will have the principal place in this elaborate picture. The first volume opens with a very complete history of the American army. It is certainly one of the most singular anomalies that the American people, being essentially pacific, should have the best military school in the world, or one which can compete successfully with the best, such as the Polytechnic at Paris. It was a happy idea, in the circumstances in which America was placed, to make, so to speak, an army of good officers, to form the *cadre* without filling it. The *regulars* of West Point receive at first the most complete scientific education which can be given; I have myself examined the programmes and the text-books at West Point, and it seems to me that they leave nothing to be desired. The practical difficulties with which the officers have immediately to contend as soon as they leave the military school, the responsibility which is often thrown on them, the extraordinary life which many have to lead, all tend to give them new qualities, and to form a body of men skilled in every one of the sciences which constitute the art of war. This was well seen in your Mexican war, which was, speaking purely from the military point of view, a sort of miracle of daring, of sagacity, of skill. Can anything be more wonderful than the campaign of a small army which never numbered 14,000 men, and which was able to go from Vera Cruz to Mexico?

The Comte de Paris tells in a most graphic manner the history of this Mexican war, and makes his readers familiar with the names which were to become so famous during the war of secession. General Scott was the first master of Lee, of McClellan, of Beauregard, of Sumner, of Kearney, of many others. If the Mexican war was the brilliant period of the history of the small American army organized in 1815, the army continued always to improve, owing to its incessant wars against the Indians, especially against the Seminoles. The reports of the officers published by the Ministry of War will form, some say, the best archives of the colonization of a great part of the continent, and will become as precious as the voyages of the first Jesuits in Canada or in the Valley of the Mississippi. In the deserts and solitudes of America a new type of officer was formed—the soldier became a geographer, a geologist, a botanist, and an astronomer. All the powers of observation found their exercise. In my contact with the old West Pointers during the great civil war, I was always struck by their peculiar manner, very different from that of our European officers; they seemed more like civilians, like men I would not say of the world, but men of business, caring very little for outward effect, for the trumpery of uniform, and very attentive to the realities which constitute the welfare and the security of an army. America owes much to this phalanx, which was almost unknown and by many despised before the hour of danger came. When the war came to its end, it was found that all the heaven-born generals were gone, and that hardly anything remained in the staff of the armies but these men who had at first been swept aside by the tide of civilians, of politicians, of enthusiasts. They had, merely because they were the most capable, been chosen one by one as the leaders; they had organized, reorganized, made order out of chaos, and victory out of defeat. Let America always preserve her military school and her typical little army, her scientific army, which in an emergency can make generals of its colonels, colonels of its captains, and, I may almost add, captains of its soldiers.

Coming to the causes of the war, the Comte de Paris does not hesitate to say that slavery was the only cause of hostility between the North and South: "There was no real difference of origin between them. All those which the South invoked when she despaired of obliging Europe to help her, and wished to move its sympathies, were purely imaginary. She resorted to fanciful genealogies when, showing France its ancient colony of New Orleans, she said that it was half-French, and when, turning to the side of the English aristocracy, she evoked the memory of the Cavaliers exiled by Cromwell, and opposed them to the Yankees, whom she attempted to represent as a congregation of Germans and Irish. In reality, the Anglo-Saxon race was dominant in the South and the North. It was absorbing rapidly those which had preceded it, and which still furnished many immigrants. . . . No commercial interest separated the South from the rest of the States. Great rivers united all the centre of the continent in one great basin, and all the products converged in the principal artery of the Mississippi, the key of which was in the hands of the Southern States. These States, absorbed in the cultivation of cotton and of the sugar-cane, bought from the West the meat and the cereals which they did not produce in sufficient quantity." I still remember articles published by M. Michel Chevalier in the *Journal des Débats* and in the *Revue des Deux Mondes*, in which this celebrated economist attempted to prove that the war was in reality one between free-trade and protection. I had some difficulty at the time in convincing the able editor of the *Revue des Deux Mondes* that this was a wrong view of the portentous events which were taking place in America. I was constantly met with the famous argument, which was also urged by Mr. Gladstone, by the Duke of Argyll, and by many English liberals: "But why does not the Northern Government make a crusade against slavery?" They did not see that the aggression had not come from the North, but from the South; that the North was fighting for the Constitution, and in consequence was trammelled by the Constitution itself. The progress of events, however, soon showed to the world that the North could not conquer the South without striking at the institution of slavery. All the readers of the Comte de Paris's work will find a very luminous and just exposition of the difficulties of the North. The writer shows very candidly his sympathies for the liberal cause; and such is the passion for wrong which lingers at all times in some minds, that this part of his work has already been attacked with some bitterness by those who cannot even now be consoled for the defeat of the cause of slavery.

The Comte de Paris was so closely concerned on the staff of McClellan

with the organization of the first armies of the North, that much interest must be attached, in a military point of view, to his narration of these early efforts, to his account of the battle of Bull Run, to his description of the war material, of the commissariat system. His second volume is filled with the story of the events which preceded the capitulation and recapture of Lexington, Mo., with the account of the battle of Ball's Bluff, of the first naval battles, of the capture of the Confederate Commissioners. Then we come to Donelson and Pea Ridge, to Shiloh, to Roanoke, to Hampton Roads. This second volume is almost exclusively military. It ends with the defeat of Jackson and the disembarkment of McClellan at Fort Monroe. The author naturally tries to excuse many of the faults of McClellan on the ground of mistakes committed by the War Department at Washington. His last pages are a sort of preface to the bloody expedition of the Peninsula. We must leave him here, and thank him for the clear and complete exposition of the events of the beginning of the war. What astonished most the Doge of Venice in Versailles was to see himself there. We might say likewise that what pleases us most in this book is to see it written by one of the momentary actors of the war, who could best afford to be quietly contented with the triumphs of the cause which he had gallantly espoused.

Notes.

THE bibliography of cremation as a mode of interment, and of related subjects, is given in Bulletin No. 30 of the Boston Public Library. When the works mentioned are not to be found in that library, it is so stated; the Astor Library being most frequently referred to.——A German version, by Edward Leyh, of Joaquin Miller's "Arizonian," the first and the best of his 'Songs of the Sierras,' has appeared in Baltimore (Fischer & Rossmässler) in paper covers.——Dr. David P. Holton, M.D., 19 Great Jones Street, is preparing a work to be called 'Reminiscences of the Fifteenth Ward of the City of New York,' for which he solicits material from all persons who were living there some forty years ago. Dr. Holton came to the city in 1834, and a portion of his reminiscences has already been given in an autobiographical sketch read in May before the N. Y. Genealogical and Biographical Society.——Stechert & Wolff, No. 2 Bond Street, will be the agents for this country of the long-awaited *Deutsche Revue*, which is designed to be a Teutonic *Revue des Deux Mondes*. It will, however, be published monthly instead of fortnightly, the first number appearing in October. The subscription price is $8 80 gold.——No. 7 of Trübner's 'Catalogue of Choice, Rare, and Curious Books' offers for the trifling sum of £300 a fine collection of caricatures relating to the Franco-Prussian war (1870 to the end of 1872), in 9 vols. folio, the ninth being composed of Rochefort's *Lanterne* and *Mot d'Ordre*, Pyat's *Vengeur*, and other Communistic and pre-Communistic sheets; a collection of the judgments of the European press on Napoleon III. in 1873, with illustrations, in 3 vols. folio; and English caricatures of Napoleon III., from 1848 to 1872, in 3 vols. 4to. On another page of the catalogue are advertised several very old cook-books, one in MS., which ought to throw some light on the origin of plum-pudding.——J. R. Osgood & Co. have republished, in book-form, the excellent and now timely articles contributed by Gen. Francis A. Walker to the *North American* for April, 1873 ("The Indian Question"), and the *International Review* for May, 1874 ("Indian Citizenship"); together with an extract from Gen. Walker's report for 1872, as United States Commissioner of Indian Affairs, and a colored map. This extract gives an account of the numbers, location, and general condition of every important tribe and band, and will be found of permanent value for reference, as well as, in connection with the foregoing articles, for a right understanding of the vexed "Indian Question" which gives the book its title. But little space would have been required for the reproduction of the tabular list of Indian reservations printed in Gen. Fry's 'Outline Descriptions of the Posts in the Military Division of the Missouri' (Chicago, 1872), which gives the name of the reservation and of the tribe occupying it, the population, area in acres and square miles, and the date of the treaty or law establishing the reserve.——Henry Holt & Co. have in press a volume of modern *vers de société*, gathered from Locker, Landor, Swinburne, Praed, Thackeray, etc.

—Scribner, Armstrong & Co. have now for sale Whitaker's 'Reference Catalogue of Current Literature.' This does for the English publishers what Mr. Leypoldt's 'Trade-List Annual' had already done for American, setting an example the value of which was quickly appreciated on the other side. It seems a miracle of binding, but we have an entirely "practicable" volume of 3,200 pages 8vo, weighing seven pounds. It contains 111 catalogues, embracing "probably not less than 50,000 full titles"; and its utility is greatly enhanced by a topical index of some 14,000 articles, guided by which any book worth the trouble can pretty certainly be discovered if sought for. On this account, it deserves a place in every public library as a book of reference. An edition of 4,000 copies was printed, and disposed of in advance of publication, and we presume the number for sale in this country is limited, over and above the subscriptions which Mr. Leypoldt has been for some time receiving in Mr. Whitaker's behalf. Booksellers not more than readers are under obligations to both of these gentlemen, Mr. Whitaker's title suggesting a usefulness which pertains equally to Mr. Leypoldt's work, or at least in the measure of the thoroughness of its index.

—The Boston *Transcript* published last week what it called "a carefully arranged statement showing how the John Brown Song was ushered into notice"—a statement intended to set at rest the long dispute as to the authorship of that production. We do not know whether it fairly accomplishes so much or not, for a more confused and muddled account of anything has seldom fallen under our notice. So far as we can make out, the true history of the song is as follows: When, in the spring of 1861, the Twelfth Massachusetts Volunteers (commanded by Colonel Fletcher Webster, a son of Daniel Webster) was in quarters on one of the islands in Boston Harbor, some of the men, assisted by some of their visitors from the city, "amused themselves by adapting the words,

> 'John Brown's body lies mouldering in the grave,
> His soul's marching on.
> Glory, glory, hallelujah,
> His soul's marching on,'

to an air of agreeable effect." This verse, says the *Transcript* correspondent (Mr. C. Sprague Hall, who is the reputed author of the song), was at that time the only verse known. That he was the writer of it, he does not say; indeed, our inference from his way of speaking about it is, that he did not write it and does not mean to be understood as claiming it for his property. As for the air to which the words were adapted, Mr. Hall says that he by-and-by was told by a Mr. Greenleaf, an organist resident in Charlestown, Massachusetts, that, as music was wanted for the words, he being then on a visit to the island recalled to mind and applied a certain tune. This we take to have been the tune which has since become so well known, and which Mr. Greenleaf found to give great satisfaction. Mr. Greenleaf in his conversation with Mr. Hall added that the song was assisted to obtain vogue by the fact that there was in the regiment a soldier who bore the name of John Brown; but we imagine that this piece of good luck it could scarcely have failed of in whatever regiment it had first been tried. The tune also was no doubt of much service to the words. Mr. R. G. White has spoken of it as a blackberrying sort of a tune; but the truth is, that as a tune for a body of men to march by there could hardly be a better, and this was a good deal in the days when half the adult male population of America was practising the art of keeping step. And not only had the song this aid to popularity, but a path had been prepared for it in many ways. Somehow, we do not recollect how, it had then for some months been the fashion in Massachusetts for every anti-Republican gathering, and especially for Douglas and Bell-and-Everett processions, to sing in derision of Governor Andrew the words:

> Tell John Andrew,
> Tell John Andrew,
> Tell John Andrew
> John Brown's dead.
>
> Salt won't save him, etc.,
> John Brown's dead.

This again we suppose to have been an adaptation of the farcical doggerel

> Tell Aunt Rhody, etc.,
> The old goose is dead.
>
> Salt won't save him, etc.

Great stress was laid by the singers on the fact of the deadness of John Brown; and we have thought that it was perhaps to this half-savage emphasizing of that fact that we owe the defiance contained in the counter-assertion that the body of Brown might indeed be mouldering in the grave, but that his soul was marching on—a conception to which the praise of sublimity cannot be denied, and which may be regarded as the civil war's chief contribution to literature. We should like to learn definitely from Mr. Hall whether he found this verse of the song "in the air," so to speak, or himself invented it. As we have said, the manner of his speech has led us to suppose him not to be the author of the first two lines, yet they are essentially the song, and a claim to the authorship of the rest of it is hardly worth prosecuting. Mr. Hall thus speaks of the composition of the five closing verses:

"I will now proceed to relate the circumstances by which I was induced to undertake the task, which was very reluctantly done. Now let it be understood that several young men, residents of Charlestown, who were glee-singers, suggested to me that the wants of the public required a song to be started under the title of the 'John Brown Song,' at the same time assuring me that it would be hailed with delight everywhere. In reply to their re-

quest that I should compose such a song, I told them that I was incompetent to conform to their wishes, but would consult with Mr. H. Partridge, of whom I had bought songs, to hire some poet to get it up; but, as he declined, the singers alluded to insisted that I should do my best, and the result is before the world."

Mr. Hall leaves us in the dark about the difference between the early music set to the words and the music of the song as copyrighted. He defends himself, we see, against the accusation of having written the stanza about hanging Jeff Davis to a sour-apple tree, and says that those lines were foisted in by some outsider.

—The legal doctrine of the "Three Degrees of Negligence"—slight, ordinary, and gross—is the subject of an article in the July number of the *American Law Review*, which has an interest not only for the practising lawyer, but for students of the relation which the common law of England bears to the Roman Law, and in fact for any one who is interested in law at all. We have not space to go into the technicalities of this old question. It is enough to say that the writer comes to the conclusion that the doctrine was unknown to the Roman Law, but was invented by Continental and English writers, who have made it survive by sheer force of its own symmetry and verbal convenience till to-day, when it is gradually beginning to crumble and disappear under the attacks of theoretical writers and courts of law. In this country, the survival of the "three degrees" was greatly helped by Story, of whom the writer of this article says, probably with great justice, that

"Mr. Justice Story's writings show that, notwithstanding his familiar acquaintance with the *Corpus Juris*, and with the works of Domat, Cujas, Heineccius, and Pothier, and his remarkable fondness for quoting them, he was not acquainted with the recent labors of those European civilians whose studies have thrown light upon some things in the Roman Law which had been previously obscured by the work of the glossators and the commentators."

The elaborate structure erected with such ingenuity by Sir William Jones upon the foundation of an incorrect reading from Ulpian, and by means of which he arrived at the extraordinary conclusion, that a perfect harmony on the subject of the three degrees of negligence existed not only in the Roman and English, but in the Arabic, the Mosaic, the Attic, the Turkish, the Mohammedan, and the Hindu laws, as well as in "the codes of the Northern barbarians," turns out at last to be a monument of erroneous criticism. The writer of the article makes the suggestion that the whole theory may well have come from the fondness of the earlier Middle-Age interpreters for tripartite divisions of all kinds—"three," according to Aristotle, being the "most perfect number," in fact the "first of numbers; for of *one* we do not speak as a number; of *two* we say both; but *three* is the first number of which we say *all;* moreover, it has a beginning, a middle, and an end." At any rate, there seems to be little or no doubt that the theory is not to be found in the Roman Law, but was the invention of the glossators, conciliators, and commentators, who were suddenly set writing by the discovery said to have been made at Amalfi in 1130.

—The Rev. Mervyn Archdall's great work, the 'Monasticon Hibernicum,' now nearly a hundred years old, if we count from the date of its first publication, and more than a hundred if we count from the time when the laborious author had it ready for the printer, has long needed new annotations which should be in the nature both of corrections to the text and additions to it. In Archdall's day Irish antiquaries were few, and Irish learned societies had hardly an existence at all, but since that time great and well-rewarded research has been carried on in every part of the domain of Irish history, and while Archdall's book has thus, to some extent, been injured, the means has at the same time been found of making it complete. This has now been accomplished. A new edition of it, with notes so voluminous as to take up about one-half as much room as the text, is now in process of publication in monthly parts by Mr. W. B. Kelly of Grafton Street, Dublin. In Great Britain the price of each number is two and sixpence; and of a volume (bound in the Roxburghe style, and containing a third of the whole work) one guinea. The price of the monthly part in this country is a dollar and a quarter.

—An English writer who has recently enlarged his knowledge of a certain herb known to literature, thinks that a competitive examiner of an ungenial mind might procure a good many blanks among the competitors' answers if he should put on his paper the following questions and requirements: "What is samphire? Quote the best English authors who mention it. To what natural family does it belong? Can it be cultivated in gardens? In what manner is it prepared for eating? Give some idea of what it tastes like." The writer thinks that in most of the answers the examiner would doubtless get the lines from "Lear" about "one that gathers samphire, dreadful trade"—a mention, by the way, which has curiously aggrandized the herb in people's minds, and raised it to some such level as ambergris, say, or cochineal. The examiner might also, says the writer, find that a few of his young friends could quote Evelyn, who describes himself as fond of "Sampier, not only pickled but crude and cold, when young and tender, and such as we may cultivate and have in our kitchen gardens most of the year round." A larger number of the competitors, especially if denizens of the eastern counties, might, it is thought, make answer that samphire is a succulent plant; that it grows in salt marshes, occasionally covered by the tide, and grows in such profusion that its cultivation in gardens is needless; that it might, however, be made to thrive on an artificial bank of mud, which could now and then be sluiced with sea-water; that as for the method of cooking it and its taste when cooked, it may, if you like, be made into a dish of greens, when it tastes something like insipid sea-kale, but that usually it is treated raw with pepper and vinegar, under which circumstances it tastes of these two condiments solely and of nothing else whatever. Such have been some of the consequences to the reputation of Shakspere's samphire of a vulgar error of nomenclature; and we may add that the error has extended to this side of the water, where we give the name of samphire, as so many do in England, to the *salicornia herbacea*, or glasswort, instead of to the *crithmum maritimum*, for which the name should be reserved. This latter, the Shaksperian samphire, appears to be a plant easy of cultivation, and one whose acquaintance is worth the making—especially by those healthy natural epicures whose delight is in variety of sauces and such similar preparations as, without quite being food, yet ungrossly suggest it, and afterwards assist its flavor or make of it a new thing. To make a samphire bed it is necessary to dig a hole two feet deep, three feet long, and four feet wide. This should be in a perfectly dry, well-drained, and sheltered spot, and should be filled up with bits of hard chalk to a height of two inches above the surrounding soil. Thus settling is allowed for. On the chalk thus prepared sow the samphire seed, and when it comes up see that it is kept perfectly clear of weeds. The first year, sown in the spring, it gives the cultivator a cutting towards the end of summer; the second year, the plants will be established perennials and need no more care. The leaves and young shoots are to be gathered on a dry day and put into cold vinegar, when, like Tarragon, their own proper virtues preserve them without any help of spices. You thus obtain a highly aromatized vinegar, which is an excellent anti-scorbutic, of great service on shipboard, as well as useful in other ways—chief of which is in being, as we have said, an acceptable ingredient in all sauces. As for the leaves, they are a good pickle, which in taste resembles capers; and they may be served as a salad by such as choose.

—As it was getting to be high time for the prolonged talk and wrangling in the Italian press over the alleged Americo-Italian art frauds to come to something definite, we are glad to find in the Florence *Gazzetta del Popolo*, of July 14, an authoritative declaration on this subject. It is brief and runs as follows:

"In view of a discussion regarding the state of American sculpture in Italy which has been opened in the press of the United States and continued in certain newspapers published in Europe, we, the undersigned, residents of Florence, Italy, desire to make the following statement:

"That corruption of the pure mission of art has been practised for many years by certain sculptors residing in this city and in Rome, we fear there is no reason to doubt.

"Therefore, as individuals who are greatly interested in all that relates to the welfare and the progress of art, we hail with undisguised satisfaction the attempt which has recently been made to expose all that is corrupt and illegitimate in the practices of these sculptors.

"We respectfully invite our friends, resident in the city of Rome, to concur in a corresponding declaration."

This does not name the offending "artists," nor does it furnish specific proof, but it ought to suffice to turn the discussion away from the personal character and opportunities of knowledge of Mr. S. W. Healy, seeing that it is signed, to begin with, by Longworth Powers, as well as by J. T. Hart, John MacNamee, Thomas Ball, and other more or less famous American sculptors; by the editors of several Italian papers, including the *Giornale Artistico*, the *Firenze Artistica*, and the *Nazione, Opinione Nazionale*, and *Rivista Italiana;* by Signor Gotti, director of the Royal Galleries; by Peruggi, the mayor of Florence; by Karl Hillebrand; by a large number of Italian painters and sculptors, and many more witnesses of weight and local distinction.

—The Hungarian correspondent of the *Rivista Europea* is reported by the *Academy* as having made a discovery which is really curious. This is to the effect that the archiepiscopal library of Eger possesses a Latin manuscript (A.D. 1407) of the 'Divina Commedia,' accompanied by a commentary on the 'Inferno,' the author of which was in his time no less a personage than Giovanni da Serravalle, Bishop of Fermo. Of this manuscript Dante there is a duplicate (mentioned by Tiraboschi as probably unique) in the Vatican Library. Of interest to the general reader is the assertion made in the com-

mentary above-mentioned, that Dante was once a student at Oxford. The commentator speaks as follows:

"Iste auctor Dantes dedit se in juventute omnibus artibus liberalibus, studens eos Paduae, Bononiae, demum *Oxoniis* et Parisiis, ubi fecit multos actus mirabilis intantum, quod ab aliquibus dicebatur magnus philosophus ab aliquibus magnus Theologus ab aliquibus magnus Poeta."

This is not exactly the language of affidavits; but probably it is safe to say that the old floating tradition that Dante once studied in England may, as the *Academy* thinks, now be given a higher place in the scale of probability than has hitherto been awarded it.

—Dr. Schliemann, the explorer, writes to the *Academy* that the Greek Government has consented to his pulling down at his own expense the great square tower, known as the Venetian tower, which disfigures the Acropolis, and thrusts itself into every view of that scene. The tower stands eighty feet high; its walls, in part built of slabs taken from the surrounding ancient monuments, are five feet in thickness, and the space occupied by its foundations is 1,600 square feet of the Propylœa. It is estimated that the demolition will cost Dr. Schliemann £465; but he is to have for three years the sole privilege of publishing such inscriptions as he may bring to light, and it is confidently expected that these will be numerous. Whatever the result of his Trojan explorations, Dr. Schliemann is now rendering the public a valuable service. The work began a month ago, on July 2, to the great delight of the Athenians. But, says the Doctor, "it is impossible to please every one in this world," and he has caused the greatest commotion among many thousands of owls who have inhabited the tower, and are now homeless.

GROTE'S CHARACTER AS AN HISTORIAN.*

GROTE'S permanent reputation depends on his history. The publication of his minor works, which unfortunately do not include his remarkable 'Letters on the Politics of Switzerland,' gives the opportunity and the means of considering his character as an historian. The interesting essays edited by Mr. Alexander Bain are not, it is true, mainly historical, though they contain three valuable contributions to the theory of history; but the philosophical essays, which make up the mass of the volume, are themselves of importance in estimating Mr. Grote's position among writers on history. The review, for example, of Sir William Hamilton's philosophy contains a splendid eulogy of James Mill, and a noble tribute of gratitude from his pupil, who owed, in his own judgment, to the historian of British India "an amount of intellectual stimulus and guidance such as he can never forget." This expression of gratitude is as true as it is generous, and points to the fact, which ought never to be forgotten in any estimate of the work done by Grote, that to the philosophical enthusiasm stirred up in his mind by James Mill is due at least half of his literary success. His own great powers, his rare industry, his rarer intellectual singleness of purpose, would of themselves have led him to eminence. But something more was needed to enable him to open a new era in the study of Grecian history. His success was, moreover, achieved under no common difficulty, for he was forced to contend with a man in every respect but one his equal or superior. To expose the fallacies and weakness of Mitford was nothing. To occupy a field which Bishop Thirlwall had marked as his own was a triumph of which any man might be proud. As a scholar, Thirlwall was Grote's superior. He equalled Grote in knowledge, and probably surpassed him in judgment. The Bishop further possessed a greater command of style than his rival, who though a forcible is always an awkward and occasionally an incorrect writer. Grote, nevertheless, as the Bishop had the singular generosity both to see and admit, produced a work which has permanently thrown Dr. Thirlwall's meritorious labors into the shade. The cause of this is that Grote, with some defects, shows a force or grasp and above all an originality of mind and boldness of conception quite foreign to the somewhat episcopal caution of the Bishop's intellect. But this boldness in speculation is due, if in part to nature, in great measure also to the philosophy of James Mill, which taught his pupils not to be overawed by received opinions. "*Ausus vana contemnere*" is often as good a description of the man who has triumphed in the province of philosophical or historical speculation as of the victor who has conquered in the field of battle. Grote's success at least is due above all things to the intellectual boldness which, while it did not lead him to waste his strength on the maintenance of unprofitable paradoxes, enabled him to look at the wants of the past with his own eyes unblinded by traditional phrases or prejudices sanctioned by a weight of high authority. That this is so becomes apparent the moment we consider the two main features which give its originality to Grote's 'History of Greece.' Its first peculiarity is that Grote throughout his history judges of political institutions, and to some extent of politicians, according to the principles of modern civilization, rather than in accordance with the views which have been handed down by writers whose opinions are opposed to all modern ideas of progress. Thus, even so early as 1830 he had begun to look at the ancient democracies in a light quite different from that in which they were regarded by persons who derived their impressions solely from the language of ancient authors whose sympathies are anti-democratic. "Taking," he writes, "these defects" (of the ancient democracies) "at the utmost, and comparing the Grecian democracies with any other form of government, either existing in ancient times or projected by the ancient philosophers, we have no hesitation in pronouncing them decidedly and unquestionably superior. That the securities they provided for good government were lamentably deficient we fully admit, but the oligarchies and monarchies afforded no securities at all." This principle affords the clue which guides him throughout all his criticisms on Athenian history, and it is a clue which, if it occasionally led him into mistakes, far more frequently saved him from fatal errors and led him to perceive truths which were hidden from all other students. The boldness with which he seized on the true character of the ancient democratic governments is itself a specimen of the happy audacity with which he questioned accepted dogmas. In his explanation of the real nature of ostracism; in his marvellously sagacious comments upon the different effects of usury in the modern and in the ancient worlds; in the apt illustration, by parallels drawn from modern history, of events such as the mutilation of the Hermæ, in his defence of the Sophists, there is seen exactly the same keenness of insight and freedom of view which made it possible for him to perceive that the democratic governments of the ancient world were, if not perfect, still the best governments of their day. No one will assert that Mr. Grote's distrust of prejudices did not occasionally lead him to underestimate views of history which, though generally received, were grounded on truth. But even where the opinions he maintained are most open to question, they always bring into view facts which most readers overlook. Few critics, for example, will hold that Mr. Grote's defence of the Sophists is entirely successful. He seems to have underrated the weight which must be attached to the uniformly adverse testimony of ancient writers. But his argument has not been without fruit. No one can write of them as every one wrote of them before the publication of Grote's history. The Sophists had their vices, and Grote has underrated these vices, but no one since he wrote can treat the Sophists as a body who might be described as the Jesuits of antiquity.

The second characteristic of Grote's history is that it is the first attempt made by an historian to estimate the credibility of ancient annals in accordance with avowed and systematic canons of evidence. Niebuhr had already thrown doubt on the credibility of early legends, but he does not seem to have realized to himself, and certainly never placed before his readers, definite principles by which to determine the credibility of existing narratives. Thirlwall, again, in dealing with the legendary history of Greece, clearly showed that his belief in its worth was tempered by the dictates of educated common sense. Yet though in effect he often attached little weight to early traditions, he never lays down any general rules as to the amount of belief which ought to be assigned to the ancient myths. Grote, on the other hand, has clearly fixed principles which he never hesitates to apply. On this point, his essay on Grecian legends and his review of "Sir George C. Lewis on the Credibility of Early Roman History" are most instructive, for they unfold with great lucidity his theory of historical evidence. The fundamental principle on which it rests is that "the *onus probandi* always lies upon the historian, and the simple absence of evidence is sufficient to put him out of court." This rule he applies with the utmost rigor, combining it with another of at least equal importance, viz., that in many states of society alleged facts are believed to have happened, not because of what we in modern days should consider proof of their having taken place, but because of their coincidence with a certain condition of sentiment. Of a great part of the legends which have been handed down as orginally traditions, and have been ultimately received as history, he thus writes:

"They are tales which grow out of and are accommodated to the emotions of the public among whom they circulate. They exemplify and illustrate the partialities or antipathies, the hopes or fears, the religious or political sentiments of a given audience. There is no other evidence to certify them except their plausibility, but that title is amply sufficient."

Combine these two causes, and the result which follows is obvious. You have history as long as you can trace the narrative of past events up to persons who have been witnesses of them. You may also, of course, find evidence for past facts in existing laws or customs, or in laws or customs known to have existed; but where evidence ceases, there history ceases also. Hence Grote rigidly excludes from the field of history all the great myths

* 'The Minor Works of George Grote; with Critical Remarks on his Intel tual Character, Writings, and Speeches. By Alexander Bain.' London: John Murray.

of Greece. He shows both that it is perfectly possible to modify and adapt such legends so as to make them read like history, and further, such modification and adaptation is absolutely worthless. He also shows, and this is a matter deserving the most careful attention, that the tendency to form myths exists in all states of society, though as civilization advances it is kept in check by counteracting influences. Nothing can be happier as an illustration of this tendency than the wild story of Byron, which Grote points out as believed as a fact, without a tittle of real evidence in its support, by no less a person than Goethe. If the historian had written the article in which this illustration occurs in 1870 instead of 1843, he might have drawn further illustrations of the growth of legend from controversies and speculations connected with the history or legend of Byron.

It is, however, of consequence fully to understand Grote's position. He was not a mere historical sceptic. He was not possessed by anything like that rooted disposition to disbelieve received statements which was the weak point in the strong mind of his friend, Sir G. C. Lewis. Few things are in this respect better worth reading than his comments on Lewis's excessive scepticism. Grote points out for example that the weight to be attached to mere inconsistencies in early history may very well be overrated, for discrepancies quite as many and as great are often to be found in the accounts given by witnesses contemporary with the events they narrate, and cites in confirmation of this assertion the almost incredible obscurity in which the facts of the war in La Vendeé have been involved by the carelessness or dishonesty of the persons by whom the accounts of these wars have been given. He, therefore, insists that the spirit of hypothesis and recombination, though often abused in the hands of a writer like Niebuhr, whose imagination certainly at times mastered his judgment, is in itself legitimate. In other words, he held (and this is perfectly consistent with denial of historical character to early myths) that where the particular events of a period could not be traced out because of the want of evidence on which to erect an historical narrative, many general inferences of value may be established by the use of analogy or by comparison with corresponding states of civilization in the history of better-known countries. "What we expect," he writes, "from the further study of the early republic, is not so much a corrected version of the facts of detail as better and clearer views of the institutional practice and development gathered by combination, inference, and cautious hypothesis from a variety of distinct sources." This expectation has in the case to which it refers been fully justified, for the words of Grote might be taken to describe the effect of Mommsen's labors in elucidating the earlier stages of Roman history. It expresses, moreover, the hopes of all judicious students with regard to the earlier periods of history. To turn myth into historical narrative is impossible. What is possible is to substitute for a belief in baseless though long accredited legends a certain amount of knowledge of the early development of society. The great achievement of a writer such as Grote is to have placed the facts we do know in new lights, and by making us perceive distinctly where our knowledge ceases, to have cleared the path for new and fruitful investigation.

RECENT NOVELS.*

'LORD of Himself' is the title of a novel which assumes to portray certain phases of life in Kentucky some thirty years ago. It tells us of the sufferings of a young man, Beauchamp Russell, who is the descendant of a once wealthy family that has lost its money, and in great measure its position, by the carelessness of some of its own members and the greed of some of its neighbors. The hero finds himself in great straits; he has no good horse, no good clothes, no means of earning a livelihood, and he is, of course, in love with a beautiful young woman. Besides these complications, the "peculiar institution" of the South, as it was euphemistically called, makes his position even more embarrassed. Although the beautiful Miss Sherburne confesses her love to him, there comes a slur on his good name, which makes a coolness between them for a time; but that is dispelled, and the novel ends happily. The only fault to be found is that the story is very uninteresting; the author tells us that "every one of its incidents has its foundation and parallel in actual events," but the book is not on that account any more entertaining; it is not all truth that is stranger than fiction. The reader would welcome any amount of invention in the story, if he could only feel that they were genuine people about whom the incidents are told, but none of these characters are remarkably well drawn, they make no very keen impression; every one has met similar uninteresting people in life, it is true, but it is quite as often in the pages of novels that their "foundation and parallel" are to be found. The humor often shows marks of a heavy hand, as, for instance, in the chapter called "Joe Heady's Mat" and in the whole account of Aloysius Pittsinger's courtship and elopement. Some of the remarks are not noticeably happy—for example:

"But we are all similarly foolish once or twice in our lives. The supremacy of mind does not extend beyond its own sphere; in the domain of love all proper men are equal. The professor who murmurs his passion in Sanskrit to a blue-stocking and receives her tender answer in Hebrew, *acts* in precisely the same ludicrously awkward fashion as Aloysius is doing at this moment. Kings have no royal way of wooing, *if they woo;* nor is a countess, in presence of her future lord, free from the timidity and palpitations and the instinctive *acting* which belongs to universal womankind," etc., etc.

This extract is a very good specimen of the commonplace of the greater part of the book, in which fact and fiction have exchanged places.

There is a delicious absurdity about 'Brockley Moor.' All of the characters talk resounding blank verse:

"'Do not forget me—never forget me!' he cried, 'daughter, child of my heart!'

"'Indeed—never, never can I forget you, dear Elric! I will write long letters and tell you everything.'

"'Will you write, daughter? Address your letters to "*Elric*, White Cliff," and you shall hear from me that they are received. Alas! poor child, you have never known a father's love—scarcely a mother's. Let not the world rob me of you, for I cherish you with a parent's affection.'

"'Nay, Elric, if that could be I should be unworthy of your love. If we ever meet again, you will surely find me unchanged.'

"'*Unchanged*, dear Agnes—that cannot be! You go from me untutored, strange to the world's conventionalities—guileless as an infant, pure and unsullied as the flake that falls from heaven upon this foul earth,'" etc.

It is the Old Bowery in full blast.

In 'A Dangerous Game,' Mr. Edmund Yates honors this country, and more especially this city, by introducing them into fiction; many of the characters of the novel, too, are Americans. The story is about Mr. Alston Griswold, a rich business man in New York, who goes to England, under an assumed name, for business purposes, and is there murdered by a false friend of his who has made love to his wife, and who finally receives the punishment due to his crimes. This is not a very attractive tale, and the company to which the reader is introduced is of a sort that is better calculated to show the author's knowledge of what is called the world than to impress upon the reader a gratifying feeling of content with the book. A late French writer, M. Gaboriau, made himself notorious by a similar work, of which the secret lies in representing impossible villains who shall be stained by every crime, and yet with their rigidly cold faces baffle all the policemen in the world, until some almost innocent scrap of evidence convicts them and gets them punished. There is in it all such almost microscopic realism of detail that the reader overlooks the harsh neglect of possibilities which makes of the characters nothing but puppets twirled on an ill-concealed string. When Mr. Yates is deep in murdering and throwing detectives off the track there is a certain interest in his unhealthy writing; there is liveliness, too, in his accounts of the milder villains and demireps, whose good side he is ready to set before us; but when he undertakes to represent a lady or a gentleman, he is off his beat. Helen Griswold is a caricature; her journal is Mr. Yates's attempt at tender pathos, done with the wooden patience with which he works out all the novel, but making the character as lifelike as a china shepherdess is like a peasant-woman. The tone of the work is low—desperately so—and 'A Dangerous Game' is no more than a chastened blood-and-thunder story of the New York *Ledger*.

'Hulda' is a translation, with some modifications, by Mrs. Wister, from the German of Fanny Lewald. It tells the love of the humble pastor's daughter for the Baron Emanuel, and all the suffering that embittered that young woman's path in life. It is not in any way a remarkable novel, but it is tolerably readable; those who read every novel that is published will find it more agreeable than many they are forced to put up with, while those who only read the best are less likely to be enchanted by it. The same praise, however, cannot be given to another translation from the German by the same lady—Marlitt's 'The Second Wife,' namely. This writer managed to make herself known by the 'Old Mam'selle's Secret,' which was a fairly commendable book, but this, her last effort, has almost every fault a novel can have. The heroine, a poverty-stricken German countess by birth, marries a baron, whose sole purpose in marrying is to affront a woman with whom he had formerly been in love, but who had married a loftier suitor; now this faithless one was a widow, and in love with him, but his pride and

vanity alone control him. The countess is the second wife, and has a very hard time in her new home—what with her husband, a vicious old uncle of his, an odalisque living out in a house in the garden, and a priest, who is continually coming and going, and watching everything with his black eyes, and making love to her. It would be hard to say which of the characters is the greatest caricature. The whole book is overdrawn, strained, and absurdly unnatural; still, it is from the German, and will be read, as if the Germans were famous for writing good novels, and only once in a while wrote a dull one by accident.

'Olive Lacey' is rather seriously handicapped by the rest of its title, "a tale of the Irish Rebellion of 1798," but it will be found to conquer whatever aversion the reader may feel to the introduction of history into works of fiction. Too often this combination is an awkward one, and we find hardly anything but a jumble of facts and fancies which give neither information nor amusement. In this novel, however, the characters are well drawn and the incidents are cleverly contrived, so that we have not, to be sure, a masterpiece of fiction, but a very readable, unambitious story that will compare very favorably with most that we have already mentioned.

Much better than any of them, however, is the very charming 'Alcestis,' the latest addition to the admirable 'Leisure Hour Series.' As a story, it is full of interest, and this interest will be doubled for many readers by the fact that it is a musical novel. It rises, in our estimation, far above the moonlight sentimentality of 'Charles Auchester;' with really wonderful skill, never wasting words in trying to define what music is, but representing a man devoted to his profession and struggling against the various temptations which most readily beset his temperament, it gives us the life of a musician, of a composer. There is none of the fashionable psychological analysis, but in its place we have the same result, sympathetic comprehension of the characters, produced by the way in which their actions and words are set before us. The hero, Joaquin Dorioz, loves music, but he also loves the world; he is drawn with greater fairness than is generally the case with heroes who are geniuses, who get from the author all the petting that their originals demand of their mediocre fellow-citizens. His touching experience of life amid the distracting pleasures of court life in the Germany of the last century, with all the intrigues against which he has to struggle, makes a charming and pathetic story. The affection of the singer, Lisa Vaara, for him, and the sacrifice she makes in his behalf, lend the story great beauty, and raise it far above the ordinary tragedy of what might be called the common domestic novel. A great merit, although an incidental one, of the story is the skill with which all the details of the setting are subordinated to the legitimate construction of the novel; in such books it is only too often that we find the author thrusting archæological minutiæ before our notice as assiduously as do most recounters of travels their various bills of fare, but in 'Alcestis' there is no such error committed; the *mise-en-scène* seems accurate, but it is more than that, it is perfectly natural. The characters, as we have said, are all well drawn, and the novel is one that we can recommend to our readers.

There is a sound of truth in this description of the effect produced on Dorioz by hearing the overture of Gluck's "Orfeo ed Eurydice":

"All who love music know it—the power of the first wave of violins in the overture or symphony to wash us of all our dulness and dryness, to carry us straight out from ourselves. In that first delight our personal conflicting seems to be merged into a universal satisfaction, our pitiful dogmas and theories into living, fresh assents. We believe in law and harmony—yea, though it be the unconquerable woe of the world that weighs on our hearts, they rush out to meet joyfully all the sorrow of the world—inhuman, unearthly power of sound! To our musician, the first rush of instruments in the majestic allegro was a spell to break him away from himself, and the strong, fresh overture prepared the hearers for the sublime story of the old Greek."

This is about the only soliloquy of the sort in the book, and it is the absence of rhapsodies, which are generally much less intelligible than this, that makes the story one of real interest.

The name of Richardson has to most readers become of hardly more power than will suffice to bring up before the mind visions of long and prosy volumes about impossible men and women; but the publication of 'Clarissa Harlowe' will enable them to revise such vague notions, got at second-hand from those who have never read him, and probably to feel warmer respect for the critical judgment of their grandfathers, and more especially of their grandmothers. This novel, as we have it in the 'Leisure Hour Series,' is much abridged from its first ponderous size, and made more intelligible by the addition of a few useful notes; we have it really uninjured, however, for the omissions include hardly anything more than tiresome repetitions; the reader's way is only made smooth. What his verdict will be is a matter of little doubt; such different critics as Diderot and Mrs. Barbauld, Rousseau and Dr. Johnson, do not unite in praising a writer of no merit, nor even one without an extraordinary amount of merit; often of late years he has suffered from neglect, and at times from the contempt of critics who have considered it necessary to put up Fielding by setting down Richardson, as if they were playing at see-saw, but it is only necessary to read a few pages of his master-piece, 'Clarissa Harlowe,' to feel his charm, although the form he adopted is one against which prejudice is very common. Fictitious letters have gone out of fashion; but this novel shows us the excellence of the epistolary form. It does infinitely more than that: it sets before us a lovely character suffering every indignity, but rising only purer from its trials; the beauty of Clarissa's nature hides the odiousness of the catastrophe which tends to keep the book one little read; it paints great crimes, but the reader is half consoled by the bitter punishment the villain undergoes in his repentance; and while the book contains what we, who are more squeamish than our ancestors, call coarseness, there is nothing in it that is petty; it deals with great emotions—there is nothing brought in which does not heighten the effect of the tragedy. There is no surer preservative of a fine taste than the frequent return to the acknowledged models, and Richardson is one who is too much forgotten.

'The Vicissitudes of Bessie Fairfax' is an agreeable novel of the utmost simplicity, recounting in a natural way a probable story. The heroine's vicissitudes are not startling; she has both a step-father and a step-mother, to be sure, and some of her relatives are of high birth, and some of her associates are of humbler parentage; she has various lovers, and they have life-like misunderstandings, and at last she marries the man of her choice, and all ends well without any introduction of unnecessary horrors.

Ancient Athens: Its History, Topography, and Remains. By Thomas H. Dyer, LL.D. (London: Bell & Daldy.)—Col. Leake's work upon Athens, though containing a vast store of information, is not well arranged for easy use as a book of reference, and, prior to the appearance of Dyer's 'Ancient Athens,' almost the only work in English easily accessible to the student of Athenian topography and architecture has been Dr. Smith's 'Dictionary of Greek and Roman Geography.' As a mere topographical guide-book for hasty consultation, Smith's 'Dictionary' will not be superseded by Dyer's 'Athens.' The student who seeks for generally accepted conclusions with little care for the processes and discussions by which those conclusions have been reached, and who wishes concise statements rather than elaborate descriptions, will still prefer the 'Dictionary.' He will not secure these advantages, however, without some cost, for, notwithstanding the great merits of that work, the article upon Athens is in some respects not trustworthy, partly because of its acceptance of theories now disputed or discarded, partly because of the large additions to the literature of the subject from recent excavations. The present volume treats the subject much more exhaustively, and is more generally in accord with recent authorities such as Rheinhard ('Map of Ancient Athens, 1868'), Kiepert ('Atlas Antiquus,' fifth edition, 1869), and Dr. Smith's new 'Historical Atlas of Ancient Geography' (London, 1873-74), the classical maps of which are by Dr. Karl Müller. Not only are the results of earlier investigations given, but there is a full description of the discoveries of the last twenty years, especially that of the Dionysiac theatre in 1862. No account of the recent excavations has been attainable heretofore except in scattered notices in various periodicals and in different languages, and it is a great convenience to have all this information incorporated into one volume.

Among the topics treated may be mentioned the legendary history of the city; full discussions of its topography, including the course of the walls, the location of the gates and of the agora, and other disputed matters; the history of its public edifices from their building to their mutilation by earthquakes, Turks, early Christian fanatics, and modern Christian antiquaries; the route of Pausanias, with an attempt to locate some of the objects of interest which he mentions, but which have disappeared; a detailed description of the theatre of Dionysus in its present state, with the inscriptions still existing upon the marble chairs; and references, incidental though often copious, to Athenian history, religion, legislation, and courts of law.

Dyer rejects entirely Forchhammer's theory, accepted by Smith's 'Dictionary,' as to the extent of the city walls, and agrees with Kiepert, Rheinhard, and Dr. Smith's elaborate Atlas in restricting the city to the northern side of the Ilissus. He puts the agora in the hollow between the Theseium and the western end of the Acropolis, and also locates a later agora directly north of the Acropolis, while Smith's 'Dictionary' admits but one, which it places in the hollow directly south of the Areiopagus. Smith's Atlas and Kiepert agree with Dyer in locating the agora with its temples and stoæ, but the former also puts the inscription, *Vetus Agora*, in the hollow south of the Areiopagus, and the latter marks an agora directly

south of the Acropolis, no surrounding structures, however, being figured by either. The temple commonly called the Theseium has no name in Dyer's map, but in the text he advances the hypothesis that it was the Amazoneium. Smith's 'Dictionary' rejects the arguments of Ross against its identification with the temple of Theseus, while Smith's Atlas accepts them, and follows Curtius in calling it a temple of Heracles. Dyer differs from other authorities in removing Cynosarges from near the foot of Lycabettus to a point on the Ilissis just east of the Olympieium. On the other hand, Dyer agrees with Smith's 'Dictionary' as to the genuineness of the Pnyx, and supports his views against Curtius in an elaborate appendix.

The heights of the mountain ranges which bound the plain of Athens purport to be taken from the measurements of the British Survey, and ought to be correct, but they differ materially from those given in Smith's Atlas. Compare the following figures, taken respectively from Dyer and from the Atlas: Hymettus, 3,056, 3,369; Parnes, 4,193, 4,635; Pentelicus, 3,884, 2,559.

In an extended appendix, Dyer attempts to show that the arrangement of the logeium, orchestra, and thymele of the theatre, as given by Suidas and Vitruvius, is not applicable to classic times, and hence has been misinterpreted by Donaldson ('Theatre of the Greeks') and others. He maintains that Vitruvius is not describing the theatre of the great dramatists, but the theatre required in his own time to meet the recent demands of gladiatorial combats; that in the classic age, the stage and the first row of spectators were not elevated ten or twelve feet above the orchestra; and that the part of the orchestra in front of the altar was not covered with a raised wooden platform, called thymele, for the movements of the chorus, the term thymele being restricted to the altar. He is led to this position from an examination of the Dionysiac theatre, in which the stage is raised only four or five feet above the floor of the orchestra, and the first row of seats is on a level with that floor. With such an arrangement, if the chorus had stood upon an elevated platform, the view of the stage would have been wholly cut off from the priests and magistrates, whose reserved seats in the first row were considered the choicest of all. He believes, moreover, that the lozenge-shaped pavement, so conspicuous in all the photographs of the theatre, furnished guiding lines for the files of the chorus in their movement across the orchestra, and that these lines preclude the possibility of a raised platform, by which they would have been completely hidden. This reasoning is plausible, but it would be much more conclusive if the stage and its surroundings were not evidently of a comparatively late date, the remains of the earlier scena being still visible further to the south; and the reasons adduced for the hypothesis that the general arrangements of the classic stage and orchestra were reproduced in the restored theatre of Roman times, cannot be considered so weighty as to put the matter beyond dispute.

This book is a large octavo of 553 pages, well supplied with maps and plans, and illustrated with a few wood-cuts. The publishers have done their work well, and the typographical errors are not numerous. Moreover, the book was evidently written because the author was interested in his subject, and had something new to say upon it.

The Four Civilizations of the World. An Historical Retrospect. By Henry Wikoff, author of 'A Visit to Prince Louis Napoleon at Ham,' 'Political Essays,' etc. (Philadelphia: J. B. Lippincott & Co. 1874. 12mo, pp. 416.)—Mr. Wikoff would have done better if he had called his book 'The Fourth Civilization' rather than the "Four"; for the first three civilizations (including three pages of "A Mystery") occupy but 29 pages out of 416. Neither is the force of the definite article apparent, for we venture to say that nobody could guess off hand what the four are. When we come to examine them, moreover, we see no reason why they might not have been lumped together in one; for the characteristic of the first civilization, Asia, was "the concentration of all the power, wealth, and knowledge in the hands of the upper classes, whilst ignorance, poverty, and slavery were the lot of the lower class"; and as for the second civilization, Africa, "similar physical causes produced a state of society in all respects analogous"; and the third civilization again, Europe, only differed from the others in the fact that it, "intellectually, far surpassed those preceding it." By European civilization, by the way, is understood simply that of ancient Greece and Rome, the fourth civilization being that of Christianity. It will be seen that the substance of Mr. Wikoff's philosophy of history is that the one essential element and criterion of civilization is democracy; any other contributions to humanity made by Egypt, Greece, and Rome are of no account. It is a curious sense of proportion, therefore, which thinks fit to prefix this shallow and cumbrous introduction to a work the immediate aim of which was to "give a concise and intelligible exposition of the history of France, England, and the United States." If that is what Mr. Wikoff wished to do, why did he not do it?

The narrative portions of this work possess considerable merit, and the errors generally come from an insufficient acquaintance with the latest authorities. Page 28, the author speaks of the Roman centuries "consisting of 100 citizens each"; p. 44, we read of Charlemagne "of France"; p. 61 Robert Guiscard is called "another William of Normandy"; p. 153, we read, in connection with some very good remarks, that "the Saxon middle class [the common freeman] possessed no political or municipal privileges till the thirteenth century"; and again, p. 167, that the Parliament of 1265 was "the first appearance of the People on the political stage"; p. 291, that "none but Englishmen could have laid the foundation of a pure democracy" in America, for the reason that the French and Spanish colonists "knew nothing of the representative system."

Sea and Shore: A Collection of Poems. (Boston: Roberts Bros. 1874.)—This is a pretty volume, from which some visitors to the salt sea waves will miss some poems which they will think the compiler should not have omitted; and in which also they will find some pages which they would willingly tear out and cast overboard; but although no great severity o taste has guided the compiler, the collection nevertheless contains much welcome poetry. Glancing over it, one thinks that it might well have begun with Mr. Emerson's "Seashore":

> "I heard or seemed to hear the chiding Sea
> Say, Pilgrim, why so late and slow to come?
> Am I not always here—thy summer home;
> Is not my voice thy music, morn and eve,
> My breath thy healthful climate in the heats,
> My touch thy antidote, my bay thy bath?
> . . . . . .
> "My paths lead out
> The exodus of nations: I disperse
> Men to all shores that front the hoary main."

The reader may partly judge of the character of this collection by looking at some of the names, good and not so good, represented in it: Henry Abbey, Elizabeth Akers, Bret Harte, Matthew Arnold, Thomas G. Appleton, William Allingham, T. B. Aldrich, Barry Gray, C. P. Cranch ("Virgil"), Felicia Hemans ("The Breaking Waves Dashed High"), Cowper, Lord Derby and Mr. Bryant ("Homer"), Julia Ward Howe, Allan Cunningham, Harriet Prescott Spofford, Celia Thaxter, Wordsworth, Lockhart, Swinburne, E. C. Stedman, D. G. Rossetti, Longfellow, Lowell, John Wilson ("Christopher North").

RECENT GOVERNMENT PUBLICATIONS.

Annual Report of the Secretary of the Navy on the Operations of the Department in 1873. Washington: Government Printing Office. 1873. 8vo, pp. 628, and three maps.

This volume is one of unusual interest, in a scientific point of view, from the official details which it gives concerning surveys and explorations for a canal between the Atlantic and Pacific, the transit of Venus, and the *Polaris* expedition; all of them subjects, also, to which the public attention has been strongly directed. The general results of the examinations of the Darien and Nicaragua regions, made with reference to an interoceanic canal, under Commanders Selfridge and Lull, are already familiar to our readers from our notice of the reports of these officers. The whole matter has lately been referred to a Government board for final decision as to what appears to be actually the best route and the best method of accomplishing the object in question. Whether anything will be done by the United States towards constructing the proposed canal is somewhat questionable; if it be undertaken at all, it will probably be by some European nation, in which event the American exploration will be extremely serviceable.

The *Polaris* expedition is treated of at great length, no less than 404 pages of the 628, and three maps, being devoted to this subject. The report gives the full history of the rescue of the Tyson and Buddington parties. On the arrival of the rescued men in Washington, a Board of Investigation was appointed by the Secretary of the Navy, consisting of Commodore Reynolds of the Navy Department, Captain H. W. Hawgate of the Signal Service, and Prof. S. F. Baird of the Smithsonian Institution, the Secretary himself acting as Chairman of the Board. A careful enquiry was entered into as to the history of the voyage, the circumstances attendant upon Captain Hall's death, the separation of the party from the vessel, and their rescue. In the meantime, the steamer *Juniata* was sent, *via* Newfoundland, to Greenland, with a view of preparing the way for the *Tigress*, which it was thought might be obliged to winter in the north, and which followed very soon after. The *Polaris* party that remained on the vessel spent the winter of 1872–73 on the shore at Lifeboat Cove, in latitude 70° 23′, and on the 3d of June, abandoning the *Polaris*, started in boats which they had built, in the hope of reaching the region visited by whalers; and they were actually picked up by a British whaler, the *Ravenscraig*, and carried into Dundee. From this place they returned to Washington, where the Board of

Investigation already mentioned renewed the enquiry on the 11th of October, including the inquest made by the Board of Investigation at Washington, which resulted in the opinion that the death of Captain Hall was caused by apoplexy, and due entirely to natural causes; and that the general results of the exploration of the *Polaris* were of a high value, both geographically and otherwise. Of the maps, the first gives the track of the *Juniata* from Godhaven, Upernavik, etc., as well as that of its steam launch the *Little Juniata*. In the second, we have the tracks of these vessels repeated, as well as that of the *Tigress;* while the third shows the route of the *Polaris*, in its movements between latitudes 78° and 82° 26′—the highest point attained—with the geographical features as corrected or observed for the first time by the *Polaris* party. The most important points of geographical advancement consist in the discovery of a deep fjord, or possibly even a strait, cutting off the northern extremity of Greenland; and an indication of open water north of 82° 15′; and also of points of land further north, the northernmost being estimated at about 84° 40′. Land was also traced nearly as far as this to the west side of Robeson Channel, and of what has been termed the Lincoln Sea. A comparison of this map with Dr. Hayes's chart, published by the Smithsonian Institution, will show the large amount of additional information thus brought to light.

The American Ephemeris and Nautical Almanac for the year 1875. Published by the authority of the Secretary of the Navy. Second edition. Bureau of Navigation, Washington. 1874. 8vo, pp. 528.

It is not many years since vessels of the United States, belonging both to the national and to the merchant marine, depended upon Great Britain for the nautical almanacs used in their voyages. In 1849 an act of Congress was passed authorizing the preparation of an American Ephemeris, which commenced with the volume for 1855, and has ever since been continued. The work is now under the charge of Professor J. H. C. Coffin, Professor of Mathematics, U. S. Navy. The present volume, for 1875, is a second edition, the first having been published in 1872.

Almanac for the Use of Navigators, from the American Ephemeris and Nautical Almanac for the year 1877. Published by authority of the Secretary of the Navy. Bureau of Navigation, Washington. 1874. 8vo, pp. 268.

This portion of the American Ephemeris and Nautical Almanac for 1877, adapted to the meridian of Greenwich, is designed for the special use of navigators. It contains ephemerides of the sun and moon; the distances of the moon from the centres of the sun and the four most conspicuous planets, and from certain fixed stars; the ephemerides of the planets Venus, Mars, Jupiter, and Saturn; and the mean places of one hundred and ninety-eight fixed stars for the beginning of the year 1877. An account of the eclipses of the year, with charts of the solar eclipses, is also given.

Catalogue of the Library of the Surgeon-General's Office, United States Army. In three volumes. Volume III.: Supplement; I. Anonymous; II. Transactions; III. Reports; IV. Periodicals. Washington: Government Printing Office. 1874. Large 8vo, pp. 320.

The library of the Surgeon-General's Office of the United States Army is rapidly advancing to the first rank among the special libraries of this class, at the present time numbering not far from 30,000 volumes, of almost exclusively medical publications, and a very large number of pamphlets. It is contained in the fire-proof building of the Army Medical Museum, formerly Ford's Theatre, and is under the special charge of Dr. J. E. Billings, Surgeon U. S. A. An appropriation is made annually by Congress of $10,000 for the purchase of books and for the support of the Museum; and by an arrangement with the Library of Congress, certain classes of medical works in its charge are transferred to this establishment, among them the medical theses of foreign universities received by the Smithsonian Institution through its foreign exchanges. It forms indeed the medical branch of the Congressional Library, as no purchases of medical books, with the exception of a few general treatises, are now made by the Congressional Library, but are left to that of the Medical Department of the Army. A precisely similar plan of cataloguing is adopted by the two establishments, and it would be purely a mechanical work, of a comparatively slight degree of labor, to melt the smaller into the larger at very short notice.

Senate Report 307. Part I.: Report of the Select Committee on Transportation Routes to the Seaboard, with Appendix and Evidence. Washington: Government Printing Office. 1874. Part II.: Testimony taken.

After a general enquiry into the statistics of the production of cereals in the United States, and all other bulky articles requiring cheap transportation for long distances, and the course of trade in this respect, the Report takes up the consideration of actual competition between water and rail transportation; the defects and abuses of the existing systems of transportation; the constitutional power of Congress to regulate commerce among the several States; the competition between railways and its promotion by the construction of additional lines; direct regulation by Congress; indirect regulation and reduction of charges through the agency of one or more railway lines to be owned or controlled by the Government; and the improvement of natural and construction of artificial water-ways. The water-ways extensively considered are those embracing the lakes and the New York and Canadian Canals, the James River and Kanawha Canal, the Atlantic and Great Western Canal, the Mississippi route, the Ohio River, Kanawha River below the Great Falls, Wisconsin and Fox Rivers improvement, and Rock Island and Hennepin Canal. Other water lines, referred to by the Committee with less detail, are the improvement of the Illinois River, the canals of Pennsylvania, the Chesapeake and Ohio Canal, the Florida Ship Canal, and the improvement of the natural water-ways of the Pacific coast. The Committee recommend that all railway companies engaged in inter-State commerce be required to publish rates and fares, and to receipt for quantity, and account for the same at its destination, and be prohibited from charging more for a less than for a greater distance. Various methods of preventing combinations, consolidations, stock inflation, etc., are also indicated. The construction of double-track freight railways is urged, but the greatest reliance is placed by the Committee upon the improvement and maintenance of reliable water-routes.

Thalheimer (Miss M. E.), Manual of Mediæval and Modern History	(Wilson, Hinkle & Co.)	2 50
Walker (F. S.), The Indian Question	(J. R. Osgood & Co.)	1 50

HENRY HOLT & CO.,
25 BOND STREET, NEW YORK,
Publish Freeman's Historical Course, Fiske's Class-room Taine, and many other Text-books of equal merit, including most of those for Modern Languages used at Yale, Harvard, and similar institutions. Among their miscellaneous publications are works of Maine, Mill, Taine, Tylor, Turgénieff, and many others. Catalogues free.

RAGS AND TAGS NEVER COME on the soles of ENGLISH CHANNEL SHOES. Pretty feet should always be encased in them. Be sure you don't buy anything else. Look on the sole, and you will see where the channel is cut.

SLAVE SONGS OF THE UNITED STATES:
A Unique Collection of Original Melodies—words and music—obtained among the Negroes of the South; preceded by an Account of these Songs, and an Essay on the Negro Dialect, as observed at Port Royal. By Prof. W. F. Allen, of the University of Wisconsin. Cloth, 8vo, price $1 50. Sent, post-paid, on receipt of price by the Publisher of the *Nation*.

HARPER'S CATALOGUE. The attention of those designing to form libraries, or increase their Literary Collections, is respectfully invited to Harper's Catalogue, which comprises a large proportion of the standard and most esteemed works in English Literature—*comprehending over three thousand volumes.*
Librarians, who may not have access to a trustworthy guide in forming the true estimate of literary productions, will find this Catalogue especially valuable for reference.
The Catalogue is arranged alphabetically by the authors' names, anonymous works by their titles. The index is arranged by the titles of the books, besides having numerous appropriate heads, each general head being followed by the titles of all works on that subject.
Harper's Catalogue sent by mail on receipt of ten cents.
Address HARPER & BROTHERS,
Franklin Square, New York.

RIFLES, SHOT-GUNS, REVOLVERS of every kind. Send stamp for Illustrated Price List to
GREAT WESTERN GUN WORKS, Pittsburg, Pa.

THE MOTHER'S REGISTER: A Tabular Record of the Health of Children, from Birth to Maturity. From the French of Prof. J. B. Fonssagrives. "The Mother records for the Physician to interpret." Cloth, 12mo. A separate volume for Boys and for Girls. Price, singly, 75 cents; for two $1 25. Sent, post-paid, on receipt of price by the Publisher of the *Nation*.

NOW READY.
The Cheapest Book ever Published.
TRIBUNE POPULAR SCIENCE. By Agassiz, Proctor, Chandler, Hammond, Brown-Séquard, Bayard Taylor, and others, and containing "The Wheeler Explorations" and "The Meeting of the Academy of Science." 8vo, printed on fine paper, bound in extra cloth. Fully illustrated, $1 50.
The authorized editions of Jules Verne's celebrated books, 'Adventures in the Land of the Behemoth.' Cloth extra, tinted paper, illustrated, $1. 'A Journey to the Centre of the Earth.' Cloth extra, illustrated, as handsome as the $3 rival edition, for $1.
Ask for Shepard's editions.

Publishers, Boston.

FOREIGN BOOKS Reviewed in the *Nation*, and books in all languages, at SCHOENHOF & MOELLER'S, Importers, 40 Winter Street, Boston.

THE WEEK IN TRADE AND FINANCE.

NEW YORK, August 3.

THE money market has remained easy at the rates last quoted—2 to 3 per cent. on call—and, judging from the present outlook for increased activity in the different branches of business, the prospect is that very little change will take place in rates until the latter part of the month or early in September. The indications are that money will be easy throughout the fall, notwithstanding the demand which will arise for the purpose of "moving the crops." Commercial paper is in good demand at low rates, especially for firm names having a short time to run. Paper running 60 and 90 days has been placed during the week at 5 to 6 per cent.

There is a somewhat firmer feeling in the London market for money, the Bank of England having raised its minimum discount rate from 2½ to 3 per cent., owing to a heavy loss in bullion for the week ending on Thursday last.

The weekly statement of the New York banks on Saturday was very favorable, showing a still further gain of $1,144,100 in the surplus reserve. The excess of reserve now held by the banks over the legal requirement is $30,427,275. The following statement shows the changes in the different items:

	July 25.	August 1.	Differences.	
Loans	$284,168,100	$282,012,600	Dec..	$2,155,500
Specie	26,646,700	25,293,700	Dec..	1,353,000
Legal tenders	63,714,800	65,818,900	Inc...	2,104,100
Deposits	244,313,300	242,741,300	Dec..	1,572,000
Circulation	25,767,600	25,762,200	Dec..	5,400

The following shows the relations between the total reserve and the total liabilities:

	July 25.	August 1.	Differences.	
Specie	$26,646,700	$25,293,700	Dec...	$1,353,000
Legal tenders	63,714,800	65,818,900	Inc...	2,104,100
Total reserve	$90,361,500	$91,112,600	Inc..	$751,100
Reserve required against deposits	61,078,325	60,685,325		
Excess of reserve above legal requirem't,	29,283,175	30,427,275	Inc...	1,144,100

The stock market has been very dull. Prices, however, have remained quite strong, and the quotations on some of the speculative stocks show an improvement at the end of the week over those current at the commencement. To-day the market opened strong, and was at times quite active in Lake Shore, Western Union, and Union Pacific. The sales of the day foot up about 80,000 shares. The market was never so free from speculative influences as it is at present. The large operators, including Mr. Gould, have been absent from the city during the week, and the result was, that for several days the Stock Exchange was almost entirely neglected.

Nothing official has been published regarding the negotiation of the new fives by the Treasury. So far as is known, the total award of bonds made was $55,000,000—$10,000,000 at par in gold and accrued interest to private investors, and $45,000,000 at par and interest in gold, less ¼ per cent. commission, to the Syndicate composed of the Messrs. Seligman and A. Belmont & Co., together with the foreign houses which they represent and the First National Bank of this city, with the option of a "call" for the remaining $124,000,000 at the same price for the period of six months. The Secretary of the Treasury on Monday issued a call for the presentation of 25,000,000 5-20's of 1862 on or before the 1st of November next for redemption, after which date interest upon them will cease. The people have not been able to understand as yet why the Treasury rejected the bids, amounting to nearly $15,000,000, made at par, less ¼ per cent. commission, and accepted that made by the Syndicate; while the call of the Treasury for only $25,000,000 5-20's, when $55,000,000 new fives have been taken, has led to considerable discussion, and has given rise to the opinion that an understanding was had by the Secretary with the Syndicate before the Treasury issued its circular inviting proposals from the public for the remaining unissued 5 per cent. bonds, and that the circular was issued merely for the purpose of satisfying public opinion, while the real object was to treat with the Syndicate.

The market for Government bonds has been unsettled by reason of the Treasury operations. The following are the closing quotations this evening:

	BID.	ASKED		BID.	ASKED
Registered 6's, 1881, c	118¼	118⅛	Registered 5-20, 1867, c	117¼	117⅜
Registered 5-20, 1862, c	111	112	Registered 5-20, 1868, c	118	118⅛
Registered 5-20, 1864, c	115⅝	115⅞	Registered 10-40's, c	113¼	113¾
Registered 5-20, 1865, M and N	114½	115	Registered 5-20's of 1881	111½	112
Registered 5-20, 1865, J and J	116	116⅛	U. S. Currency 6's	117⅛	117¾

The Secretary has ordered the sale of $5,000,000 gold during the present month. The following shows the fluctuations in the gold premium during the week:

	Opening.	*Highest.*	*Lowest.*	*Closing.*
Monday, July 27	109¾	109⅞	109⅝	109⅝
Tuesday, July 28	109⅝	109⅞	109	109⅛
Wednesday, July 29	109	109⅜	109	109⅜
Thursday, July 30	109⅛	109⅝	109¼	109½
Friday, July 31	109¼	109½	109	109⅜
Saturday, Aug. 1	109⅜	109⅝	109¼	109⅜

SPECIAL NOTICES.

TERMS: In advance, one insertion, four cents per word; five insertions, three cents per word, each. The enclosure of a stamped and addressed envelope will secure a numbered box, to which communications may be addressed.

A Graduate (with Classical Fellowship) of Princeton, who has studied abroad, takes in New York or vicinity private pupils preparing for college. References. Address Box 14, *Nation* office.

An Oxford M. A., of many years' experience in teaching in England and America, desires a situation as a Classical Master. Would prepare pupils for the English or American Universities. High references given on application to H. H., 1912 Latona Street, Philadelphia.

An Experienced Principal, College-bred, desires position. Address, stating salary, EXPERIENCE, *Nation* office.

A Vassar Graduate, an experienced teacher, desires a re-engagement. Address Box 12, *Nation* office.

A Graduate of Brown University, of ten years' standing, desires a position as Professor of Botany or Natural Science generally in some College or similar institution. For information and references of the best character, apply to W. W. Bailey, B.P., Providence, R.I.

Finishing Governess.—An English Lady of several years' experience desires an engagement in a gentleman's family in New York or Boston. Acquirements: thorough English, French, German, Italian, Music, and Drawing. Address Miss JAMIESON, care of Rev. Gerald Lermit, D.D., Dedham, Essex, England. Preliminary enquiries can be addressed to Box 18, *Nation* Office.

German Language.—Having some mornings free, I wish to employ them in private schools, and am now ready to make arrangements for next fall. E. C. F. KRAUSS, 82 Waltham Street, formerly 53 Temple Street, Boston.

Art Anatomy.—Instruction given in all the higher departments of Art. Address W. RIMMER, [illegible] YOUNG, Cambridge, Mass.

SPECIAL NOTICES.

TERMS: In advance, one insertion, four cents per word; five insertions, three cents per word, each. The enclosure of a stamped and addressed envelope will secure a numbered box, to which communications may be addressed.

Two Young Ladies, Experienced Teachers, would like situations as teachers or governesses. Will teach Latin, French, Mathematics, and the English branches of education. Satisfactory references given. Address "J. C. G.," 312 Congress Street, Portland, Maine.

Those Seeking Admission to Harvard, Yale, or any other American College, to Sheffield or Lawrence Scientific School, or any School of Technology, can receive thorough preparation at ROGERS HIGH SCHOOL, Newport, R. I. Special provision made for Laboratory Practice. Tuition, $60 per annum. Frederic W. Tilton, A.M. (late Principal of Phillips Academy), Head-Master.

Wanted—An experienced Gentleman Teacher to take charge of classes in German and Latin in a well-established Academy. Address P. O. Box 1574, Battle Creek, Mich.

Wanted.—A situation as Editor on a Liberal or Democratic paper, by a gentleman of liberal education and some experience. Best of references. Address Box 13, *Nation* office.

Mr. George Street, London, Agent of the *Nation* for Great Britain, receives Subscriptions and Advertisements for this paper. GEORGE STREET, 30 Cornhill, London, E.C.

School of Mines, Columbia College.—Courses in Mining and Civil Engineering, Geology, Mineralogy, Chemistry, Assaying, etc., etc. Send for catalogue. C. F. CHANDLER, Dean of Faculty, East Forty-ninth Street, New York.

Harvard University Divinity School.—This School is open, on equal terms, to persons of all denominations, and the next term will begin September 24. Information in regard to admission and pecuniary aid will be sent on application to Prof. OLIVER STE[illegible]

SPECIAL NOTICES.

TERMS: In advance, one insertion, four cents per word; five insertions, three cents per word, each. The enclosure of a stamped and addressed envelope will secure a numbered box, to which communications may be addressed.

Yale College—Law Department. Address Prof. FRANCIS WAYLAND, New Haven, Conn.

Sheffield Scientific School of Yale College. Information by addressing Prof. G. J. BRUSH, New Haven, Ct.

Massachusetts Agricultural College, W. S. CLARK, President, Amherst, Mass. Eleventh Annual Report gratis.

University of the City of New York.—Medical Department. Address Prof. CHAS. INSLEE PARDEE, M.D., 426 E. 26th Street., New York City.

Elmira Female College.—This is a college of the highest rank, for well-prepared students. It has also Eclectic and Preparatory Departments, and superior instruction in Music and Art. Terms moderate. Send for catalogue to Rev. A. W. COWLES, D.D., Elmira, N. Y. Next session begins September 9.

Mrs. and Miss Gilliat propose to open a Boarding and Day-School for Girls of the age of twelve years and upwards, on the 24th of September next, in Newport, R. I. References: Bishop Williams, Conn.; Bishop Clark, R. I.; Rev. A. H. Vinton, D.D., Boston; Rev. I. P. White, D.D., Newport; Rev. Wm. S. Child, Newport; Alex. Duncan, Esq., Wm. Butler Duncan, Esq., N. Y.; Augustus Hoppin, Esq., Providence. For particulars, apply during the present summer to Mrs. JOHN H. GILLIAT, Pomfret, Conn.

Miss Marie Hilken's Institute for Young Ladies, located at Feldstrasse, No. 6, Hanover, Germany. References: John Stellmann, Esq., Baltimore; Christian Ax, Esq., Baltimore; Dr. D. W. Brickell, New Orleans; Rev. A. P. Perfect, Rector St. John's sub Castro, Lewes, England; Lt.-General Lewis, [illegible] Chester [illegible] Austin Friars, London, England.

The Nation.

NEW YORK, THURSDAY, AUGUST 13, 1874.

The Week.

BECAUSE of the dull times—only relieved for the newspapers by the local scandal case—the election in North Carolina has been made to assume something of the importance as a matter of news which it had two years ago. At that time guns were fired in honor of it not by one party alone, but by both; by the Democrats, who were induced to be joyful by the first returns; by the more worldly-wise Republicans, who knew how slowly returns would come in from the mountain counties, to say nothing of certain other counties. There has been little reason, however, why there should be excitement this time, as Thursday's result was a foregone conclusion. It is doubtful if more than a minority of persons who have an ordinary knowledge of the facts suppose that in 1872 the Republicans carried the State by eighteen hundred and odd majority, or, in fact, by any majority; and it certainly is not surprising that the majority now should be several thousand the other way. The Civil-Rights Bill discussion would alone be enough to account for such a result, for doubtless that measure is unpleasing to many of those Southern Republicans, of whom North Carolina has thousands, who are Republicans from principle and not from official mock-zealotry. We wish to be understood as speaking only of Southern white Republicans. It is said that of the eight Congressmen the Democrats will have seven, instead of five as they have now. It is not said whether either of the new men is of special ability.

Mr. Daniel W. Voorhees has formally opened the Democratic campaign in Indiana in a speech at Terre Haute in reply to Senator Morton, said to have been delivered to a large and enthusiastic audience. The most interesting and original part of Mr. Voorhees's speech was naturally that in which he discussed the financial question, he being not merely a repudiationist, but a repudiationist on principle; he says not only that the United States had the right to pay the five-twenty bonds in paper, but that it would be an infamous swindle to pay them in anything else; and the act of 1869, by which Congress declared them payable in gold, he characterizes by saying that "with the incoming of Grant's Administration, bonds to the amount of fifteen hundred millions, which were confessedly payable in currency by existing laws, were changed into gold bonds—as far, at least, as such a crime against the people can be successful—thus fraudulently adding to the national debt from thirty to forty per cent. on every dollar we rightfully owe;" he declares that a "greater iniquity than this has hardly happened in American history. A government that thus plunders its own laboring masses and repudiates its own laws in order to still further gorge the rich, needs a change of officials at its head, to use no harsher expression." With regard to the currency, it need hardly be mentioned that Mr. Voorhees is no friend of the "monster of contraction"; but he says that "it must not be supposed that the Democratic party will do anything rash on the subject." What he proposes is, "to convert an interest-bearing bonded debt of twelve hundred millions into a non-interest-bearing circulating medium." This he thinks can be done "at such intervals and under such circumstances as not to derange or unsettle the legitimate currents of trade and commerce." There are, he says, "fifteen years" in which to carry out this plan; but there is probably a longer time than that. No one can read Mr. Voorhees's wild harangue, at the same time reflecting on the leading position he is always given in Democratic politics, without understanding the reason why Democratic reform seems so impossible.

We have received several communications from New Orleans in reference to the objects of the White League; the injustice of charging it with being a body of ill-judging men; and the probability that it will be successful in reforming the affairs of Louisiana. One correspondent informs us that the writers who drew up the Leaguers' address or platform are gentlemen filling in New Orleans the position of Mr. O'Conor and Mr. Evarts in this city; and that with these are associated business men who represent the enterprise, wealth, and integrity of the community, professional men of the highest character—in short, the best citizens, and all of them. He defends the platform as not being the work of impatient and headlong men, apparently ready for another 1866 riot, and by implication pronounces the document judicious. We are still of a contrary opinion as regards some of its language, having recently been confirmed in our own view by the comments of the Southern press upon the Southern elections. The Civil-Rights Bill is their chief topic, and that this is so suggests some reflections which we believe our friends of the White League will do well to keep still in mind. As generally looked at from the exclusively Southern side, and again as looked at by other eyes from the exclusively Northern side, civil-rights legislation seems a simple enough affair: the Southerner declares it a wilfully imposed sign of subjugation and a determined attempt to make the negro his equal and degrade him in the eyes of his former servants. The Northerner denies this, thinks the Southerner unreasonable, and asserts that civil-rights bills are legitimate results of the war, which it is only a duty to secure. He cannot sympathize with the Southerner in his social difficulty, nor can the Southerner believe for a moment in his humanitarianism.

It has been because of the difficulty of reconciling these two views of the facts that so many thousands of good men at the North have reluctantly but without real hesitation ranged themselves at all necessary junctures behind the Mortons and Chandlers. The Southern people would not reassure them; and there was never even so much as a watering-place congeries of Southern statesmen with the wit or the will to try. The Leaguers may have better information than we of a decay in the North of the feeling that, as regards the negro, the South will bear to be watched. Some decay there has been; how much, nobody yet knows; but how much there was of the feeling to be removed the Leaguers can partly guess by reflecting on the equanimity with which the North has now for years regarded the condition of Louisiana herself and South Carolina. Do the White Leaguers think this apathy had no meaning and no deep root? We hope better days are in store for them and are coming soon; but we still suggest that if only out of abundant and superabundant caution, and to leave the foe no chance, Southern political leaders should stop such utterances as this. It is from the Leaguers' platform:

"But it is worse than idle to reason with those people [the Louisiana colored voters]. They have become maddened by the hatred and conceit of race, and it has become our duty to save them and to save ourselves from the fatal probabilities of their stupid extravagance and reckless vanity."

How? As reasoning is given up, and the blacks are in a majority, what must this threat mean?

The curious mental as well as moral perversion which characterizes much of the attitude of the Grangers towards the railroads, finds a good illustration in a recent letter of a correspondent of the *Tribune*, who is giving some account of the state of opinion in Minnesota about the railroads and the currency. Speaking of what a projected extension of the Minneapolis and St. Louis Railroad would have cost if it had ever been constructed on the plan on which it was proposed to construct it (by a heavy issue of bonds), and of the

consequently high rates the farmers would have had to pay in order to furnish the required amount of interest, the writer says:

"I know that the capitalists, both at home and abroad, who have invested their money in railroad bonds, have very seldom been in these 'rings' or had anything to do with the stealing of which so much complaint is made, and that as innocent men they ought to be protected from loss. But the farmers reply that they too are innocent; they get none of the plunder; and to expect them to pay these high rates in order to enable the company to pay the interest on bonds that ought never to have been issued, seems to them like robbing Peter to pay Paul."

Here we see that the farmer, who has not put a cent or may not have put a cent into the construction of a road, claims in virtue of the fact that he lives near it, and may have to use it occasionally, all the rights and privileges of a proprietor; and unless he is satisfied with the amount of bonds the real originators and constructors of the road have issued, maintains that he may confiscate it all to his own use. If it is "robbing him to charge him high rates," however, it would be robbery in a still greater degree to stop working the road altogether. It seems, too, to follow from this that it is also "robbing the farmer" to refuse to advance money to construct a road in any place in which he needs one, because this is the same thing in effect as charging him more for transportation than he can afford or wishes to pay. *De non utilibus et non existentibus eadem est ratio.* Therefore, anybody who has refused to lend money to make a railroad is, or ought to be, from the Grangers' point of view, as great a rascal as the man who has bought bonds at seventy-five cents on the dollar. In both cases the farmer is hindered from getting his produce to market. In the latter case "Peter is robbed to pay Paul," but in the former Peter is stripped of everything. The difference is that the farmer cannot get at the man who would not lend, but, according to Granger logic, if he could get at him, he would be justified in taking as much of his dividends as would make it pay to carry Minnesota or Oregon corn to Liverpool.

The telegraph sends accounts of a negro war in Northern Mississippi, the story being that twelve hundred negroes have invested the town of Austin. Austin is situated in a county where, according to the last census, the negroes outnumbered the whites nearly three to one, and there may be no mistake as regards the strength in which the investing forces appear, but the telegrams remind one a little of the days just "after the surrender," when the Associated Press seemed to have taken into its employ at its Southern stations large numbers of disbanded Confederate officers. It is impossible to tell from the despatches sent exactly what has happened at Austin, or how blame is to be distributed, but apparently a certain amount of exaggeration has been done, and the importance of the affair is likely to be overestimated. It would seem that some weeks since a Dr. Smith "had a difficulty" with a negro, who, meeting him in the street, tried to shoot him. Dr. Smith returned the fire, but missed the man and accidentally killed a little negro girl standing by. This is said to have so enraged the colored population of the neighborhood that they attempted to apply lynch-law to the homicide, but were prevailed upon by the entreaties of Mrs. Smith and the mayor of the town to release him and let him go to jail instead of being hanged. But after a brief imprisonment "some friends came and carried him to Hernando." Upon this, we are informed, the negroes assembled, demanded Smith's return, and threatened, in case he was not brought back, to burn the town. The whites, it seems, answered the demand by barricading the streets as well as they could and telegraphing at once for aid, not to Governor Ames, but to the authorities of neighboring towns, and the response appears to have been prompt. We hear also of re-enforcements going to the negroes from the surrounding country, but we may safely expect to hear that the riot has turned out, in the result at least, like the old-fashioned ones in which the negroes used to advance precipitately on the woods, throwing away their arms and luring the terrified whites to follow them. The early part of this chapter of Southwestern social life—that in which Dr. Smith began operations—we shall probably not hear till later.

The Mayor's answer to the charges against him has been published by the Governor, but has not been well received. The Mayor says, first, that the Assembly Committee on Cities, which wanted him to investigate the condition of the Police Commission, brought no specific charges, and so he did not consider it necessary to institute any enquiry, particularly as in his own opinion the Police Board has never been so efficient a body as during his present administration; and that the Board of Aldermen's request that he should remove the commissioners was absurd, because it was based on nothing but the report of the Assembly Committee. Having thus disposed of the first charge, he proceeds to consider the second, and shows that the offence of which Charlick and Gardner were convicted (removing an inspector without a written notice) was a mere technical violation of law, and involved no moral guilt or violation of the oath of office; his reappointment of them to office being consequently not a crime, but a meritorious action—which is a view radically different from that hitherto taken in any quarter. He admits in another part of his defence that the aldermen did, on the 20th of June, make specific charges; but understanding that the same charges were covered by a pending indictment, and being pressed for time, he did not consider it necessary to look into them. The Mayor discusses the question at great length, divides it into appropriate heads, looks at it from the point of view of the good citizen, the good mayor, and the good governor, and from the moral as well as the legal side, and altogether makes his paper such an elaborate contribution to the science of government that the reader is almost inclined to believe that he is reading arguments in defence of eternal principles of right and justice, instead of a shrewd defence of the writer's support, maintenance, and patronage of two notorious, rascally politicians. More charges have been brought against the Mayor, but there seems little probability that the Governor will take any further steps in the matter, as the old gentleman's term of office expires in a few months. His usefulness to the cause of reform would appear—as we have heard it gently said of police officers discovered to have entered into doubtful relations with leading cracksmen—to be "a thing of the past."

The latest move in the municipal game is an attempt on the official life of Mr. Green, whose enemies have endeavored to have him indicted by the Grand Jury for "lobbying." The charge against him is that during the struggles at Albany over the charter he employed Mr. Dexter A. Hawkins, as special counsel for the city, to make arguments before committees for the purpose of preventing the passage of bills prejudicial to the city or to his own interest without warrant of law, or if with apparent warrant of law, then that Mr. Green sent Mr. Hawkins to Albany to keep him, Mr. Green, in office, and not for the alleged object of making arguments affecting municipal interests. To this Mr. Green's reply is, as we believe it always has been (for the charges are rather stale), that he had authority of law to make an agreement with Mr. Hawkins for precisely such objects as those to which that gentleman's arguments related. By way of a still more effective answer, however, he has suddenly filled the Deputy-Controller's office, which it appears has been kept vacant ever since the days of the Ring, by placing in it a Mr. Earle, who can be relied upon to manage the Controllership faithfully in case Mr. Green should suddenly be sent to jail or removed from office. The charges against the latter are frivolous to an extreme. The use of indictments as a political weapon is so convenient that it will probably be found necessary to guard it against abuse much more thoroughly than has yet been done.

The Beecher-Tilton case drags along slowly, but apparently seems to be drawing very near to its end. Mr. F. D. Moulton has been the principal figure this week, and the sum of what is to be said about him as a witness appears to be that he has practically refused to testify. It is very unsafe, however, to say anything positively about any part of this remarkable case. In all our acquaintance with newspapers, unless perhaps at the times when two

candidates for the Presidency have been up for election, we have never known the editorial fraternity pestered with the iteration of more mendacity, distortion of truth, and suggestion of falsehood than they have had to endure in this case. So far as we make out, Mr. Moulton, who has never spared to tell the committee in effect that as friends of Mr. Beecher they had better leave the Moulton deposit of letters alone, is still the custodian of his friends' secrets. He appears to have furnished the committee with full copies of so many of the original letters as will enable them to compare an entire original with each of the imperfect copies used by Mr. Tilton in making his statement.

The Ross case has advanced no further this week, except for the fact having come out that the father declines to allow any of the authorities to see the letters he has received from the kidnappers, a refusal which is supposed to point to some family quarrel as the origin of the abduction. The Philadelphia police, however, have distinguished themselves by a display of vigilance and ingenuity which has rarely been equalled. They have carefully searched every house in the corporate limits of Philadelphia, and, in order to prevent hard feeling, they gave notice some days before through the press that they were going to make this domiciliary investigation—a notice which enabled every one to prepare for it, so that all suspicious-looking valuables, or other evidences of crime, were removed, and the officers were received by the thieves, kidnappers, fences, counterfeiters, confidence-men, gamblers, and murderers of Philadelphia, in their various retreats, in the frankest and most cordial manner. Only one citizen, it is reported, made any objection, and he on the curious ground that the searching of private residences without warrant is illegal. This citizen is said to be an old man, and perhaps on that account does not keep up with the times. The police behaved in all cases with the greatest politeness and consideration, even going so far in houses in which people were lying at the point of death as to refrain from any of the loud shouting or boisterous profanity in which they might so easily have indulged, so that it is not believed that death will be hastened by the search in more than one or two cases. Strange to say, the boy was not found.

The correspondence between our Government and that of Great Britain on the subject of the "Three Rules" under the *Alabama* Treaty has been made public in England, and given rise to a good deal of discussion. The two Governments have been in correspondence on the subject since June 12, 1871, without coming to a sufficiently clear understanding as to the meaning of the rules to enable them to be brought to the notice of other powers, as intended by the Treaty. The general conclusion arrived at by the English press seems to be that, as the rules are likely to prove a serious embarrassment to neutrals, it is on the whole fortunate that the matter remains where it is. With regard to public feeling in this country on the subject of the "Three Rules," it cannot be said that there is any, public sentiment about the *Alabama* having had very little that was abstract or technical in its character, and having been mainly caused by the concrete injury suffered from a particular ship rather than by any wide or comprehensive interest in the duties of neutrals. We should almost be willing to go so far as to say, that if Lord Granville's successor and Mr. Fish should, by the adoption of some ingenious system of hermeneutics, arrive at the conclusion that the new rules amounted to nothing more than an explicit declaration of the old international law on the subject, not a hundred persons in the United States, except students of law, would care to remember what the rules were, and of those hundred ninety-nine would be glad of the result.

The coal and iron miners in England, after having had swimming times for three years, and having in vain striven by means of strikes to keep wages where they were before the collapse last fall, are now accepting from 20 to 40 per cent. reduction from their employers. There is, in fact, nothing left for the leaders to do but to counsel the men to make what terms they can, though this advice is sure to bring odium upon those who gave it, who are loudly accused of "selling out." As might be expected, so long as their executive and agents encourage the demand for higher wages, they retain the confidence of the members of the Union; but, as *Capital and Labor* remarks, when "the same men advise the miners to accede to a reduction, they rebel, and many of them challenge not only the judgment of their leaders, but even their honesty of intention." The same paper, in reviewing the behavior of the miners unions during the excited period 1871–73, shows that these bodies, "the more demand and wages rose, set themselves the more determinedly to prevent an increase of labor, and fenced the pit-heads all the more violently against new-comers. When wages are high, workmen will labor more steadily and actively than when wages are low. This is a doctrine based logically enough on the ordinary intelligent instincts of human nature. But under the action of the miners' unions it was completely reversed. The higher wages rose they worked less, restricting their days to five and four in the week; and nothing is more remarkable than that, under all the stimulation of mining industry in 1871, 1872, and 1873, the aggregate mining production of the United Kingdom has seldom increased in so small a ratio, and never so out of all proportion to demand, as in these years."

Algeria has always been a colony of rather questionable utility to France, having no other advantages than those of a training-school for soldiers, and, judging by the evidence of the Franco-Prussian war, not a very good training-school at that. An engineering scheme, however, is now on foot which may render it a possession of greater value than heretofore. This scheme is to let in the Mediterranean into the bed of an old inland sea, lying partly in Algeria and partly in Tunis, about 160 leagues long and 20 in width, and thus create a "Baltic of the Mediterranean." A staff officer selected by the Minister of War to study the subject has reported that this is feasible, and M. Lesseps is said to have expressed his opinion that it may easily be done at the expense of $2,500,000. The sea existed in former times, but the formation of banks intercepted its communication with the Mediterranean, the African sun dried up the water, and the sea became land. A cutting 18 kilometres in length would suffice, it is said, to fill it up again. The Superior Council of Algeria, presided over by General Chanzy, voted towards the end of last year funds for the preliminary work, and in the National Assembly a credit of $2,000 has lately been voted to continue them. It is supposed that the resources of modern science are quite equal to the task of keeping open the communication with the Mediterranean, and great expectations are formed as to the fertilizing effects upon the surrounding country of the admission of such a vast body of water.

The resignation of the well-known French Financial Minister, M. Magne, is explained by his failure to get the Assembly to agree to his proposals with regard to the repayment of the money lent to the Government by the Bank of France during the war. About $250,000,000 were borrowed of the Bank at 1 per cent., and when M. Thiers came into power he laid it down as a fundamental principle of his financial policy that this should be repaid as soon as possible, and from that time it has been accepted as a necessity that $40,000,000 should be set aside for that purpose annually. There was no obligation to do so, for the Bank has been willing, it is understood, that some other arrangement should be made; and even if that were impossible the money might be raised by a loan much more easily than by taxation. But the policy has been adhered to to the last, and his proposed taxes for the purpose of raising the $40,000,000, or for covering the deficit if the $40,000,000 were paid, all proving unpopular with the Assembly, M. Magne resigned. The Assembly seems now committed to a reduction of the payment to the Bank from $40,000,000 to $30,000,000.

AN EVERYDAY REMEDY AGAINST INFLATION.

THE clipping of the coin of the realm was formerly regarded as a very heinous offence against the peace and welfare of society, and there were certain painful and disgraceful punishments attached to it. Nevertheless, it was nothing more than what might be termed individual inflation. If the clippings had been carried immediately to the mint and recoined, and Parliament had passed an act requiring everybody to receive a clipped coin in payment of a debt due him as though it were unclipped, then the process would have been very nearly parallel to our present schemes of inflation. Another form of clipping was indulged in on behalf of the Government by some kings and emperors whom we are now pleased to designate as selfish or short-sighted tyrants, instead of calling them liberal statesmen or advanced thinkers. This governmental process of clipping was known as debasing the coin. The clipper filed off two shillings from the pound, and passed, or endeavored to pass, the remaining eighteen as though they were twenty; the government substituted two shillings of alloy for two of gold, and passed, or endeavored to pass, the debased coin as a veritable pound. Debasement of the coin was nothing more nor less than inflation, with two trivial points of difference: first, that the debased coin did not bear a broken promise of redemption; second, that when the government came to redeem, it possessed the advantage of being able to ascertain how much gold there was in the piece, and of redeeming at its real and not at its fictitious value. The one class of financiers regarded clipping the coin as a good way to get money without its costing anybody in particular anything; the other class of financiers held that debasement was an excellent method for raising revenue without the unpopular burden of taxation or the dangerous vexation of a forced loan. But notwithstanding the ingenuity of these devices, there never was a time when a prudent man was willing to take or an honest man to give eighteen shillings for twenty. This fact both classes of financiers knew perfectly well, and their hope of making money easy rested on their ability to get the cheapened coin off their hands before its real value should be found out.

Mankind is just as desirous to have "money easy" as it ever was; and in our own country, where there is a feverish desire to get money for speculative purposes, caused alike by the extraordinary number of unworked fields of wealth, by the nervous, energetic, intelligent character of our people, and by the universal modern desire for sudden riches, it is not astonishing that we have many financiers, public and private, desirous of debasing and clipping our medium of circulation. Nor is it astonishing that these old processes should be wrought into a new form, and be called by a new name, and possess novel advantages in detail, such as "moving the crops" and "reviving business." But it is astonishing that a piece of work which was formerly reserved for tyrants or criminals, and which was always found to be grievously prejudicial to society, should now be accomplished, or sought to be accomplished, through the legislative representatives of society. The persons of any intelligence who clamor for this, know perfectly well that the period through which a debased coinage or an inflated currency will carry its supposititious value must be exceedingly brief, and never so brief in financial history as it would be now in our own country, after all the practical teaching our people have had of the ability of paper to run down. Doubtless, if we were to break away the dam that prudence and economy and retrenchment have partially erected, there would be a flood at which Messrs. Butler and Morton would clap their hands and cry aloud, "Is not water plenty? Are not the times lively? Behold what enlightened statesmanship can do in the way of spending to-day what we must suffer for to-morrow!" The majority of the persons who are "backing up" Messrs. Butler and Morton in the work of breaking down the dam, know perfectly well that the wasteful flood must be exceedingly short-lived, that the natural flow of the stream will not be augmented, and that a drouth must quickly succeed in which the majority of men will find themselves stranded. Nevertheless, each of the schemers thinks that his personal adroitness or luck will bear him to the end of the voyage, and enable him to land himself high upon the bank before the waters go down. The philosophy of these people is that of the counterfeiter who expects to "shove" his "queer" before its worthlessness is found out; and the philosophy of Messrs. Butler and Morton is that they for a few years to come can get up successive floods by breaking down successive dams, and, before the general irretrievable low-water-mark is reached, be able to land their boats upon some political eminence.

That the legislative representatives of an intelligent and industrious people should be relied upon to give legal effect to such a scheme is, as we have said, the astonishing fact in the case. It is also the dangerous fact. This danger might be deemed fanciful if it had not been found that, notwithstanding party pledges, we have to depend upon an executive veto to save us from just such legislation. The needy, adroit, unscrupulous, and speculative elements of our wealth-seeking society who want money to carry schemes, together with those whose success depends upon a nominal advance of prices, in order that they may thereby make a nominal payment of their debts, will want inflation just so long as they believe inflation can be made effective and compulsory by a mere act of Congress. Therefore, the question which all men who have accumulated property, or who hope to accumulate it by honest industry, must sooner or later ask themselves, is, whether Congress has an absolute constitutional power thus to unsettle values, and in effect take one man's money and give it to another.

By the first "legal-tender" decision, the Supreme Court, through five judges, declared that the power "to coin money" given by the Constitution to the Federal Government, was in effect restricted to the precious metals commonly in use throughout the world as a medium of exchange. By the second legal-tender decision the Supreme Court, by a like number of judges, declared that the legal-tender act is constitutional, and that Congress could not only make money out of valueless paper, but that this paper could have an *ex-post-facto* effect, and be used retroactively to discharge a debt contracted before the legal-tender act was passed or thought of. That is to say, the Supreme Court decided that Congress could make a law whereby a man who borrowed a dollar in gold before the legal-tender act, could pay it after the act with forty cents' worth of Government paper. If the Supreme Court could be again reconstituted by the appointment of new judges, it might be said that one of these decisions of five judges is an offset to the other, and that the whole question is properly open for judicial review; but as there is no reasonable likelihood of such a change in the Court, we must for practical purposes accept the latter as a final exposition of the power of Congress.

But here it must be understood that the latter decision did not go further than the precise point at which we have stopped. In the cases before the Court, a man had borrowed a dollar in gold, payable in the lawful money of the United States. The Court held that a paper dollar is lawful money of the United States when declared to be so by Congress, and hence that it fulfilled the express obligation of the contract. The Court has never held that where a man borrowed a dollar in gold, payable in gold, he can pay it in anything else. Happily this suggestion does not rest upon inference. The inflationists do not seem to understand that the Supreme Court has expressly decided that we have in this country two kinds of "lawful money," and that the American people are free to deal in whichever they please. Further than this, the Supreme Court has given a valuable practical effect to its decision by holding that, where the contract is made payable in one of these kinds of money—that is to say, in gold—the judgment in a suit upon such a contract must be rendered for gold, and the sheriff must satisfy the execution by paying the judgment creditor the full amount in gold. For such contracts, there is in contemplation of law no paper money in existence.

There is, therefore, in every man's hands a final remedy against inflation. All that is necessary to make this remedy effective is to make it operative. If any person can doubt this, he has only to glance at the Pacific communities, where the resolute will of

the people has kept paper out of circulation as completely as though it were forbidden by the Constitution of the United States. There are no inflationists there; for every man, no matter how much he may want money made easy, knows that a nominal dollar cannot be legislated into a real dollar, and that a real dollar cannot be liquidated by a nominal dollar, and that if he borrows the latter it will be worth no more to him than he can sell it for at a broker's. Inflation has no temporary advantages for him, and seems as childish a proceeding as for the Government to print TWO ($2) on the corners of a greenback, which says below, "The United States will pay *one* dollar to the bearer"; and then for everybody to take such notes and call them "twos," while they really estimate them as "ones." Parenthetically, we would suggest to Messrs. Butler and Morton that this would be a cheap method of inflation, by which the best currency in the world might be doubled or trebled in volume without the Government's being put to any extra present cost for paper, or to any ultimate loss when the time for redeeming comes around.

The error of capitalists, and indeed of the entire business community, has been that they were willing to speculate upon the supposed progress of contraction, and have so managed financial matters that every "time transaction" has been a bribe to the debtor to be for the time an inflationist. If New York, Philadelphia, and Boston were to agree that all loans and credits henceforth are to be in gold and for gold, a borrowing community like Indiana would speedily change front and be heard declaring that irredeemable Government notes are little better than their former "wild-cat" currency, and that the interests of the West demand that paper must be put up to gold. But so long as these people are left to believe that mere legislation can give them all the money they want, and that the lending, credit-giving part of the community will apathetically take paper in payment of debts, no matter how little it may be worth, just so long there will be active, earnest, dangerous inflationists. In the meanwhile, without waiting for a general agreement among business men, it is in every lender's power to do a great deal towards stamping out a danger which is constantly threatening and disturbing the whole country; and all that he has to do is to insist on the simple honesty of loaning and being repaid in a money which has some stable value, and does not fluctuate with the ignorance or unscrupulosity of Congress.

THE RAILROAD REFORMERS' MAIN QUESTION.

IN saying last week that the Senate Transportation Committee had failed to make known to the public its views of the "Postal-Car" controversy, we did an injustice, it seems, to the committee, for, though Congress did nothing about it at the last session, the committee did appoint a sub-committee, and their sub-committee made a report to the Senate, which on the 23d of June was recommitted and ordered to be printed. This sub-committee consisted of Mr. Mitchell of Oregon, formerly known as Mr. Hipple of Oregon, a gentleman who is quite rich in names, being said to belong to a class in society at the West of whom it is frequently asked on their arrival at a new place, "What was your name where you lived before?" and whose knowledge of the railroad question is said to have been derived from an intimate familiarity with the affairs of a certain corporation in the extreme Northwest, which has thus far proved a greater source of profit to the gentlemen who built it than to either the public or the private persons at home and abroad whose funds furnished the means. However, Mr. Mitchell, in his character of sub-committee, has thoroughly investigated not only the postal-car question but another and profounder one, and by means of the testimony taken, the arguments heard, and the discussions called out, his investigations have cast a flood of light upon the whole subject of railroad reform. Into the details of the postal-car controversy our readers would probably not care to plunge, but this report has important general bearings.

The railroad question, as we have often had occasion to observe, is a very complicated and intricate problem. It involves not merely the question of cost of construction, equipment, and transportation, but the relations of several distinct classes of persons directly interested. It is also closely connected with questions of taxation which are not very easy of solution. Nevertheless, it must have struck a good many people of a reflective turn of mind, that however complicated the railroad question may seem to them at the outset, it no sooner begins to be explored by Congressional or legislative committees than it assumes a charming and attractive simplicity. Under what clause of the Constitution of our State, or of the United States, as the case may be, have we the right, and does it become our duty, to seize and convert railroads to our own use? This is evidently the railroad reformer's main question. What is the actual cost of transportation; such paltry matters as the price of iron and coal, change of grade, width of gauge, do not interest him. Somebody else must grapple with these details. What he wants to know, and feels it to be his duty to know, is under what clause of the Constitution he can seize the roads. In the Western agitation for cheap freights, to begin with, the primary question to an ordinary mind seemed to be what the actual cost of transportation might be, and the ratio of profit to this expense; but the Grangers did not consider this a question of any importance whatever. The extortions of the roads they took for granted, and immediately proceeded to the elaboration of an argument, founded on the roads being "public highways," to show that any rates which the legislature might provide for them they must necessarily adopt, and, if they did not, the right and duty arose of seizing them for violating their charters. In the next step which the discussion took (when it was carried to Washington), the same process was gone through. The railroad question, it was said, was obviously one which could not be dealt with by the separate States, for the lines of railroad cross and recross State lines; there would be a continual and deplorable conflict of jurisdiction, which would end by leaving the question worse off, if possible, than it already was. Obviously, the only thing to do was for the General Government to undertake the roads. Here, too, one would have supposed that the first question to be settled was what abuses were to be reformed; but here, too, for the most part, the abuses were taken for granted, and the reformers proceeded to discuss the main issue: under what clause of the Constitution could Congress give and alienate the property of the roads? Obviously, under that giving to Congress the right to regulate commerce between the States. Commerce between the States was carried on by railroads; nothing could regulate it more than the rates of freight; therefore, Congress had the power to seize and run pretty much all the railroads in the United States.

It remained for Mr. Mitchell of Oregon, in his postal-car report, to give the most convincing proof of the generality of the tendency of railroad investigators to go to the bottom of the matter. The postal-car question, as everybody knows, is simply a question between the Government and the companies as to the rate of payment to be allowed for a particular kind of service. Formerly, the mails all went like ordinary freight, and so it was perfectly fair to compensate the roads by paying them by weight. Now, however, on the lines on which the postal-cars are used, the weight is no criterion of the expense, the chief cost to the company being the room occupied by the new railway post-office. It has always been admitted, too, by the Government that the old system was wrong, and laws on the subject have been twice passed. On the surface of the matter, the thing to be done seemed to be to ascertain what the rates fairly should be; the Government does not want to give up the postal-car system, and the railroads are perfectly willing to continue the service; the only question for Mr. Mitchell to consider seemed to be what arrangement, satisfactory to both parties, could be made. Mr. Mitchell, however, was far from entertaining any such narrow view of the nature of his functions. The very first task to which he addresses himself is to discuss whether, under the power "to establish post-offices and post-roads," Congress has the right, under any circumstances, first, "to take absolutely, without the consent either of the owner or of the State within

which such road may be, any railroad, its rolling-stock and equipments, within the United States, for the public use of the transportation over the same of the United States mails; second, to take the temporary use of any such road and equipments on like terms for a like purpose." And he decides, after a careful examination of authorities, that on paying just compensation Congress has this power, and may exercise it. We must do Mr. Mitchell the justice to say that his report also discusses the question at issue between the Government and the roads; but it is only after first settling the main question that he allows himself to proceed to those trivial questions of fact which he appears to have been appointed to investigate.

We noticed the fact last year that in the discussions carried on by the farmers as to "public highways," they were involving themselves in difficulties of a somewhat profound character, inasmuch as when they desired to avoid railroad-aid bonds, issued by towns in which they lived, they maintained that a railroad had not a public character; but whenever they desired to have their corn and wheat carried more cheaply for them, they maintained that the roads had not the character of private property—in this view of the law of corporations taking a ground directly opposite to that taken by the judges and courts, who have been supposed to know it, from the foundation of the Constitution. Since then this law, as expounded by railroad reformers, has received several important additions. We have established not only the principle that a railroad is not a piece of private property created and maintained for public ends, but a piece of public property diverted to private ends, but also the principle that any railroad may be reclaimed and converted to the use of the public in these three ways: under the power to "alter or amend" a charter, the State may fix rates at any limit it pleases, and thus make it impossible for the corporation to do anything but sell out to the highest bidder, on which the State may easily become the owner of the road on extremely "reasonable" and therefore "just" terms; second, under the right to "regulate commerce," Congress may do the same by any inter-State roads; and, third, under the power "to establish post-offices and post-roads," Congress may condemn and seize any road with which it is not able to come to an agreement on the postal-car question.

It may be that this new body of law which the railroad reformers are incorporating into the stale and antiquated system of jurisprudence handed down to us by our ancestors will prove a great blessing, but in view of the litigation between the companies and the State authorities going on in the West, it is important to call attention to the necessity of harmonizing the various divisions of the new code. For instance, there might be a conflict between State and Federal authorities, arising out of a laudable but simultaneous attempt to establish just rates on the part of the local and the General Government. The State having established by a board of railroad commissioners what it considers reasonable rates, and then having been forced by the non-compliance of the company to take away its charter, might find that the rates it subsequently established, as owner of the road, for carrying the mails did not seem just or reasonable to the United States, on which, under the right to "establish post-offices and post-roads," the Government of the United States might at once become the owner of the road and fix the rates for all transportation to please itself. Or, if we suppose that the Government has seized under this provision of the Constitution any line chartered by a State, does it become the owner of the road, subject to the right of the State to alter or amend the charter?—for if it does, what becomes of the right of the people locally affected to fix freights? Suppose a State proceeds against a road for forfeiture of its charter on account of not complying with the schedule of freights authorized by its railroad commissioners, and seizes the road, and it afterwards turns out that the schedule was not just or reasonable, can the railroad bring a suit in the United States Court to recover damages and its charter, or both, or is the State the final arbiter of what is just and reasonable under its right to alter or amend the charter? This point was not touched upon, we believe, in the Dartmouth College case, but it surely is important. Mr. Matthew Carpenter might employ his summer profitably in the consideration of it, as also the question what effect, if passed, the Civil-Rights Bill and the XIVth and XVth Amendments would have on these new branches of corporate law. There is clearly a great field for acute speculation here. Meanwhile, we are glad to see that a simple principle has been evoked and adopted by those who discuss the question, which does indeed contain an undoubted truth, but the importance of which we believe has never before in the history of railroads been so thoroughly grasped—and that is, the great maxim cited by Mr. Mitchell in his report with full and sincere approval in these words, that "there is nothing that the Government wants which it cannot take."

Correspondence

ORIGIN OF THE JOHN BROWN SONG.

To the Editor of the Nation:

Sir: I can vouch for the fact that some verses of the John Brown Song were familiar in the camp of the Second Massachusetts Infantry at West Roxbury before the Twelfth Regiment, afterwards organized at Fort Warren, Boston Harbor, came into existence, the first-named regiment being mustered May 11, and the latter June 26, 1861. The verses sung by our men were: "John Brown's body lies mouldering in the ground," "John Brown's knapsack is strapped upon his back," and "He's gone to be a soldier in the army of the Lord." Whether the two latter are among those of which Mr. Hall claims the authorship, I do not know. The first evidently antedates the existence of either regiment. The tune we always regarded as an old camp-meeting air, and certainly is the same to which in former years graceless bacchanalians were accustomed to chant their favorite ditty concerning the "old whiskey-bottle" which "stood empty on the shelf." In Mr. White's ears it may also have a "blackberrying" character, whatever meaning that epithet may have been intended to convey.—Very respectfully,

S. M. Quincy,
Late Captain Second Massachusetts Volunteers.

Boston, August 9, 1874.

Notes.

McPHERSON'S 'Handbook of Politics for 1874' (Washington: Solomons & Chapman) covers the two years ending July 15, 1874, and has unusual value as a record of political action, both State and National. The history of the salary-grab, all the financial measures of Congress, its coquetting with the transportation question, the supplementary civil-rights bill; the President's messages, orders, and proclamations, his dealings with the troubled States of Alabama, Arkansas, Louisiana, and Texas; proposed amendments to the Federal and State Constitutions; Geneva and San Juan awards; and a great variety of election and fiscal statistics, are presented in this compact volume, making it as indispensable as any of its predecessors.——A transcript of the classification and English-Latin terminology of the provisional nomenclature of diseases, drawn up by the Royal College of Physicians, London, and now officially adopted for the use of medical officers of the United States Marine Hospital Service, has been prepared by the supervising surgeon, Dr. John M. Woodworth, with the assistance of Dr. Frank W. Reilly, and just printed at Washington. It will undoubtedly be regarded by the medical profession at large as a very valuable and very convenient aid to the uniform statistical registration of diseases. The French, German, and Italian equivalents of the original are omitted from this transcript.——Roberts Bros.' fall announcements consist mainly of reprints of English publications—Hamerton's 'Etching and Etchers' and 'Sylvan Year'; Tyrwhitt's 'Our Sketching Club'; Mätzner's 'English Grammar'; Besant's 'French Humorists'; 'Madame Récamier's Correspondence'; 'Correspondence of Rev. Dr. Channing and Lucy Aiken'; Bates's 'Naturalist on the River Amazons'; Helps's 'Life of Thomas Brassey'; and a new Christmas story by Christina G. Rossetti. The American list includes one translation from the French (by S. R. Crocker), viz., George Sand's 'My Sister Jeannie'; and three juveniles, by Robert T. S. Lowell, "Susan Coolidge," and Mrs. Louise Chandler Moulton.——The Fifth Cincinnati Industrial Exposition will be opened September 2, and con-

tinue till October 4. The directors say of it that it will be the largest ever held in the United States, and the most representative of the country at large. We have also received notice of the Second International Exhibition of Chili, which will be opened at Santiago September 16, 1875. Intending exhibitors from this country should address the president of the Exhibition not later than the first of next December. All necessary information can be had of the Chilian consuls in our leading cities. Special premiums are announced as follows: $1,000 gold for the best style of narrow-gauge railroad and equipment; the same for the best system of measuring and distributing water for purposes of irrigation; $500 for the best exploring-drill adapted to mining operations.——H. O. Houghton & Co. have secured the contract for publishing the 'United States Official Postal-Guide' for five years. This is a guaranty of its being done well. The publication will be quarterly, beginning October 1.

—It may be helpful to those who have made private collections in the vast field of works illustrating the history of slavery and its abolition in this country, to learn that the completest one now accessible to the public is probably that in the library of Cornell University, the nucleus of which was deposited by the late Rev. S. J. May; and, so far as our information extends, it is the most deserving of future increase by similar accessions. We understand that Prof. Willard Fiske contemplates printing a condensed one-line catalogue of this department, for which, however, there are no special funds at his disposal. Contributions for this purpose would doubtless be very acceptable, and would serve the useful end of making known the richness and the deficiencies of the Cornell collection. Meantime, books and pamphlets of all sorts, and particularly files of the anti-slavery periodicals, bound or unbound, would be as thankfully received. There is an especial lack of the representative literature of the Pennsylvania abolitionists.

—President White of Cornell University reads on Wednesday, the 5th instant, before the National Educational Association at Detroit, an address on the American college system, which deserves attention, not so much for the conclusions which he reaches, as for the criticisms which he makes and the manner in which he makes them. We have, it seems, in the United States three hundred and sixty institutions bearing the name of "college" or "university"; but, according to Mr. White, "with very few exceptions, these colleges and universities are without anything approaching complete faculties, without libraries giving any idea of the present condition of knowledge, without illustrative collections for study, without laboratories for experiment, with next to no modern apparatus and instruments. This is true of the whole country, but it is more sadly true of those States outside the original thirteen." American colleges he declares emphatically to be mostly "a multitude of little sectarian schools with pompous names and poor equipment, each doing its best to prevent the establishment of any institution broader and better." A stranger arriving in one of our new university towns would be surprised to find, Mr. White says, the railroad station, the lunatic-asylum, the poor-house, and the county jail all better buildings, better heated, ventilated, and equipped than "the dormitories, recitation, and lecture-rooms where live and move the young men who are to make or mar the state." Going further, "he finds that the inmates of the asylums have good food well prepared; he finds the inmates of colleges generally supplied with poor food badly prepared; he finds young men of sedentary and scholarly pursuits living in families where vinegar and grease are combined by the worst cookery in the world to form a diet which would destroy the stomachs of woodchoppers." A comparison of these institutions with Oxford, Cambridge, the University of Berlin, or the Ecole Polytechnique, naturally results in favor of the latter, particularly when we consider the misdirected and foolish endowments to which ignorant private liberality is continually leading. Mr. White mentions one or two cases which he says are well known—the gift to "a weak denominational college" in one State of a powerful telescope which is unfortunately useless, owing to the fact that no one has given or made any provision for an observatory or an observer; in another case a "splendid geological collection," which is useless for analogous reasons; in another case, an herbarium, and in another, a mineralogical collection, which, there being no professor of botany to use the first, nor of mineralogy for the other, are also useless. This is a dark picture, but overdrawn. By leaving out of view the two most really successful universities in the United States, Harvard and Yale, Mr. White reaches the conclusion that our college system is a complete failure, and that the time has now come for a national university free from sectarian control; and severely censures those who are continually "groaning over and scolding at everything supposed to contravene ultra doctrines of non-interference and the ultra *laissez-faire* policy." His continual reference to the barrenness of the higher education in the "States *outside* the original thirteen" is rather misleading; for it is certainly in the States *inside* the original thirteen that we should expect to find, and do find, the best universities, and why we should forget that these are in existence we do not understand.

—Before the same association Dr. Edward H. Clarke, author of 'Sex in Education,' read a paper on the "building of a brain"; the question being the consideration of the means necessary for the production of the best brain consistent with the highest physical development of the race. The address contains nothing which those familiar with Dr. Clarke's views as to the education of the sexes will find very new, though it may be well enough to notice the fact (inasmuch as he is continually referred to as a rabid opponent of the higher education for women) that he declares himself of opinion that to carry on a proper investigation into the effect on education which "periodicity" ought to be allowed, "the community must be provided with a class of intelligent and well-educated female physicians." The lecture begins with this curious bit of speculation:

"No race of humankind has yet obtained a permanent foothold upon this continent. The Asiatics trace back their life in Asia so far that the distance between to-day and their recorded starting-point seems like a geologic epoch. The descendants of the Ptolemies still linger about the Nile. The race that peopled Northern Europe, when Greece and Rome were young, not only retains its ancient place and power, but makes itself felt and heard throughout the world. On this continent races have been born, and lived, and disappeared. Mounds at the West, vestiges in Florida, and traces elsewhere, proclaim at least two extinct races. The causes of their disappearance are undiscovered. We only know that they are gone. The Indian whom our ancestors confronted was losing his hold on the continent when the Mayflower anchored in Plymouth Bay, and is now rapidly disappearing also. It remains to be seen if the Anglo-Saxon race, which has ventured upon a continent that has proved the tomb of antecedent races, can be more fortunate than they in maintaining a permanent grasp upon this Western world. One thing, at least, is sure—it will fail, as previous races have failed, unless it can produce a physique and a brain capable of meeting successfully the demands that our climate and civilization make upon it."

Those who find their spirits affected by this gloomy view of the future of the great American people, may console themselves by reflecting that in Europe also there have been prehistoric races, while the disappearance of the Indian must be credited rather to the superior vitality, craft, and strength of the whites, particularly those connected with the Indian Bureau, than to any inherent deadliness of climate or of soil.

—In an address delivered on the 24th of June at New Haven, Dr. Woolsey gave an interesting history of the Yale Law School. The address is an admirable example of what such a paper ought to be at the present time, when there is an effort going on all over the country to purify and elevate not only the tone of colleges and universities but of professional schools as well. That the law schools have hitherto been regarded by all concerned rather as a training-ground for the pleading of causes, giving advice to clients, and the defence of criminals, is, as Dr. Woolsey intimates, only too true. But the opportunity has unquestionably come for awakening in the minds of students interests higher than these; for making such schools "the place of instruction in all sound learning relating to the foundations of justice, the history of law, the doctrine of government, to all those branches of knowledge which the most finished statesman and legislator ought to know." The multiplication of flourishing scientific and technological schools makes the following remarks on a subject which was discussed some time ago in the *Nation* highly valuable; they deserve wide reproduction:

"The sciences of nature have grown immensely in theoretical and practical importance during the last century, and for a long time to come it is probable this growth will be unobstructed. Our system here is such that all new discoveries, all new sciences, with their practical applications, must form a part of it, and an increasingly important part. Now, these sciences have to do with natural law only, and their applications affect the development of the material side of civilization. There is danger, therefore, that the balance between body and spirit, the natural and the moral world, will be disturbed, which would be a state of things fraught with danger to the best interests of man. For this reason, I desire to see all the sciences flourish side by side; the moral in their full power by the side of the natural in theirs. Only so can the best interests of society and of the individual man be promoted and a harmony be maintained in human culture."

—It must be very seldom that criticism produces so good a result as it has just wrought among the Oneida Community. Its efficacy we dare say may be due to the fact that the person subjected to examination was to the end unaware of his having been criticised at all, and that his critics had furthermore the exceptional advantage of being able to keep him under duress, and if necessary to employ coercion in the enforcement of their conclusions. Every week, as we understand it, the Oneida people meet together for a full and free discussion of each other's manifestations of character, and for hearing suggestions as to the amendment of each other's faults. If, for instance, D appears to C to be engrossing himself too much in worldly affairs, C so affirms in the assembly, and the matter becomes the subject of debate. So it goes throughout, and we do not hear of any ill consequences,

though it is not difficult to conceive of circles which it would take about one monthly meeting of this general description to rend asunder for years—perhaps for ever. At one of the late meetings of the Oneida critics the case was brought up of a lad designated as B. B has seen but ten summers, and it is hardly surprising to learn that among the traits which have been observed in him are selfishness, heedlessness, an inability to understand the nature of obedience, and a marked determination at all times to indulge his appetite for food with an entire disregard of ensuing consequences. But these native dispositions of boyhood have in the instance of this boy been developed to such excess that to the whole house his case appears one of genuine possession, and it was judged by the meeting that, though at times the boy was seemingly under a good influence and behaved as he ought, he still required the united prayers of the community and something more besides. Only two suggestions made at the meeting appear to have been thought important by the recorder. One was of so general, desultory, vague, and useless a character that it is easy to see that the true American criticism has an abiding-place in Oneida also; the brother making it thought that B might seek "to learn self-respect"; this being attained, the various points in B's affair, which it was the sole business of the meeting to discuss and settle, would fall into harmony. Brother N was less broad and more particular; he thought from things which he had noticed that what ailed B was that his alimentiveness was inordinate. He was a greedy eater. It was probable, then, that the devil controlling B was one of those of whom it is said that "this kind goeth not out but by prayer and fasting"; abstinence from food was therefore the regimen for B. The other members agreed with Brother N. From B personally nothing whatever is now heard; it is, however, asserted by Brother K that already he is much more docile—a result which may well be credited.

—We have been permitted to make the following extract from a private letter, addressed by Mr. Bonamy Price, Professor of Political Economy of Oxford, to an American friend who had sent him a copy of Mr. Schurz's speech on the currency—the second of those two remarkable efforts which did so much at the last session to delay and baffle the designs of the inflationists:

"I consider Mr. Carl Schurz's speech to be the ablest one ever made on banking in any parliament. Its range and its solidity are wonderful. The subject all the world knows to be most intricate, and to be singularly exposed to all kinds of arbitrary but very pretentious theory. Mr. Schurz has followed the only scientific method—rigorous analysis; and the result is a body of detailed doctrine which almost throughout will bear the test of the closest examination. I conceive that he has rendered a great service to his country as well as to political economy."

We are happy to be able to state that Professor Price is about to visit the United States, leaving England on the 20th of September.

—There seems to be no doubt left that Mr. James Greenwood, a London journalist and man of letters whose name is known on both sides of the water, has really destroyed his reputation in a very graceless manner. At first it was hoped that he might be able to extricate himself from his difficulty; the latest accounts, however, leave but little for the hope to go upon. The charge against him is his having either made out of whole cloth, or else vamped up from a newspaper article a generation old, a horrible story of a contest which, as he alleged, took place a few weeks ago at a place called Hanley, in Staffordshire. As he described it, this contest was a fight between a bull-dog on the one side and a half-witted dwarf on the other. Among the conditions of the fight was one to the effect that if the man should knock the dog senseless for sixty seconds victory should be considered as belonging to him, while if the dog on his part should "pin" the man so as to endanger his life and disable him from rescuing himself, victory should be the dog's, who, however, should in no case be allowed to make an end of his antagonist. Mr. Greenwood's story pictured the revolting appearance of the misshapen dwarf, the eagerness of the dog, the brutish bloodthirstiness of the spectators, the fierce onslaught of the combatants upon each other, and did it vividly and, to say the least of it, at all necessary length. He professed, however, to be horror-stricken at the sight of the ferocious details, and as long as his story was supposed to be a truthful one, there was assuredly no dearth of people, both gentlemen and ladies, to sympathize with him in this creditable feeling, and to say that it was no wonder that after half an hour of it he felt as if he should like to quit the room, could he have managed to do so. But since it has been more than suspected that his whole account was fabulous, some of his readers have rather doubted about this delicacy of his, and indeed have thought that in reality he was content to stay as close to the ropes as he could get, and probably to offer five shillings for a better place. To tell the truth, some of Mr. Greenwood's former writings are of a kind which, as the reader looks back at them in the light of this revelation, are seen to be entirely in keeping with the willing invention or utilization of this latest horror. We remember in one of his books descriptions of life among the remote islands of the South Sea which give a most ghastly illustration of the truth that the dark places of the earth are full of the habitations of cruelty. Compared to Mr. Greenwood's writing, other writings of the same general character as those of his which belong in the list we have in mind, are as the cruelty of an ordinary homicide is to the fiendishness of the boy Pomeroy. This is perhaps rather strong language; but if we may trust our memory it is not very much out of the way. The London paper in which Mr. Greenwood's article was published was the *Telegraph*, a sensational journal which has more than once been similarly victimized—if that term may be used to indicate its relations to the affair. We suppose it may be so used; but some of the *Telegraph's* rivals in London may probably have come to such a view slowly. The police and other local authorities of the village where Mr. Greenwood placed his arena, before long gave an indignant denial of the whole story, and so far Mr. Greenwood has failed to make it appear that he can find the house where the combat is said to have taken place, or can in any way strengthen his case as it stands. Meanwhile, it is reported that an occurrence such as he narrated did take place in or about Hanley many years ago, and that it got into print. It may be forgotten by some; but Mr. Greenwood is the reporter who years ago brought a leading London journal its first journalistic success, as we say on this side of the water, by spending a night in a London "casual ward," and writing out a very graphic narrative of his experience, bath and all.

—A writer in the *New Quarterly Review*, who evidently has had access to new facts about Lord Macaulay, makes an interesting if rather disappointing article about that author. Mr. Gladstone's quoted remark that the English public has an insatiable interest in everything belonging to Lord Macaulay probably strikes rather oddly on an American ear; but there is no doubt that anything about him new and really worth telling would be gladly heard in this country as well as in England. Mr. Matthew Arnold's much-approved German shopkeeper, who reads Macaulay's 'History of England' after the shutters are up, could, we think, be fairly matched in each individual case by an American of the shopkeeping variety—or, as we say, storekeeping variety. This we venture to assert without committing ourselves to any opinion at all in regard to the numbers in which the German shopkeeper, as above described, may exist. Mr. Arnold finds him very commonly; but although the world has been extremely German for the last two or three years, and the reaction has not yet set in, observers have nevertheless not been wanting who have found in the hands of the burghers nothing like so many 'Histories of England' as Mr. Arnold might lead one to suppose. There is no doubt, however, about the steadiness of his lordship's reasonable popularity among Americans. Our *Quarterly Review* writer has not in his repertory very much that is new, but among other things he brings to light a scrap of literary history which fits in neatly with a portion of the fabric already known to the public. It is in the shape of a copy of Lord Orrery's 'Letters on Swift's Life and Writings,' which, judging by the pencilled dates on the first page and the last, Macaulay read through on the 23d of July, 1835, and in the margins of which he wrote critical comments as he went along. Macaulay has not forgotten to remark with his customary softness and suavity on this sort of marginal notes, and "it is pretty to observe" how well their usual character is illustrated by these of his own now before us: On one page he writes "A most prodigious ass"; on another, "Really this book makes one ashamed of being a human being." Lord Orrery, writing about the voyage to the Houyhnhnms, says that it is a real insult to mankind, and Macaulay scribbles over against Orrery's remark, "This book is a real insult to mankind"; at the end of the first chapter, he comments "wretchedly written"; at the beginning of a letter in which Orrery addresses his son (Hamilton Boyle) as "Dear Ham," Macaulay writes: "One would think this was a letter from Noah"; "I am induced to believe," says Orrery: "What induced you?" says Macaulay; again, we have "Trash," "Folly," "Shame, shame." It may be worth while to cite this rather trivial array as making for the comfort of such readers as can recollect similar records of opinions of their own inditing, now irrecoverably scattered here and there up and down the world.

—Some of Macaulay's annotations are not of the kind above-quoted. Thus this one is suggestive: Orrery having said something about Swift and his position as a leader among the Tories, Macaulay says: "Orrery was very ill-informed. The minister would doubtless have been glad to do anything for Swift, but I am inclined to think that the place which Swift occupied in the Tory party, though far higher than that which Orrery assigns to him, was below that which he stated and perhaps fancied that he occupied." A useful part of the article is that in which some attempt is made to do justice to Macaulay's Indian career, which, "bumptiously" as it was managed and much as it has since been decried in all its parts, has here its merits insisted upon. Among these was certainly not the set of imaginary

cases which he drew up to illustrate his Code, and which is in many instances very funny. Several of the cases relate to practical joking, from which form of wit Macaulay is said to have often derived great suffering and furnished corresponding entertainment in his somewhat priggish youth. Mindful of these, the lawgiver, when he came to frame his system, devised or supposed various arrangements of circumstances in each of which A, the practical joker, pursues Z, the victim, but by-and-by discovers that

"These violent delights have violent ends."

Thus A, having assured Z that the dog which A then has in charge is an exceedingly savage dog, and will to a certainty mutilate or destroy Z in case Z continues to go along a certain path, if Z thus persuaded does not proceed on his way by that path, although he might have done so, the dog being really one of the mildest dogs in the world, it is held that A nevertheless wrongfully restrains Z. On two other finely imagined occasions it is held that A assaults Z, and altogether A is closely watched after.

WINCHELL ON THE DOCTRINE OF EVOLUTION.*

AMONG the numerous persons who have of late examined the doctrine of evolution is Prof. Alexander Winchell, of the University of Syracuse, and late the chancellor or presiding officer of that institution. Prof. Winchell was better prepared than most who have attacked the doctrine, by previous preparation in practical biology, having labored in descriptive geology and palæontology with tolerable success, and having also some knowledge of zoölogy and botany. Thus armed, he compiled and delivered "a couple of lectures before the Drew Theological Seminary, on the 10th and 15th of December, 1873," and these were subsequently embodied in the essay now under review. Prof. Winchell discusses "evolution" in a very systematic manner: First, "(A) evolution in the physical world," and, second, "(B) evolution in the organic world"; and, under the latter head, he considers the "facts of coexistence" and "facts of succession," thence infers that "an evolution of ideas exists," asks, "Is there a genetic evolution of organic types?" and examines at considerable length the facts bearing on the question; reviews the assertions made respecting "spontaneous generation," and concludes the systematic argument with a survey of the "theistic bearings of the doctrine of evolution." An appendix, however, is added, in which he gives and endorses the arguments of "Barrande *versus* Darwin."

"Evolution," says Prof. Winchell, "in the language of Spencer, is the transformation of the homogeneous, through successive differentiations, into the heterogeneous. *The type of the process is the development of the embryo within the egg*, but it is supposed to be exemplified in all progress, whether in the development of the earth, or of life upon the earth," etc. In other words, according to Spencer (and scientists generally), evolution is the expression of phenomena determined in progressive sequence, and whose factors are found in the pre-existent stages of such sequence. Yet, according to our author, "evolution is thus a mode of succession of phenomena—a law of sequence. It is not a force, but a plan, in accordance with which force acts. We may also say, it is the total result of the action of the evolving force." And he continues: "No one can recognize the steps of an evolution without recognizing the operation of some force acting upon matter and producing motion. Evolution, therefore, implies force. Hence the question which presents itself is twofold: 1. As to the *fact* of such a succession of phenomena as constitutes an evolution; 2. As to the nature and mode of action of the force causing evolution."

It will thus be seen that the idea of the existence of factors in previous conditions of the sequence is not, in Prof. Winchell's opinion, an integral element of the doctrine of evolution. According to his interpretation of evolution, he is an evolutionist; but he applies diametrically opposite modes of interpretation to the consideration of the facts relating to the inorganic and those relating to the organic creation. In the one case he concludes that "no determined opposition is likely to be manifested to the doctrine of evolution [in the usual sense] as applied to the physical world. At least, no such opposition is likely to come from well-read thinkers. It is within the domain of organic nature that the modern controversy chiefly exists" (p. 27). In the other case, "it is believed and generally admitted that no reflecting person can survey the phenomena of palæontological history without being impressed by the conviction that the succession of forms is in the main such as constitutes a method of evolution" (p. 36); but it is not the result of successive genetic relations. On the one hand, he insists on the elementary similarity of all inorganic matter and compounds, from the earth and its (inorganic) contents to an assumed cosmical vapor (pp. 21, 22). He exults in the range of variation of the heavenly bodies: "from the most attenuated vapor to the habitable earth, and even the frozen and fossilized moon," he remarks, "all possible stages and conditions of cooling are gradually held forth to view in the aspects which the mighty firmament presents to the eye of science" (p. 25). He dilates on the correspondence of the successive changes which each planet has undergone from youth to age with more etherealized bodies (p. 24), and on the identity of the primitive condition of each with a universal "star-dust," and he finds the factors of such evolution in physical forces. On the other hand, he explicitly, or by implication, admits the homological similarity or identity between species of the various groups of animals and plants; the range of variation in such groups, at one extreme, tending to specialization, and at the other to generalization, or greater likeness to older forms; the correspondence of the successive changes which each form undergoes, in its actual development from the egg to the adult condition, with more generalized forms; the correspondence (but with some limitations) of the earlier inhabitants of the earth with the earlier embryonic conditions of existing forms; the similarity of contiguous faunas, in time as well as in space; and the variability of species, and their capacity to deviate largely under certain conditions (the influence of man) from the typical form; but he finds it necessary to invoke constant divine interference in accordance with plan.

He not only admits the propositions to which we have referred, but exaggerates some of them to an absurd degree. Passing over his acceptance of "four categories of fundamental structure," and his remarks on them, the following passage meets us: "Every vertebrated animal resembles every other vertebrated animal in a hundredfold more particulars than enter into its resemblance to a molluscous or an articulated or a radiated animal. These vertebrates are all constructed on a particular plan, insomuch that, differ as they may—as widely as a fish from a bird—we find limb answering to limb, cranium to cranium, bone to bone, and, to a great extent, nerve to nerve, and muscle to muscle," and so on (p. 28). Professor Winchell's studies have indeed been of little value if we may measure his knowledge by such remarks; and with such evidences of want of conception of the nature of homologies and delusion respecting "plans" and "archetypes," we need not be surprised at his failure to appreciate the significance of morphological facts. The same misconception and ignorance prevail in his remarks on embryology, the "geological succession of organic types," etc. Thus, the antiquated errors that "the chick in the egg assumes in succession the aspect of a fish, a snake," etc.; that man "assumes in succession the aspect of a seal," etc. (p. 29), are repeated, and analogous errors are abundant. Only one, however, need be specified, and that only because of the strangeness of the logic and the diametrical contrariety of the inference to facts. "*The action of the physical influence is often, if not always, against the development of the organic modification which appears in correlation with it*," says Professor Winchell (the italics are his own), and, applying this proposition to the giraffe, he asserts that "it is not conceivable that physical forces should conduce to an organic modification which proceeds in a direction diametrically opposed to the direction of those forces. Now, no one can deny that the elongated forelegs of the giraffe stand in as intimate relation to its wants as its elongated neck or tongue. But the *physical* force acting upon the legs is the weight of the animal, which tends rather to shorten than to lengthen them" (p. 72)! But it is notorious that exercise calls into more active development the parts exercised, as the arms of the blacksmith, the legs of the dancer, etc.; and observation of his own or neighbors' children would have shown Professor Winchell that the legs of the new-born and crawling infant are much shorter, relatively to the trunk as well as to the arms, than in the erect youth or full-grown man, and that they grow with the demand for use; indeed, the increase in size of the posterior members is to such an extent co-ordinated with tendency to the vertical position that it has been even formulated into a generalization or "law" to that effect.

The confusion of ideas in the appreciation and arrangement of facts is evinced even in a simple "conspectus of theories of the origin of species." After a primary division into believers in "immediate creation" ("in single pairs," and "in colonies—Agassiz") and believers in "derivation (mediate creation)," he groups the latter in three primary subdivisions: in one ("through a force which is a mode of the Unknowable"), we have Herbert Spencer alone; in the second ("through external forces"), De Maillet, Darwin, Haeckel, Huxley, and Wallace are ranked; and in a third ("through an internal force, influenced by external conditions"), Lamarck, Hyatt, and Cope, Owen, Mivart, and Kölliker, are grouped. As a matter of fact, although several of the scientists referred to (*e.g.*, Lamarck and Cope) invoke the

* 'The Doctrine of Evolution: its Data, its Principles, its Speculations, and its Theistic Bearings. By Alexander Winchell, LL.D.' New York: Harper & Brothers. 1874.

'Trilobites. I. Résumé général de nos études sur l'évolution des Trilobites. II. Distribution verticale des Trilobites, dans le bassin silurien de la Bohême. III. Parallèle entre les Trilobites et les Céphalopodes siluriens de la Bohême. IV. Epreuve des théories paléontologiques par la réalité. Extrait du Supplément au Vol. I. du Système Silurien du centre de la Bohême. Par Joachim Barrande.' Chez l'auteur et éditeur. A Paris; à Prague. 1871.

active agency of appetency, or acquisition by endeavors, all acknowledge that the main cause of being and variation is "a force, which is a mode of the Unknowable," or, if it is preferred, a manifestation of the divine power, and differ chiefly in their estimate as to the origin of "new" forms, whether by insensible gradations or abruptly, and as to the extent to which characters persist or become transmitted and disseminated on account of the superior adaptation of such characters to the surrounding conditions, and their consequent survival when a "struggle for existence" arises. All even, practically, admit the operation of natural selection to a greater or less extent, for the biological aphorism that teleology (or structural adaptation) is, in comparison with morphology (or structure independent of function), a very unsafe guide in classification, involves the admission of the influence of natural selection in the long run.

While such errors in the appreciation of facts and their relations exist, errors of logic are evident in Prof. Winchell's presentation of objections. Thus, it is stated that "the great stubborn fact which every form of the theory encounters at the outset is that, notwithstanding variations, we are ignorant of a single instance of the derivation of one good species from another" (pp. 53–54), and reference is made to the persistence in time of certain forms, and the assertion ventured that "specific flexibility exists only within limits." A *petitio principii* in this case is involved, and the existence of species as a fixed category assumed. Thus, as long as two distinct forms exist between which no intermediate ones are known, those forms are called "species"; but as soon as intermediate forms are discovered, those previously called "species" (although still preserving the same characters in their extremes) are degraded to the rank of varieties, and as it is assumed that "species" are "created" as such, while "varieties" are simply modified descendants of the created specific types, the creationist bases his faith entirely on negative evidence. From the nature of his standpoint and assumptions, he is proof against any evidence, and accounts for everything by attributing to some species great uniformity, and to others excessive variability. He nevertheless practically admits that, except as to creation and natural birth, there is only a difference of degree between species and varieties. Those conversant with the history of science can recall countless examples illustrating this logical fallacy. And here reference may properly be made to the assertion that all domesticated races revert to their original "specific" type as soon as they become feral. The assertion is unfounded, the fact being that we are even unable to recognize in wild animals the originals of some of our domesticated forms; and in the diversity of the feral breeds of horses, cattle, etc., in the pampas of South America and the steppes of Asia, we have refutation of the trite error. It is quite true that in many cases characters peculiar to domestication are gradually eliminated, and for the very good reason that characters which may be objects of cultivation by man may be of no service, but the contrary, to the animals, and when his fostering care is withdrawn those characters will disappear. But complete reversion, in the cases of much modified types, is not attained.

Great emphasis is laid on the sterility of certain hybrids and comparative fertility of domesticated races among themselves (p. 54), the author, in common with most objectors, having overlooked the fact that the sterile hybrids in the cases chiefly invoked (*e.g.*, mules between horses and asses) are the offspring not of different species, but different genera. Again, there are differences in degree of fertility, and this towards both extremes—for if, on the one hand, distantly related species tend to barrenness, on the other hand, especially among plants, too closely related members of the same species also are disposed to become sterile, on the principle that "nature abhors close fertilization." But, in truth, all the clamor respecting hybridity is out of place, since our knowledge either way is as yet very slight, and hybrids between the most diverse species exist in a state of nature, as, for example, between different *generic* types of Cyprinoid fishes, as recognized by Siebold and other European naturalists, while, in our own country, we have a notable case of hybrids of every degree between two species of woodpecker (*Colaptes auratus* and *C. mexicanus*) at the confines of the ranges of the two. It is true, however, that such cases are exceptional, and the rule is that brutes prefer the society of their own kind—in which they very much resemble the human race.

A considerable portion of the volume is devoted to a summary and endorsement of an argument by M. Barrande against evolution. M. Barrande, as Prof. Winchell remarks, "is one of the most eminent of living geologists. Almost a lifetime has been devoted by him to the study of the Silurian rocks of Bohemia." By the most assiduous personal endeavors and a lavish outlay of money, he has collected vast material, which he has elaborated with considerable manual and literary skill, embodying the results of his studies in several large and finely illustrated volumes. His reputation as a careful and conscientious worker and detailer of facts of observation is irreproachable, but he does not enjoy an equal reputation as a systematist, and his work indeed too plainly evinces a want of systematic ability. Nevertheless, he has published an argument which has not only received the approbation of Prof. Winchell, but arrested Principal Dawson in his progress toward evolution, and converted him into a bitter antagonist. It is well, therefore, to ask what there is in his argument so striking and convincing.

M. Barrande essays to contrast palæontological theories with the reality ("Epreuve des théories paléontologiques par la réalité"). After a preliminary reference to the insufficiency of our knowledge of the ante-primordial era, he very reasonably postulates that the indispensable criterion of every law is that it should be in accordance with the facts; and then, admitting *Eozoon* as the first representative of animal life on the globe, and assuming that if the doctrine of evolution were true, we should have a graduated manifestation of life in the rocks, he proceeds to enquire if there is a concordance between the assumption and the reality. He examines the zoölogical composition of the primordial fauna; notes the absence of foraminifera and polyps in all the stages of that fauna; the absence of acephalous mollusks during the same period, and the contrast with the development of the brachiopods; the absence of heteropod mollusks up to one of the last stages of the period; the absence of cephalopods during the entire primordial epoch; the discordance between the numbers of trilobites in this fauna and (assumed) theoretical laws of animal evolution; and the absence of intermediate forms between the types represented in the primordial fauna; describes the zoölogical composition of the Cambrian (or next succeeding) fauna; and concludes with a contrast of what *he* thinks should be if evolution were a verity, and what are the facts according to his knowledge. His view of what should be if evolution were true is most remarkable, and would, it is safe to say, be repudiated with derision by every scientific evolutionist, and his arguments, so far as they are to the point, have been presented more forcibly by evolutionists, and especially by Prof. Huxley, in his articles on the persistence of types. It is of course entirely true, as M. Barrande says, that "the indispensable criterion of every law is that it should be in accordance with the facts," but if all the facts known are in such accordance that should suffice. M. Barrande's argument, however, (and that of his disciples) is based entirely on negative evidence. How unsatisfactory such evidence is a very slight acquaintance with palæontology will assure one. And the question is really, Which alternative is the more probable?—for there are practically only two prominent hypotheses of the origin of life on the globe. On the one hand, it is contended that all animals and plants were created with their actual characteristics, which should be invariable, so that, when changed conditions arose, they should succumb, to be succeeded by other created beings. On the other hand, it is asserted that all animals and plants are and have been the descendants, with more or less modifications, of pre-existent forms, and that they were endowed with a variability which should enable them, in certain of their descendants, to find their fitting place under all the natural conditions which the world in its changes might undergo. It is further urged (and more or less admitted by anti-evolutionists) that the various categories of subordination in the relations of animals, the embryological development of the individual, the geological succession of forms, the geographical distribution of animals, the correspondence of these series, the existence of rudimentary structures, the subordination of teleology to morphology, and the adaptation of the form to its surroundings, are such as would result from descent with modification; and the power of procreation, and the greater or less variability of the offspring, are the factors and efficient causes of evolution—and in these phenomena, the subject of daily observation, we have rational explanations of the facts of the relationship, development, and succession of organic life.

The problems of the origin of organic beings are, in fact, simply these: Have all forms primarily resulted from the miraculous combination of elemental atoms into living tissues; or, have they been born of previously existing forms? One or other *must* be the case, and any repudiation of direct creation and admission of derivation from a preceding form under any condition, is to that extent an admission of actual evolution. It is true, the breaks in the animal and plant series are numerous—extremely numerous—and of great extent; and, if evolution be true, the origin of life must extend back so far that the present known representation from the primordial to the present epoch can only be the smaller portion. But we have simply to ask ourselves, which is the more probable—that the phenomena so exactly (so far as they go) accordant with theoretical evolution are the result of periodical and miraculous combinations of "elemental atoms into living tissues," in accordance with a "plan" without evident purpose; or, that we have much to learn of former life, and that, for example, instead of knowing "more than fifty" (number of epochs, according to Agassiz)

times 250,000 (known living) animals, we only know about 100,000. One hypothesis (direct creation) is against every analogy of nature, against all experience and observation, and inconceivable in its nature; the other (evolution) is in accordance with every analogy of nature, the subject of daily observation, and perfectly comprehensible to our senses.

JOHN QUINCY ADAMS AT ST. PETERSBURG.*

THIS second volume of the diary of John Quincy Adams comprises in six hundred and sixty-two octavo pages his life at St. Petersburg, the Russian mediation, and the opening of the negotiations which put an end to the War of 1812. As in the first volume, the editor has confined himself to selection and occasional omissions, leaving the author, for the most part, free to tell his own story in his own way.

It is the story of a trained diplomat, conscious of the dignity and importance of his task, and guided in every part of it by a full sense of responsibility. We have already spoken of the literary character of the work. We can but repeat our first judgment. The style is diffuse and wanting in vigor. It has none of the vivacity and freshness of the best works of its class; has no happy touches of a master's pencil, and none of that mastery of characterization which imprints the peculiar traits of a distinguished man indelibly upon the memory. The best painting in the volume is the writer's unconscious painting of himself. Of the men and women with whom he is brought into contact we do not learn much. They come and go, but leave no strong impression. Yet there is a genuine faithfulness of portraiture, which gives a favorable impression of the writer. Though a skilful diplomatist, he manifests no fondness for the crooks and tangles of diplomacy, but seems rather like a clear-headed man, bent upon the performance of his duties and familiar with them in all their extent and bearings. It may well be doubted whether, with the exception of Henry Wheaton, the United States ever sent so thoroughly trained a public servant to a European court. We have already seen him at St. Petersburg as secretary to the unaccepted legation of Mr. Dana. None of the lessons of that first school were lost upon him. His journey back to Holland, through Sweden and Denmark, was equally useful. He acquired a knowledge of that part of Europe which few had the means of acquiring, and his early-formed habit of recording the acts and experiences of each day as it passed must have been invaluable to him as an observer and a negotiator. The most important work of the diplomatist is done, not in the cabinet with both parties on their guard, but in the drawing-room and at the dinner-table, in the by-play of a lively conversation, when the attention is thoroughly aroused and revelations drop unconsciously from unguarded lips. The want of men able to bear their part in this form of negotiation has been one of the great defects of our diplomacy. Mr. Adams was a thorough French scholar, and perfectly at home in a European salon.

The Russian mission began in August, 1809, and was entered upon with a deep sense of its importance. "At this commencement of an enterprise," says the first entry in the diary, "perhaps the most important of any that I have ever in the course of my life been engaged in, it becomes me to close the day by imploring the blessing of Providence upon it, that its result may prove beneficial to my country, prosperous to my family and myself, and advantageous to all who are concerned in the voyage." One of the most interesting parts of this volume is the passage from Boston to Cronstadt, beginning amidst the heats of August and ending amid the ice of a Russian October. What food did the active mind of Adams find to feed upon while cooped up seventy-five days in the crowded cabin of a merchantman of those days, when a ship of four hundred tons was considered large? Two previous voyages—four passages across the Atlantic—had secured him against sea-sickness; but most of his companions were compelled to pay the landsman's tribute. Meanwhile, Mr. Adams reads Massillon and Plutarch. Massillon he reads like an emeritus professor of rhetoric; Plutarch he comments, with no apparent doubt that the legends of Lycurgus and Solon are genuine history. He uses his pen also, and writes letters to his children. But his pen is heavy, and, though his advice is excellent, no one would be likely to read it more than once. At last land appears—the Orkney Islands, one of them seeming about two miles long, a bleak, lonely dwelling-place. It is war time, and English naval officers are in the full tide of their insolence. A little brig compelled their ship to try to send a boat on board, although the sea ran so high as to sweep it out of its course and almost swamp it. The next morning they make land on the coast of Norway, but new obstacles await them, amounting almost to adventures. The Danish flag is an unwelcome sight, the English still more so. There is a strict blockade of the coast of Zealand, and the English admiral enforces it rigidly. As a minister, Adams is entitled to pass. He goes on board the admiral's ship to urge his claim, which, after a good deal of higgling, is allowed. In the interview he takes note of a trait of English character. "Admiral Bertie," he says, "paid all due respect to the law of nations. He said nothing uncivil or offensive; but during the whole time we were with him *he never offered us a seat.*" Mr. Adams is at a loss to decide whether the slight was accidental or intentional.

St. Petersburg is reached at last. Ministers, like common travellers, must have houses, and the weary search begins. Dinners and balls and official receptions follow; and, mixed with the gossip which characterizes such scenes, is a cautious beginning of diplomacy. The new minister is feeling his way, studying his ground, preparing himself for the serious work of his mission. He touches the key-note of it skilfully in his first audience of the Emperor. We must remember that the country represented by a United States Minister in 1809 was not the country of a United States Minister of 1874. It was a republic, which was not in its favor. It had a very small army, a still smaller navy. It had been obliged to hire a common merchantman to convey its first minister to Russia to the place of his official residence. All Europe was represented there, and with a display of wealth, a profusion of expenditure, which threw the United States Minister into the shade. There was but one way by which he could hold his ground, and that was by superior intelligence and pecuniary independence. Fortunately for himself and for his country, Mr. Adams understood his position perfectly, both all that it required and all that it imposed. He lived with a dignified propriety which commanded respect, and, instead of aiming at a rivalry of equipages and entertainments for which he had not the means, he claimed and maintained among his colleagues a rank second to none for intelligence and official distinction. He was soon on a friendly footing with most of the members of the diplomatic corps, and with some on a familiar footing. His society was courted and his opinions listened to with respect. He was welcome everywhere. Still, he was not altogether satisfied with the irregular life he was compelled to lead, and his diary contains the record of his discontent:

"We rise seldom earlier than nine in the morning," he writes, "often not long before ten. Breakfast. Visits to receive, or visits to make, until three, soon after which the night comes on. At four we dine; and pass the evening either abroad until very late, or at our lodgings with company until ten or eleven o'clock. The night parties abroad seldom break up until four or five in the morning. It is a life of such irregularity and dissipation as I cannot and will not continue to lead."

Great things were going on in Europe during Mr. Adams's mission to Russia. Napoleon reached the summit of his power and fell. The war of 1812 between the United States and England began and ended. It was the duty of Mr. Adams to watch carefully every opportunity for furthering the interests of his own country. In his first audience of the Emperor he struck, as we have already said, the key-note of our relations to Russia—friendship on the basis of a liberal commerce; Count Romanzoff had taken the same ground.

"Je dois vous prévenir," he said, "que nous sommes ici de grands Anglomanes; that the prejudices in favor of England were founded upon old habits and long-established commercial intercourse; but that the English exclusive maritime pretensions and views of usurpation upon the rights of other nations made it essential to them, and especially to Russia, that some great commercial state should be supported as their rival; that the United States of America were such a state, and the highest interest of Russia was to support and favor them, as by their relative situation the two powers could never be in any manner dangerous to each other; that he had been many years inculcating this doctrine at this Court; that the Emperor had always manifested a favorable opinion of it, and he had had the satisfaction of perceiving the sentiments of his Imperial Majesty daily becoming more confirmed in this system."

If the English were loved in Russia, the French were hated; and this, also, the American Minister learnt from various sources, one of the most important of his informants being the former Minister of Sardinia, the Comte de Maistre, celebrated for his defence of Romanism in the 'Soirées de St. Pétersbourg,' and who, like his sovereign, was living on a Russian pension. "He is a Piedmontese by birth," says Adams with unwonted sprightliness; "a Frenchman by character, a man of sense and vivacity in conversation, and, as a victim of the French Revolution, keenly smarting under the present order of things. He says he shall die here, and he has, in fact, neither home nor country to which he can return." In one of Mr. Adams's conversations we find, in a new form, Napoleon's characterization of the Russian: "Grattez le Russe, vous y trouverez le Cossaque dessous"—"Scratch a Russian and you will find the Cossack under him":

"Some Frenchmen were speaking in high terms of [the Emperor] Paul's politeness and accomplished manners. Says Diderot: 'Vous êtes bien bons de croire à cela. Ouvrez la veste; vous verrez le poil'—'You are very simple to believe that; open his vest and you will find the hair.'"

* 'Memoirs of John Quincy Adams, comprising portions of his diary from 1795 to 1848. Edited by Charles Francis Adams.' Vol. II. Philadelphia: J. B. Lippincott & Co. 1874.

Here is a passage from a diplomatic dinner:

"The Count's dinner was very elegant, and his house is quite magnificent. I had conversation upon Spanish affairs and upon Homer with General Pardo; upon German literature and the German language with Count Einsiedel; and with Mr. Six upon the new monarchical constitution of Holland, which, he says, was principally made by himself; and upon the general situation and prospects of Europe."

But the American Minister was not always so lucky in his company. At a great dinner at the French Ambassador's, he "endeavored to amuse some of the tediousness of the day by conversation with some gentlemen of the company; but," he adds, "there are very few topics of conversation upon which I can talk with them. General Pardo, the Spanish Minister, has understanding, literature, and taste, and, withal, is perfectly accomplished in the science of cookery." We have alluded to Mr. Adams's fondness for pictures. He does not forget to note down in his diary that General Prado "had offered at Paris, for Charles the Fourth, King of Spain, three hundred and fifty thousand livres for a Death of Adonis, by Giorgione, the master of Titian, and could not get it; but that he did purchase, for one hundred and ten thousand livres, an original picture of Christopher Columbus, taken from the life by the same Giorgione."

But nowhere does Mr. Adams appear to more advantage than in his official conferences. His habits of mind were in a large degree controversial, and led him to connect his own statements by a simple but natural logic, without derogating from those of his opponent. His own ground he holds firmly but courteously, and, when the conference closes, you feel that all that the occasion warranted has been said. His thorough knowledge of his own country—then little known even to well-informed Europe—illustrated by an equally thorough knowledge of Europe, stood him on these occasions in good stead. He could talk with M. de Laval of the interests of the iron trade; he could enlighten Count Waranzoff as to the quality and abundance of American cotton and the real nature of American commerce. He could discuss international law with his colleagues, and always on an equal footing. It was his duty to make Russia feel the importance of American commerce, and if we go back to the condition of European commerce at that time we shall see that it was no easy task. Napoleon was at the height of his power, and still confident of closing the Continent to English manufactures. England was all-powerful on the ocean, and overbearing in proportion to her strength. Few as yet foresaw the marvellous change so near at hand. Meanwhile, the seeds of our own war of 1812 were ripening, and we needed sympathy if not actual aid. If Russia, at a critical juncture, used her kind offices with Denmark in our favor; if the emperor and his minister took every opportunity of expressing their interest in our prosperity, something of this good-will was owing to the good diplomacy of Mr. Adams. When war came, the sympathies of Russia, which were still with us, assumed a more definite form by an offer of mediation. England declined; but there was a moral weight in the offer which still made itself felt. The history of the "mediation" forms one of the most interesting chapters in this volume, and deserves to be thoughtfully studied. In it we meet another trained diplomatist—Albert Gallatin. Of the negotiation for peace, this volume gives us but the opening; it will form the subject of the next.

CHORLEY, PLANCHE, YOUNG, DICKENS, THACKERAY.*

THE second volume of the books for summer reading which go under the name of the "Bric-a-brac Series" has just appeared, and consists of "anecdote biographies," as Mr. Stoddard, the editor, calls them, of Thackeray and Dickens. Much more of the book is devoted to Thackeray than to Dickens—which for all reasons seems well. Freshness of interest is a thing worth seeking in volumes of the lightest and laziest of light literature; and Mr. Forster's biography so recently published, the profuse comments called out by it, and the disagreeable and disappointing light in which it sets the once idolized popular favorite, taken altogether have certainly dulled the edge of interest in Dickens, and in a great many cases have caused the interest to cease to be a pleasant and composing one. The public has in short recently heard a great deal of him, and has been surprised by finding much of what it has heard not such as it could like. With Thackeray the case is different. There is no life of him. He appears to have been from some cause or other strongly opposed to having any biography of him given to the public. We gather, indeed, from what is said here that he made it almost a dying wish that his family should, so far as they were able, prevent any publication of the kind. We may be the more pleased, then, at seeing collected together those fugitive memorials of him published scatteringly at the time of his death eleven years ago, and already much forgotten by the readers who saw them in one and another magazine. Furthermore, we may say that whatever we hear of him is pleasant, and, altogether, that to revive his memory in a couple of hundred brief pages is indeed a service to summer readers. Mr. Stoddard might have made these pages more and not been found guilty of the charge of favoritism as between Thackeray and Dickens, in spite of the scanty allowance of room accorded the latter. One source, by the bye, from which he might have taken materials he has expressly declined to approach. That is, Mr. James T. Fields's 'Yesterdays with Authors,' a work of which, as it seems to us, Mr. Stoddard's remarks might create too harsh an impression. Speaking of his own collection of Thackeray papers—the collection before us—he says:

"It contains at least everything that has come within my own observation, with the exception of a lively sketch in Mr. James T. Fields's 'Yesterdays with Authors,' which I cannot accept as a faithful portrait of Thackeray, although it may perhaps reflect one side of his nature with tolerable accuracy. The writer obtrudes himself too much, and his tone, if I am not mistaken, is one of condescension towards the robust-minded gentleman who honored him with his friendship."

We suppose there is no denying Mr. Fields's obtrusion of himself to a rather trying extent in every chapter of his 'Yesterdays,' no matter who the author under consideration may be. The chapter on Miss Mitford is the least offensive in this respect, but perhaps only because in that case the curse is partly taken off by the large number of Miss Mitford's good-natured, agreeable, sometimes absurd letters. In the other chapters it is beyond denying that there is plenty of obtrusion of the author's friend. But we suspect Mr. Stoddard's depreciatory expressions are in good part based on the fact that Mr. Fields, in giving his recollections of Thackeray, was not endowed with the grace to keep to himself such stories as that of Thackeray (on a certain public occasion) making faces, and thus nearly being the death of Mr. Fields, who could see him although the rest of the audience could not. It is quite credible that to such little monkey-shines, as the sailors call them, Thackeray was not averse. That Mr. Fields has so much to say of this fun-making and roystering side of Thackeray's character, and so little of the other, is probably due to the fact that to him more of that side than of the other was shown, and it probably is fair to relieve him from the charge of entertaining a condescending feeling towards the author of 'Vanity Fair.'

We see little that is new in this volume, and miss nothing or next to nothing, we believe, of what we have read in the way of tribute to our author's memory and recollections of his life and character. Mr. Stoddard we imagine to be too great an admirer of his subject not to have been a good gleaner. Some of his matter, however, has not had so good a chance as other portions of it to escape sudden oblivion. Such are the three articles copied from *Lippincott's Magazine*, including one of no small humor, entitled "A Friend of my Childhood." This, we believe, is by a son of Mr. William B. Reed, of Philadelphia, a gentleman with whom Thackeray was on warm terms of friendship. "A Friend of my Childhood" thus begins:

"I suppose I must have pulled the bell very hard that day, for otherwise I don't think she would have kept me waiting twenty minutes, as she did. *She* was only my mother's servant-woman, whose duty was to wait upon the dinner-table and the door, the latter function being the more onerous one. Looking back at my conduct over the lapse of eighteen years, I am disposed to acknowledge that she was right in the abstract in punishing the inconsiderate impatience which made me keep the door-bell upon a continuous ring till I was let in. But how wrong did the event prove her! Scarcely was I warmed up to my work, when, turning my head, I saw a tall gentleman with broad shoulders and a round face, whose look, at first one of enquiry, and perhaps bewilderment as he tried to distinguish the house he was in search of from among a dozen, all characterized by that unity of design which in Philadelphia strikes forcibly the intelligent foreigner, suddenly changed to one of amusement, not, I thought then, unmixed with approval, as he caught sight of me at my reprehensible employment. And as I rang with a persistency which nothing can now call from me, he stood on the bottom step (for it was my mother whom he had come to see) with that expression in which I found so little discouragement."

This gentleman was Mr. Thackeray, and his acquaintance with the bell-ringer soon ripened into a good deal of intimacy.

Of the sort of writing such as is here collected, that which is produced on occasion of the death of distinguished men of some letters, is usually produced by friends and acquaintances and some by other men of letters, of more or less distinction. The fault of the first class of momentary biographers and eulogists is the venial one of warm and indiscriminate praise. That of the other—and both faults are exemplified here—is of making a professed critical estimate of the distinguished man's character and genius, an estimate which is largely a vehicle for vague language in which the author glorifies his subject and incidentally himself, and has little to say that is really accurate or worth saying. Thus, to illustrate with extreme brevity: a gentleman engaged in making reminiscences for Dickens's honor and glory and his own satisfaction and complacency will utter a manly sentiment or two, and then

* 'Bric-a-bac Series. I. Personal Reminiscences of Chorley, Planché, and Young. II. Anecdote Biographies of Thackeray and Dickens. Edited by Richard Henry Stoddard.' New York: Scribner, Armstrong & Co. 1874.

ask the reader to pause for a moment and think of the effect which it must have had upon the invalid Lady Jane to hear the noble tones of Dickens as he cheerily entered her sick-room. Whereas, according to another cited witness, if the truth was known, a mark of Dickens's speech was that he talked as if his tongue was slightly too large for his mouth. As the sort of wordy, unsubstantial, and we fear half-heartless eulogy of which we speak is still practised on due occasion by an active school of writers in England, it is worth while to recall recollections of the exuberant, high-flown way in which various kinds of people have talked of the unflagging delightfulness of Dickens, for example, in his intercourse with his daily companions, and then to contrast these recollections which we owe to incompetents and enthusiasts with the testimony of an eye-witness. In the animal spirits demanding horse-play for their expression, and in the dulness of the exhaustless humor, we seem to ourselves to get a glimpse of truth for which we suspect we should wait long and in vain from the pens of the Salas and Theodore Taylors and Blanchard Jerrolds. The narrator is a young lady, a violent admirer of "Boz," whom she met at Broadstairs:

"We then strolled farther down to watch by the fading light the tide come rippling in. The night grew darker, starless, and moonless; the only light being a lingering, lurid gleam, which touched the crest of the waves with a phosphorescent glimmer. Dickens seemed suddenly to be possessed with a demon for mischief; he threw his arm around me and ran me down the inclined plane to the end of the jetty till we reached the tall post. He put his other arm round this, and exclaimed in theatrical tones that he intended to hold me there till 'the sad sea waves' should submerge us.

"'Think of the sensation we shall create! Think of the road to celebrity which you are about to tread! No, not exactly to *tread*, but to flounder into!'

"Here I implored him to let me go, and struggled hard to release myself.

"'Let your mind dwell on the column in the *Times* wherein will be vividly described the pathetic fate of the lovely E. P., drowned by Dickens in a fit of dementia! Don't struggle, poor little bird; you are powerless in the claws of such a kite as this child!'

"By this time the gleam of light had faded out, and the water close to us looked uncomfortably black. The tide was coming up rapidly and surged over my feet. I gave a loud shriek and tried to bring him back to common sense by reminding him that 'My dress, my best dress, my *only* silk dress, would be ruined.' Even this climax did not soften him; he still went on with the serio-comic nonsense, shaking with laughter all the time, and panting with his struggles to hold me. . . .

"'Dress!' cried Dickens, with withering scorn. 'Talk not to me of *dress!* When the pall of night is enshrouding us in Cimmerian darkness, when we already stand on the brink of the great mystery, shall our thoughts be of fleshly vanities? Am I not immolating a brand-new pair of patent leathers still unpaid for? Perish such low-born thoughts! In this hour of abandonment to the voice of destiny, shall we be held back by the puerilities of silken raiment? Shall leather or prunella (whatever that may be) stop the bolt of Fate?' with a sudden parenthetical sinking from bombast to familiar accents, and back again."

The first volume of the "Bric-a-brac Series" is, if anything, more agreeable reading than the second. It is made up of extracts from the recently-published personal reminiscences of Henry Chorley, the well-known musical critic; J. R. Planché, the playwright and manager; and Julian Young, son of the celebrated actor. Mr. Stoddard, we see, has so contrived it that each of his reminiscents throws some light on the other; several of the people mentioned by one of them coming in also for mention by another, and the one taking one view of them, the other another. Thus Rogers, the poet, was an acquaintance of Mr. Planché's, who liked him, and in a way was an acquaintance of Mr. Chorley's, who may have liked him. For instance, he thus speaks of the old gentleman: "Few old men have ever shown a more mortifying behavior to a young one than Mr. Rogers from the first to the last displayed towards me," and it appears that almost from the first to the last "the banker-poet," whether at the concert, in the opera-box, at the dinner-table, or wherever the two might be, in a voice loud enough to be heard, would set on foot a conversation such as this:

"*Rogers:* 'Who is that young man with the red hair?'
"*X:* 'Mr. Chorley,' etc., etc.
"*Rogers:* 'Never heard of him before.'"

Again Mr. Chorley says:

"I have always considered myself the person to whom Rogers made his most gratuitously ill-natured speech, as under. It was at the *Antient Concerts*, on a night when the room was crowded, owing to a royal visit, and when every seat was occupied. Mine was at the end of a bench, by the side of the Dowager Lady Essex (Miss Stephens that had been). She was one of Rogers's prime favorites; even though she is in private as in public one of those gracious and gentle women against whom no exception can be taken. He loved to sit next her, and pay her those elegant and courteous compliments, the art of paying which is lost. When I saw the old gentleman creeping down the side avenue betwixt the benches, at a loss for a seat, I said, 'Now I shall give up my place to Mr. Rogers; good-night.' While I was stooping for my hat: 'Come,' said she, in her cordial way, 'come, Mr. Rogers, here is a seat for you by me.' 'Thank you,' said the civil old gentleman, fixing his dead eyes on me, as I was doing my best to get out of the way; 'thank you; *but I don't like your company.*'"

In Mr. Planché's recollections he speaks of Rogers as long known to him and as having never within his knowledge said an ill-natured thing of any one. But he himself by no means denied the accusation. "When I was young," he observed, "I used to say good-natured things and nobody listened to me. Now that I am old I say ill-natured things and everybody listens to me"—a simple philosophy, at all events, of social life and its duties. We do not know if it is new with Mr. Planché, but a better story than any here told, either of Rogers's wit or his ill-nature, is that of an incident which fell under his notice once in Paris:

"My old friend Maltby, the brother of the Bishop, was a very absent man. One day at Paris, in the Louvre, we were looking at the pictures, when a lady entered who spoke to me and kept me some minutes in conversation. On rejoining Maltby I said, 'That was Mrs. ——. We have not met so long she had almost forgotten me, and asked me if my name was Rogers.' Maltby, still looking at the pictures, said, 'And was it?'"

As to the taking character of these handsome little volumes the reader can make a guess at it by looking at the names which figure in the anecdotes. These are some of them: Edwin Forrest, Landor, Moscheles, Sydney Smith, Mr. Grote, whom Mr. Chorley thought one of the four finest gentlemen he had ever seen, Theodore Hook, Byron, De Vigny, Rachel, Miss Landon, Lablache, Sheridan Knowles, Madame Vestris, Sir William Molesworth, Hawthorne, Edmund Kean, J. W. Croker, Wordsworth, Bowles, and half a hundred more of literary or social mark and distinction. We might add that, although one might suspect it, these anecdotes are not commonly of the regulation kind. The men who relate them or make them are persons quite capable of taking their own views of persons and things.

Horæ Hellenicæ: Essays and Discussions on some Important Points of Greek Philology and Antiquity. By John Stuart Blackie, F.R.S.E., etc. (London and New York: Macmillan & Co. 1874.)—Professor Blackie is well-known as a philologist of the older English school. He would probably not accept this classification of himself, for he speaks disparagingly of English scholarship in some of these essays; yet the essays themselves reveal the peculiarities of method and limitations of judgment that characterize the school to which we have referred him. He is a man of extensive reading and of strong convictions, and expresses himself with a liveliness and vigor which do not increase one's confidence in the scientific value of his statements. His 'Four Phases of Morals,' as well as some of these essays, shows how his studies of antiquity are interpenetrated by an interest in moral questions, and illustrates fairly his strength and his weakness. Similar faults of style appear here as there, as in the needless use of such words as "subsume," "self-exenteration," and "I most potently believe."

The present volume is a collection of essays which were written at various times and have been published in various places. In justice to himself, the author should have given with every essay the date of its original publication, for a reader's judgment of particular points is often influenced by that knowledge. For instance, the essay on the Prometheus of Æschylus seems from internal evidence to have been written before 1850, but if one did not notice this he would reasonably censure the author for omitting to consider such books as Kuhn's 'Herabkunft des Feuers' and Klein's 'Geschichte des Gr. Dramas,' not to speak of Preller's 'Griechische Mythologie.' Still, the essay on mythology, which is recent enough to refer to Max Müller's 'Chips,' gives no indication of knowledge of Preller's handbook. The Prometheus essay gives an interesting review of the controversy about that sublime tragedy; but we doubt whether any scholar has been inclined to accept Professor Blackie's view as a solution of the difficulty. He ascribes to Hesiod an influence upon the Athenian mind which can hardly be proved or rightly assumed for that rather sordid-minded old Bœotian. The theology of Hesiod as well as his morality is as much open to criticism as that of Homer, and we think more so, from a modern standpoint, and it does not appear why Professor Blackie makes him so valid an authority for the belief of the Greeks in the time of Æschylus, after distinguishing so clearly in the previous essay between the theology of Homer and that of the tragedians.

Two of the essays are attacks upon views advanced in Grote's 'History.' The one on the character of the Sophists is a fair though not an exhaustive discussion of a difficult question, which involves a judgment of moral influences where the materials are from partisan sources and somewhat scanty; the other essay, an attempt to establish the historic truth of the tradition that ascribes a division of land to Lycurgus, is of little or no value, because it does not fairly present Grote's argument. It makes no mention of his strongest point, that down to the time of Plutarch there is no authority for

the tradition, while the nearest contemporary authorities (*e.g.*, Alcæus, Hellanicus, Herodotus) are inconsistent with it.

It is manifest, from the preface as well as from the style of the essays, that the book is designed for scholars, and is therefore reasonably to be estimated as a contribution to exact scholarship in Greek philology. In this point of view it will not be found to have permanent value. The author's method is too superficial; he is too easily contented with expressing his own opinion and stating only the arguments that favor it, and too lively in his contempt for a differing opinion, to inspire confidence in those who read critically and do not depend upon him for their knowledge of the subject. His principles of scholarship, too, show the same narrowness of view and positiveness that he seems himself to condemn in English scholars generally. He has little in common with the Germans, whom he accuses of preferring "what is remote to what is obvious, what is conceptional to what is sensational, what is fanciful to what is real, what is mystical to what is plain." In the essays on "English Hexameters" and on the "Place and Power of Accent in Language," while we agree with his general conclusions, especially as to the pronunciation of Greek according to the written accent, we are constantly as we read protesting against his reasonings. His four "grand principles of the general doctrine of accents," significance, euphony, variety, and convenience, really explain nothing, and rest upon nothing. They do not explain why the speakers of Greek never accented a syllable before the antepenult, nor why the speakers of Latin accented a long penult. They have no foundation in any ancient writer, nor in the facts of language, except as viewed by individual taste or opinion. When one recalls to mind the late Professor Hadley's essay on accent, it does not seem as if the two men could have lived in the same century.

Professor Blackie's treatment of the "Theology of Homer" shows the same insular method in its inadequate presentation of the subject. Though he refers several times to Nägelsbach, he does not seem to have mastered clearly his central thought, which is a solvent of most of the difficulties of the subject, that the whole representation is an effort, involving the necessary inconsistencies of such an effort, to imagine a world of immortal beings with the conditions of this earthly world so far modified as they probably would be by that immortality. The distinction which Professor Blackie draws between Hellenic (it should rather be Homeric) and Christian humility —that the former rests on the sense of dependence, the latter primarily on the sense of guilt—seems true so far as it goes, but not so fruitful in inference and illustration as this, that the former has for its object the gods only; the latter, both God and man. Professor Blackie rejects Ihne's distinction between the representations as to the gods in the Iliad and those in the Odyssey on very insufficient grounds. We do not insist that he should accept it, though it seems to us, as to many others, well-founded; but we do insist that in thus publicly attacking a widely accepted view, he should consider the passages fully and give something more than a mere assertion of opinion.

The essay on the modern Greek dialect is on the whole the most valuable one in the book, because it contains a good deal of matter that cannot be found elsewhere, at least in English, and in so compact a form. But it too is marked throughout by erroneous views or careless expressions that detract greatly from its value. Thus, on p. 134 the writer speaks of a present active infinitive in modern Greek without the final letter, and of a first aorist passive infinitive without the final syllable, of the ancient forms; and then on p. 147 deplores at length the entire loss of the infinitive mode. But if those forms are infinitives in meaning and use, the mode is not lost; if the mode is lost (which is the fact), those forms ought not to be called infinitives or derived from the ancient forms. Again, on p. 146 there is an illustration which might be thought by sentimentalists to be of as doubtful truth as the statement illustrated would be by scholars. "It may be said with perfect truth that the dropping of the optative is in the end an improvement rather than a corruption of the language; as it is better that a person should be dead altogether than that, being alive, his occasional presence should serve only to remind us with the more acute pain of his habitual absence." The author overestimates, as we think the late President Felton did, the purity of the modern spoken Greek measured by the Attic standard. No one who observes carefully in families and in the streets of Athens or elsewhere in the country, will find that "the best type of the Greek actually now spoken in Greece is contained in the newspapers destined for general circulation." The Greeks themselves admit that their principal newspapers, as well as the university lectures and public addresses, are in a style beyond the understanding of the mass of the people. There are a few less-known papers in the popular dialect, but their language differs so far from the form discussed in this essay that they would be utterly unintelligible to one who depended upon it as a guide.

The book is handsomely and in general accurately printed, but for another edition the Greek should be more carefully corrected, and such misprints in the English as Hyphæstion and Klepths, Klepthic (which last go all through one essay) ought not to be overlooked in a book of scholarly discussion.

Shakespeare-Lexicon. A Complete Dictionary of all the English words, phrases, and constructions in the works of the Poet. By Dr. Alexander Schmidt. Vol. I. A–L; pp. 678. (Berlin: George Reimer; New York: F. W. Christern.)—Unlike Mätzner, whose masterly English Grammar has had to be translated into the language of which it treats, Dr. Schmidt discards German except in the preface to his truly monumental work. Purely practical considerations, he says, determined his choice in this matter; and chief of these, we may suppose, was the certainty that a Shakspere Dictionary would find its largest pecuniary support among English-speaking peoples. But doubtless, too, we have here another symptom of the growing conviction that English is to be the dominant language of the future, and that already the time has come to employ it as an original means of communication with the learned of all nations, or of acquiring a lasting and world-wide reputation. In any event, English readers must congratulate themselves upon Dr. Schmidt's decision, which, from the scholarly point of view, can hardly be deemed less than courageous in a foreigner; and, owing to the fact that the work was printed and published, as well as compiled, in Germany, there is additional cause for congratulation in its cheapness—five dollars a volume being the importer's price.

The first question which the compiler had to ask himself was, What, for the purposes of my dictionary, is "Shakspere"? Dr. Schmidt recognizes as genuine (*ächt-shakespearisch*) the works which have been commonly printed together as Shakspere's, namely, the thirty-six plays of both the first folios, together with "Pericles" and the so-called Poems. The apocryphal pieces of the later folios, and the stage directions throughout, he disregards. As for the various readings of the folios and quartos, he gives them all excepting such as occur in the spurious quartos, and he follows the Cambridge editors in adopting the modern orthography unless a difference in the sense is denoted by the older spelling. The scientific order which is nowadays observed in the etymology of dictionaries of the first class has seemed to Dr. Schmidt out of place in dealing with a limited period in the development of a language; and he has accordingly given to his definitions a natural rather than an historical arrangement. Obscurities which had their origin in the poet's train of thought (*Gedankengange*) are left, without contention, to the commentators. Words of constant recurrence are not indicated for every passage in which they are to be found, but the rarer words are completely indexed, and in practice the 'Shakespeare-Lexicon' will, we believe, be found nearly or quite as serviceable (if not quite so convenient) for reference as Mrs. Clarke's 'Concordance.' The space gained in the 'Lexicon' by substituting (say under *Letter*) 44 references for about 340 in the 'Concordance,' is returned with interest in the case of words like *a* (*an*), *do*, and *come* (five columns each), and *from* (more than three columns). A clear advantage over the 'Concordance' lies in the arrangement of references and quotations not under the several plays in which they occur, but under similar meanings. For example, the parallel passages cited under *Level* (subst. 2) remove all ambiguity from the line in 'Winter's Tale,' ii. 3, 6:

"My life stands in the *level* of your dreams."

Dr. Schmidt gives the line of the play (or poem) as well as the act and scene; Mrs. Clarke only the latter. But we need not push this comparison further, since its use as a concordance is secondary to the main object of the 'Lexicon,' which is to help to a better understanding of Shakspere and to infuse more method into the criticism of his text. We might point also to the grammatical features of the 'Lexicon,' but they too are subordinate. A Shakspere grammar was, indeed, part of the compiler's original plan, but he was abundantly anticipated by Mr. Abbott in his well-known work, and by Mr. Sidney Walker ('Critical Examination of the Text of Shakspere'). A few grammatical remarks are reserved for the appendix to the second volume, in which will also be collected the foreign and dialectic words used by Shakspere.

The typography of this 'Lexicon' is deserving of all praise, and the economy of room by abbreviation and punctuation such as only Germans know how to attain with clearness. We cannot do better than quote a specimen article entire:

Footing 1) s t e p, t r e a d: *the earth, in love with thee, thy f. trips,* Ven. 722. *I hear the f. of a man,* Merch. V, 24. *the wooden dialogue and sound 'twixt his stretched f. and the scaffoldage,* Troil. I, 3, 156. *to set* f. =a) to arrive, to step on, to touch: *set no f. on this unkind shore,* H6B III, 2, 87. *when she set f. here,* H8 III, 1, 183. b) to get a firm position, to gain ground: *who strongly hath set f. in this land,* R2 II, 2, 48. *when Talbot hath*

III, 2, 77.

5) footprint: *dance on the sands, and yet no f. seen*, Ven. 148.

RECENT GOVERNMENT PUBLICATIONS.

Senate Executive Document, No. 45. Message from the President of the United States, transmitting a Communication from the Secretary of State, and the report by which it is accompanied, upon Samoa, or the Navigator's Islands.

In March, 1873, the State Department commissioned Mr. A. B. Steinberger to visit the Samoan or Navigator's Islands, with a view of determining their character and the advantages likely to result to the United States from closer commercial and other relationships; and the present document is the result of his enquiries. It contains much valuable information concerning the condition of the natives, and the animal, vegetable, and mineral products of the islands, as well as their agricultural and industrial resources. Large collections of the animal and vegetable life of the islands were brought back by Mr. Steinberger, as well as various objects of ethnological interest.

Mr. Steinberger declares that he has obtained a living specimen of the dodo, which he preserved in alcohol after its death on the journey home, and presented to the National Museum. He is, however, quite in error, as the species referred to is the dodo pigeon, a bird collected on Captain Wilkes's expedition, and described by Mr. Peale as *Didunculus strigorostris*, the type being now contained in the National Museum. Although very rare, this bird occasionally finds its way to European museums; the true dodo (*Didus ineptus*) was an inhabitant of the Mauritius, but appears to have been extinct for several centuries. It was of huge size, and at one time was supposed to belong to the family of the vultures. But the discovery of the *Didunculus* first suggested its relationship, and it has latterly been considered as belonging rather to the pigeons than to any other family.

Forty-third Congress, First Session. House of Representatives. Executive Document No. 193. Reconnoissance in the Ute Country. Letter from the Secretary of War, transmitting a Report and Map of a Reconnoissance in the Ute Country made in 1873 by Lieut. E. H. Ruffner, of the Corps of Engineers. Presented March 19, 1874. Referred to the Committee on Military Affairs and ordered to be printed. 8vo, pp. 102.

The origin of this reconnoissance was due to the disturbance of the relations between the Ute Indians and the miners of the so-called San Juan District, reported as embracing the claims located on the Animas River and on the Lake Fork of the Grand River. These districts, formerly opened and abandoned, had become the centres of wild speculation, and prospectors were said to be rushing in from all quarters. This, of course, was extremely distasteful to the Ute Indians, who occupied a consolidated reservation, including one part of the field and possibly all, and they earnestly protested against it. An attempt to secure a cession of the territory from them in 1872 was a failure, and the prospect of a collision between the two parties in 1873 became so great, involving the danger of war with a powerful tribe, that orders were issued to the military authorities to keep the miners out of the limits of the reservation, if necessary by force. To do this it was essential to define with accuracy the boundaries of the reservation, the eastern border of which was constituted by the 107th meridian. The difficulty, and perhaps danger, of running an instrumental line was fully appreciated, and Lieut. Ruffner was detailed to accomplish the work. Before the survey was begun, however, a new treaty was made with the Indians, by which they relinquished the area desired, and the survey was conducted without the necessity of marking with the same precision the boundary line referred to—a line 525 miles long, passing over five high mountain-passes. The country was meantime explored pretty thoroughly, and the various approaches to it from the Arkansas were marked out, of which detailed accounts are given in the report. As is customary with Government expeditions, the party was accompanied by several civilian specialists. In the general report, with the sub-reports from the various assistants, we have much valuable information in regard to a region comparatively unexplored.

THE WEEK IN TRADE AND FINANCE.

NEW YORK, August 10.

THE money market has remained quiet throughout the week at 2 to 2½ per cent. on call loans. Time loans are quoted as follows: sixty days, 4 per cent.; four months, 6 per cent., and 7 per cent. for loans running till the end of the year.

The Bank of England raised its minimum rate of discount on Thursday from 3 to 4 per cent. The bank lost £938,000 during the week ending on Thursday last. The Bank of France gained during the week ending on Wednesday 23,307,000 francs in specie, and reduced its rate of discount from 4 to 3 per cent.

The weekly statement of the Clearing-house banks on Saturday was favorable, showing an increase of $1,176,900 in the total reserve, and a decrease of $479,700 in deposits.

The following are the figures:

	August 1.	August 8		Differences.
Loans	$282,112,600	$280,534,300	Dec..	$1,478,300
Specie	25,293,700	25,740,000	Inc..	446,300
Legal tenders	65,818,900	66,549,500	Inc...	730,600
Deposits	242,741,300	242,261,600	Dec..	479,700
Circulation	25,762,200	25,805,760	Inc..	43,500

The following shows the relations between the total reserve and the total liabilities:

	August 1.	August 8.		Differences.
Specie	$25,293,700	$25,743,000	Inc...	$446,000
Legal tenders	65,818,900	66,549,500	Inc ..	730,600
Total reserve	$91,112,600	$92,289,500	Inc..	$1,176,600
Reserve required against deposits	60,685,325	60,565,400		
Excess of reserve above legal requirem't,	30,427,275	31,724,100	Inc...	1,296,825

The stock market has been steady on a moderate amount of business. The chief event of importance during the week was the sharp decline in Columbus, Chicago, and Indiana Central Railroad stock from 16⅛ to 11⅞, caused by the default in the payment of interest, due August 1, upon some of the second mortgage bonds of the company known as "general second mortgage." The general market has shown no special features. The St. Paul and Chicago and Northwestern stocks were weak at one time—influenced, no doubt, by the pending litigation in Wisconsin in which the State is trying to enforce the Potter railroad law. Milwaukee and St. Paul Common dropped from 35⅞ to 33⅞, and Northwestern Common from 38⅞ to 36⅞; at the close of the week the two stocks had rallied from ½ to ¾ per cent. The market to-day showed considerable weakness and closed at about the lowest figures of the day, the following being the range of quotations:

	Highest.	Lowest.	Sales.		Highest.	Lowest.	Sales.
N. Y. C. & H. Con...	101	100¾	1,100	Mil. & St. Paul pref	53¾	52¾	800
Lake Shore	73⅛	72¾	7,000	Pittsburg	88¾	88¼	100
Rock Island	99⅛	99	800	Pacific Mail	46⅜	45⅞	13,900
New Jersey Central	106	106	100	Erie	32½	32¼	2,000
Wabash	36	35⅝	1,500	Ohio and Miss	24⅝	24	1,700
Western Union Tel.	75¼	74¾	10,300	Union Pacific	29⅝	28¾	11,300
Northwestern	37⅞	37¾	700	C., C., and I. C.	12⅝	12¼	1,300
Milwaukee & St. P.	34¾	34½	1,100				

The following shows the highest and lowest sales of the leading stocks at the Stock Exchange for the week ending Saturday, August 8, 1874:

	Monday.		Tuesday.		Wed'day.		Thursday		Friday.		Saturday.		Sales.
N. Y. C & H. R.	100¼	100⅜	100⅜	100½	100⅝	100¾	100⅜	100⅜	100⅜	100⅝	100¾	101⅛	11,300
Lake Shore	73	73⅜	73	73½	73	73⅝	72⅜	72⅝	72½	73⅛	73⅛	73⅜	80,000
Erie	32	32⅜	32½	32⅝	32	32½	31⅞	32	31⅞	32	32½	32⅝	19,900
Union Pacific	29	29¼	29¼	29¾	29	29⅜	28⅜	28⅜	28⅛	29¼	29⅜	29⅜	96,200

Beyond the purchase of 1,000,000 10-40's for account of the State of New York, the government bond market has been free from any event of importance. Prices have been steady and the transactions light. Nothing further has been made known in regard to the syndicate operation with the Treasury in the way of "calls" on the new 5's. The following are the closing quotations of government bonds this evening:

	BID.	ASKED		BID.	ASKED
Registered 6's, 1881, c	118¼	118¾	Registered 5-20, 1867, c	117⅜	117¾
Registered 5-20, 1862, c	111¾	...	Registered 5-20, 1868, c	117⅜	...
Registered 5-20, 1864, c	115¾	115⅞	Registered 10-40's, c	113¾	...
Registered 5-20, 1865, M and N	117	117⅛	Registered 5-20's of 1881	111⅞	112
Registered 5-20, 1865, J and J	116	116¼	U. S. Currency 6's	117½	118

Business in railroad bonds has been light, except in those of the older and sounder companies. Central, Western and Union Pacific Railroad bonds have been in better demand. The recent calling in of U. S. 5-20's has stimulated an enquiry for these bonds, which have always had a quick market for large lots. Very little is doing in bonds of roads which are in default upon their interest; the condition of the affairs of most of them is unsettled, and while such is the case buyers will be wanting.

Gold has been firm all the week, and advanced from 109¼ to 110¼. The firmness in the gold premium is due to the advance in the Bank of England rate of discount and the large shipments of coin to Europe. The total shipments for the week were $3,521,442, making the total export for the year $37,588,870 against $37,496,546 last year, and $35,237,324 in 1872.

The following shows the fluctuations in the gold market during the past week:

	Opening.	Highest.	Lowest.	Closing.
Monday, Aug. 3	109¼	109⅜	109¼	109¼
Tuesday, Aug. 4	109¼	109⅜	109¼	109⅜
Wednesday, Aug. 5	109⅜	109½	109⅜	109⅜
Thursday, Aug. 6	109½	110	109½	109⅞
Friday, Aug. 7	110	110¼	109⅞	110¼
Saturday, Aug. 8	110⅛	110¼	110	110

SPECIAL NOTICES.

TERMS: In advance, one insertion, four cents per word; five insertions, three cents per word, each. The enclosure of a stamped and addressed envelope will secure a numbered box, to which communications may be addressed.

A Teacher with Experience (ten years in music, four in drawing and painting) wishes employment in a school. MARTHA H. JONES, Meredith Village, N. H.

A Graduate (with Classical Fellowship) of Princeton, who has studied abroad, takes in New York or vicinity private pupils preparing for college. References. Address BOX 14, *Nation* office.

An Oxford M. A., of many years' experience in teaching in England and America, desires a situation as a Classical Master. Would prepare pupils for the English or American Universities. High references given on application to H. H., 1912 Latona Street, Philadelphia.

A Vassar Graduate, an experienced teacher, desires a re-engagement. Address Box 12, *Nation* office.

A Graduate of Brown University, of ten years' standing, desires a position as Professor of Botany or Natural Science generally in some College or similar institution. For information and references of the best character, apply to W. W. Bailey, B.P., Providence, R.I.

Those Seeking Admission to Harvard, Yale, or any other American College, to Sheffield or Lawrence Scientific School, or any School of Technology, can receive thorough preparation at ROGERS HIGH SCHOOL, Newport, R. I. Special provision made for Laboratory Practice. Tuition, $60 per annum. Frederic W. Tilton, A.M. (late Principal of Phillips Academy), Head-Master.

SPECIAL NOTICES.

TERMS: In advance, one insertion, four cents per word; five insertions, three cents per word, each. The enclosure of a stamped and addressed envelope will secure a numbered box, to which communications may be addressed.

Photography.—Three English Cameras complete, with Lenses, etc., etc., the most perfect yet produced; two for plates, 7¼ x 4½ in. (ordinary and pantoscopic), and one for 10 x 10 and less—the most comprehensive assortment of lenses and accessories possible. Instruction given for either at or near Boston or New York. Address W. J. STILLMAN, care Publisher of the *Nation*.

Professional Situation Wanted. A Young German Lady, graduate of the Teachers' College in Berlin, who has had four years' experience in first-class American families, desires an engagement as Teacher in a School, or as visiting or resident Governess, to teach German, French, as well as the English branches, and Music. Highest references. Address E. M. S., care of B. Westermann & Co., 524 Broadway, New York.

Two Young Ladies, Experienced Teach- ers, would like situations as teachers or governesses. Will teach Latin, French, Mathematics, and the English branches of education. Satisfactory references given. Address "J. C. G.," 312 Congress Street, Portland, Maine.

Wanted.—An Experienced Principal for a Classical and Military Institute, in a growing neighborhood, within fifteen miles of New York. Address or call on W. A. BREWER, Jr., 155 Broadway, New York.

Wanted.—A position as Editor on a Libe- ral or Democratic paper, by a gentleman of collegiate education and some experience. Best of references. Address Box 13, *Nation* office.

SPECIAL NOTICES.

TERMS: In advance, one insertion, four cents per word; five insertions, three cents per word, each. The enclosure of a stamped and addressed envelope will secure a numbered box, to which communications may be addressed.

School of Mines, Columbia College.— Courses in Mining and Civil Engineering, Geology, Mineralogy, Chemistry, Assaying, etc., etc. Send for catalogue. C. F. CHANDLER, Dean of Faculty, East Forty-ninth Street, New York.

Bellevue Hospital Medical College, City of New York, session of 1874-75. The Collegiate Year in this Institution embraces a preliminary autumnal term, the regular winter session, and a summer session. The Preliminary Autumnal Term for 1874-75 will commence on Wednesday, September 16, 1874, and continue until the opening of the regular session. During this term instruction, consisting of didactic lectures on special subjects and daily clinical lectures, will be given, as heretofore, by the entire faculty. Students designing to attend the regular session are strongly recommended to attend the preliminary term, but attendance during the latter is not required. During the preliminary term, clinical and didactic lectures will be given in precisely the same number and order as in the regular sessions. The Regular Session will commence on Wednesday, September 30, 1874, and end about the 1st of March 1875. For the annual circular and catalogue, giving regulations for graduation, and other information, address the Secretary of the College, Prof. AUSTIN FLINT, Jr., Bellevue Hospital Medical College.

Yale College—Law Department. Address PROF. FRANCIS WAYLAND, New Haven, Conn.

Mr. George Street, London, Agent of the *Nation* for Great Britain, receives Subscriptions and Advertisements for this paper. GEORGE STREET, 30 Cornhill, London, E.C.

The Nation.

NEW YORK, THURSDAY, AUGUST 20, 1874.

The Week.

THE candidates are busy writing letters, and the nominating conventions for setting up future Congressmen are now going on all over the country, or are in active preparation. Some of the cases have attracted more than usual attention—some for reasons honorable to the person in whom the public takes an interest, and some not so honorable. The genuine regard which Judge Hoar has secured by a high private character and a political course not without crotchets, but marked by the active and warlike virtues as well as the passive ones, has been shown in the general desire that he should not refuse the nomination in his district. He persists, however, and has written a letter to that effect addressed to his constituents. It is not a merely official document. He takes occasion to make some remarks on the character of Congress, and seems to think that a great deal of idle, flippant accusation has been brought against it. This is no doubt true, but the amount of scandalous matter revealed by Congressional committees, and admitted as proved, would afford the newspapers a far better justification for their too numerous inaccuracies than Judge Hoar could readily find for his implied charge against the press. Judge Hoar's assertion that Congress accomplishes well some excellent work, and that most Congressmen are honest men, is not really questioned, and to make it seems needless. But perhaps Massachusetts politics may explain his putting in that plea, when further on we come to what the boys call a side-winder for a gallant Massachusetts general, as thus: most Congressmen are good; and they showed it last winter by making short work of corruptionists and their friends—of the tribe of "office-jobbers, contract-jobbers, informers, moiety-men, plunderers of the Treasury, and their promoters and allies."

Politics in Massachusetts are in a state which beggars description. Not only are the questions of the governorship and of the senatorship delicate matters, but there is a general break-up among the Congressional delegation—members resigning, declining re-election, and in every direction confusing matters dreadfully. Butler, who appears to have come to a sudden conclusion that after all silent statesmanship is the best, declines to state whether he will run for governor or go back to Congress, or go to Europe, or allow himself to be elected senator in the place which Mr. Washburn will make vacant this winter. The cloud of mystery which surrounds the movements of the General seems to breed lesser hazes or mists in all quarters. Mr. Dawes is going to retire from public life, and at the same time is going to run for the senatorship, with the advice and consent of Butler. At the same time, it is said that if the General, disgusted with the turmoil and strife of political life, should determine really to withdraw, he will be succeeded by General Cogswell, an old foe of his, and, on the other hand, his warm friend and supporter. The principal candidates for the governorship are Governor Talbot, who would like to be governor, and Mr. Henry L. Pierce, who would not. The position of Governor Talbot at the present moment is a significant illustration of the natural effects of what is known as management. He is a commonplace man of little weight and no general reputation, who, on one of the occasions when Butler failed of the nomination for governor, by that sort of good-natured compromise which one often sees in political conventions, was put on the ticket as lieutenant-governor, being supposed to be not a Butler man, but one of those who was not an anti-Butler man either. The death of Mr. Sumner, and the election of Mr. Washburn as senator, made Talbot governor, and Talbot turns out to be a determined prohibitionist, whether from policy or principle is not certain, and his sentiments on the Butler question are involved in mystery. In other words, as the result of the compromise, or the heedless thoughtlessness of the nomination, the State has in its most important office a man whose sentiments on one of the most important questions of the day were not enquired into, and on another are not known.

In all this obscurity, one thing seems tolerably clear—that General Butler has not abandoned his ancient game of gaining control of the party organization, and that his opponents are groping about in the dark as to his intentions, and with a very dim light as to their own. The General, we are happy to say, does not appear to have the slightest chance of getting the nomination for Governor, even if he attempts it. We may observe as another hopeful sign in Massachusetts the rise in power and influence of Mr. Henry L. Pierce, one of the General's most uncompromising enemies, who has served the public well in every office he has filled, and about whom the only regret which seems to be felt in Massachusetts is that he cannot be Governor of the State and representative at the same time. Not remotely connected with Massachusetts politics, too, is the news of the renomination of Mr. Foster of Ohio, who, we hope, and do not doubt, is preparing himself during the long quiet summer days for a repetition of the manly warfare in which he engaged last winter.

The report of the Arkansas Investigating Committee appointed by Congress at the last session promises to be of a very lively character, though we imagine that the gentlemen of the committee are not going to find it an easy matter to reconcile all the evidence. But judging by what we hear from excellent authority, one committeeman, Mr. Ward, will have less difficulty than his fellow-members in coming to a conclusion; his method of reaching it will, however, call for an explanation. This impartial investigator—who has already expressed his opinion as favorable to the Brooksites, and has been so reported in the public prints—went to Little Rock in company with Dorsey, one of the precious Arkansas senators, was met at the railroad station by Brooks and some Brooksites, was taken to Dorsey's house and there remained during all of his stay in the town, was each morning driven in from there to attend the sessions of the committee, was met there by Judge McClure, formerly Brooks's man on the bench, Clayton, the leader of all this gang, Oliver, and others like them. The statements which these gentry imparted to him are supposed to be what Mr. Ward is now retailing to the Northern public as information derived from "leading Arkansas Republicans." This behavior would have done better in the Thaddeus Stevens and James M. Ashley days, but is now late. Still, with Mr. Ward and Judge Poland for two members of the committee, there is danger of some old-fashioned whitewashing. Everything looks, however, as if Clayton and his friends would have to rest content with what money they have got.

One specimen of the evidence before the Arkansas Committee will give this Southwestern, Baxter-Brooks iliad in a nutshell. The witness is a Mr. Bartlett, a New England man, once a judge, and a Republican who at the election of 1872 scratched in voting, giving Baxter his vote for Governor, but casting it for the inferior officers on the opposition or Brooks's side. He is therefore a kind of a neutral: *Question.* "State what you know as to the origin of the difficulties between Governor Baxter and the leaders of the party that elected him" (Clayton, Dorsey, etc.) *Answer.* "As I understood it at the time, it originated with an effort on the part of the Republican party proper to carry through the railroad bill. It originated with his opposition to this bill, or with his declaring that he would defeat it." *Question.* "What was the nature of this bill?" *Answer.* "There had been $5,200,000 State-aid bonds issued, and the object

of the bill was to make the State assume that indebtedness and take in lieu of it railroad bonds." *Question.* "Was that considered a fair equivalent?" *Answer.* "It was considered that it would have been of no value at all." To another question, the answer will be readily anticipated by any one who knows what has been the ss nce of reconstruction in the opinion of the carpet-bagger. It has been very simple, and consisted first in getting himself into the legislature by negro votes, then pledging the State credit to one and another railroad for its relief or its construction, then selling the guaranteed bonds and as many counterfeits of them as possible. North Carolina, South Carolina, Louisiana, Arkansas, and other reconstructed States know this history. The Committee's question to Mr. Bartlett was as follows: "What was the general opinion about these bonds; that the State had the benefit of them, or the roads, or individuals?" *Answer.* "The impression on the public mind is that the bonds were divided up between the managers of the different roads" (Clayton, Dorsey and "leading Republicans of Arkansas," who fear for the social future of the black man). As a development of the sort chronologically latest, but entirely congruous, it is telegraphed that the State Constitutional Convention now in session is considering the propriety of repudiating $9,300,000 worth of railroad, levee, and other bonds.

A good deal of surprise, for which we hardly see the reason, has been expressed in the newspapers at the announcement by the Texas Grangers of their intention to ask the General Government for a subsidy for the Texas Pacific Road. It is exactly what we should have anticipated from their attempt to get hold of the inter-State lines last winter in Congress, from their demand that the Government shall build them a line of railway to the West, and from the impudence which has characterized their whole proceedings from the beginning. It is peculiarly characteristic of them, too, that their first demand for a subsidy of a particular line should be in the case of the Texas Pacific, for this road has already received a subsidy in the way of a land-grant to the amount of 6,750,000 acres—one of those land-grants which has been so vigorously denounced by these very reformers. What the Granger wants is cheap transportation; whether by confiscation of or lobbying with the roads is a matter of complete indifference to him. If we turn from Texas to Minnesota, we there find him, in his character of commissioner, looking into the question of "just and reasonable" rates in the case of the St. Paul and Sioux City roads. These roads are unable to earn enough to pay interest on their funded debt, but nevertheless reduced their rates voluntarily on the 1st of July in the hope of attracting traffic, which must in any case be light, as they run through the country devastated by the grasshoppers. The commissioners, on learning these facts, immediately decided that the rates were too high, and ordered a further reduction.

The late Bishop Whitehouse was probably spared a pang by his dying before the recent decision of the Cheney case in the United States Circuit Court at Chicago. The Bishop was a man of a high spirit, who, as we are led to suspect, had a way of magnifying his office, natural in him, and sufficiently to his honor and credit; but the habit of mind from which it sprang was not calculated to make Judge Williams's recent decision palatable to him. It is a decree based on an application for an injunction which was made last spring by the Whitehouse side. Mr. Cheney—who, by the way, is no longer a Churchman, having gone away and helped to found a new church—the Whitehouse party wished to restrain from keeping on with the use of the Christ Church property. Judge Williams refuses the application. We have not space for all his points; but he says that Mr. Cheney on his original trial consented to be tried by the canons; that according to these he should have been tried by five assessors; that the court so affirms because these trials by canons (which really are trials under stipulations made between the parties) closely resemble trials by arbitrators; that in trials by arbitrators the law requires every one of them to be present and assisting; that Mr. Cheney was tried, not by five arbitrators or assessors, but by four; and that the proceedings of such a tribunal are null and void. At the second trial there was want of jurisdiction in the court. As, then, the sentence of the Bishop was based upon two void processes, it falls to the ground, and Mr. Cheney has all the time been rector of Christ Church. Leaving these special points, we may say in general that the court declares, in regard to the strictly societary regulations of religious societies, that for cause shown it will enforce them, as may seem legal and equitable. We have no intimation as to whether the case will be carried further.

We once more mention the Ross abduction case in order to say a word for the *Herald* correspondent. He is still working away at the other end of the telegraphic wire between here and Philadelphia and giving advice as if Solomon were a fool to him, and the latest falsehood about the Rosses which this has made it necessary for him to send on is as follows: On his theory, if Mr. Ross had at the beginning given to the public at large all the letters which he has received from the abductors, and of course had the correspondent got the early copies for the *Herald*—had Mr. Ross done this instead of keeping them secret and hidden, the missing boy would now have been found. This course the correspondent thinks so obvious that he evidently reserves in the depths of his mind a lurking suspicion that Mr. Ross is playing false. About this our friend makes an enormous uproar. An informant writes us from Philadelphia that so far at least as regards using concealment, there has been none except of a proper kind; that Mr. Ross has shown the letters received from the child-thieves to every one who had the right to see them, including friends and lawyers, thus disposing of the rumor which we noticed last week, giving it too much weight; and he adds the thought which the *Herald* man will not vastly care for, that "probably the sight of them has been refused to some meddling reporter who with his race infests the store and residence of the afflicted father." Indeed, this case and the Beecher case have really suggested new possibilities in the way of "interviewing." The Beecher case was, indeed, almost too big a blessing to be handled. For one thing, the subject was sensational to the last degree; and, for another, if you were to rake every port in the United States—and we are not afraid to add Europe—you could not have got together a company more eager to be interviewed than just this same set of people who have been filling the newspapers with their revelations and recollections. It is meat and drink to them. Keeping their names in the newspapers has been the making of half of the regiment of them, men and women, and certain quarters of New York and Brooklyn never in the world were happier than they have been for the last six or seven weeks.

The lockout of the farm laborers in the eastern counties of England has come to an end, the employers having found a sufficient supply of labor outside the Union. The Union has accordingly advised the men that they must look out for themselves or emigrate. The condition of the labor question in England has given rise to a good deal of discussion and correspondence about emigration, some of which has made its appearance in the columns of the London *Times*, under the head of "Emigration to a Free Country." The beginning of it was a letter to the *Times* from a gentleman signing himself "A Bohemian," who appears to have made a tour of the world in search of employment. He describes himself as young and strong, as "having received a good education," being "a thorough arithmetician," and "able to write and converse in most of the modern languages." Having resolved to try his fortunes in the United States, he succeeds after much trouble in finding a situation as a lawyer's clerk with a salary about equal to the average earnings of a Dorsetshire laborer. Finding, however, the professional tone in New York so disgustingly low that he cannot even perform the services of lawyer's clerk and maintain his honesty, and having perhaps casually come upon some person who advised him that the only thing for him to do was to "go West," he immediately leaves New York, and gets such employment as he can

in the country at rail-splitting and wheeling bricks; and, being treated with uniform hard-heartedness and brutality by everybody, he goes back to England. He next tries Canada, with as little success; and then New Zealand, where he finds very little sympathy, even when in "trouble or distress." All this seems to point not merely to a bad state of things in a "free country," but even to a bad state of society in the enslaved European colonies.

The "Bohemian," therefore, has probably not been very much surprised to find his letter replied to, first by a gentleman (Mr. Edward T. Bridges) who says that New Zealand is a country of which he knows something, and this knowledge leads him to suspect that the "Bohemian" has not been to New Zealand at all—New Zealand being a country where 5s. a day is paid for the lowest class of unskilled labor, and from 12s. to 15s. for skilled labor; and where it is not only possible, but "certain, and will be for years to come, that an industrious and steady man, who sticks to his trade or work, will be able in the course of but a few years to save enough out of his wages to buy a small section of land, erect a house thereon, and thus, with the additional help of his wages, attain a comfortable independence"; and thinks that the "Bohemian's" reference to the want of sympathy he found when in "trouble or distress" may be a veiled allusion to the melancholy absence of workhouses in New Zealand. Besides this, an "Anglo-American" writes to the *Times* to say that whatever may be the truth about New Zealand, the "Bohemian's" adventures in the United States must not be taken to be typical; that he himself had been an emigrant in his day, and found everything here exactly the reverse of what was discovered by the "Bohemian"; that he landed in New York with fifty dollars in his pocket in the middle of winter; went that night to an hotel, and engaged board at fourteen dollars a week without difficulty; went the next day and got a situation without having any references, in an office on Broadway; and on the next day found himself in a position of trust and confidence, sent on a mission to deposit $1,350 in a bank for one of his employers. By cultivating "the true American principle," he describes himself as having thriven, and as mixing always in "superior society."

The news as to the condition of the harvests all over the world is very good. There is every reason to anticipate a year of cheap food, and, as the general revival of business depends in the long run on cheap food, it is not unreasonable to believe that we have seen the worst of the dull times, which certainly could not well be duller than they have been during the past few months. A comparison of prices in 1873 and 1874, made by the *Economist*, shows a considerable fall in leading commodities since last year, and, prices being now favorable to consumers, we may fairly infer that the improved tone in the iron trade, which is attracting attention in England, is prophetic of improvement in other branches of business, here as well as there.

The railroad question in England has been lately discussed from a different point of view from that which has been occupying public attention in this country—that of the excessive number of passengers maimed and killed by the roads. A "society for the protection of railway travellers" has now been formed, under the leadership of several influential men, the terms of subscription being very low in order to make the membership large. The object of this society is stated to be the diminution of risks arising out of causes within the control of the roads, such as unpunctuality, insufficiency of "permanent-way," inadequacy of establishments, and the neglect to adopt the various means of safety constantly recommended by the Board of Trade, the correction of defects and discomforts in travelling accommodation, the introduction of more humane arrangements for the conveyance of cattle, and other similar objects. Of course a great deal depends on what amount of vigor is put into the work; but these are certainly the kinds of things on which supervision, if vigilant, would be likely to have some effect. You cannot tell how much it is fair for a company to charge for transporting a passenger a particular hundred miles, but you can tell whether he gets to the end of his journey, whether maimed or dead, or alive and well, whether the train in which he travels runs "on time" or without any regard to the prescribed time, and whether cattle are tortured into disease and unfitness for human food by a more than brutish disregard of the creatures' wants. Such a society, in taking up the cases of the poor and unfriended, might do much good in any country.

Most of the chief European Governments have recognized the Spanish Republic, the lead in the affair being taken of course by Germany. The ostensible reason is the unhappy condition of the country and the Carlist atrocities. How far intervention will be carried remains to be seen, but no doubt far enough to prevent any possibility of the Ultramontane party in Spain deriving any material aid from their friends in France. The recent attempt on his life at Kissingen has had the effect of greatly strengthening the hands of Bismarck in his war on the Church, and it would not be a very far-fetched hypothesis to explain the recognition of the Republic in part by the renewed resolution of the Germans to keep their war upon the Pope an unhesitating one. The Carlist atrocities are, of course, denied by the Carlists, who in turn declare the Republican troops a set of savages. We fear very much that there is little reason to rejoice in this new addition to the area of freedom. A Spanish Republic protected by the great military powers against an intestine revolution, with foreign fleets policing her waters, is too shadowy a political structure to pin our faith to. It is greatly to be hoped that the recognizing powers may put an end to the barbarous warfare which is distracting and completing the ruin of Spain. The interests of humanity and civilization demand that the country should not be entirely free to give itself up to rapine and murder; and if a protectorate is needed to accomplish this object, the sooner one is established the better.

Two French prisoners, half-political and half-criminal, who have acquired a world-wide notoriety, are now at large again—Rochefort and Bazaine. The secret of the latter's escape from the Isle Ste. Marguérite is only partly explained, and evidently there are those on the other side of the water who are willing to keep it an entire mystery. Eight persons are said to have been arrested on suspicion of having aided his escape, the charge of treachery playing in this the important part that it usually does in the explanation of French events. A spirited attempt has been made, or is in process of being made, to throw an air of romantic adventure over the escape of the Marshal, as there was in Rochefort's case to convert the escaped convict into an old-fashioned refugee—a martyr to the tyranny of princes and emperors. Thus, in Bazaine's case we learn that the prisoner languished (if we are to believe the London *Telegraph*, which we certainly do not mean to do unless under compulsion) in the very cell "in which the Man with the Iron Mask languished so many years, and from the window of which the unknown prisoner flung into the sea the silver plate on which he had previously scratched his name and history"—this cell, however, being unlike most cells, as it is a "lofty apartment," and contains "a fire-place and large window." This we suppose is the same room elsewhere in the account described as a "small sitting-room," "plainly furnished," with a fine likeness of the Pope on the wall, with a Latin autograph. No such luxuries as these, we fear, were furnished the Man with the Iron Mask, nor was he permitted to have a valet, nor the companionship of an old staff-officer, nor to receive frequent visits from those nearest to him. This is probably the reason, too, why he did not walk out of prison one fine night and take boat for Italy. The fact is that the Marshal was not in prison long enough, nor was his character as a victim well enough established, to make him a very romantic object, and the learned discussion now going on in some of the newspapers as to whether or no he is an extraditable convict will not tend to make him more so.

THE SIGNIFICANCE OF THE FALL ELECTIONS.

IN the history of Congress the present bears many indications of becoming an extraordinary year. The last Congressional election sent to the House an unusual preponderance of new members; but the old members thus supplanted were for the most part of the unknown class. So much so was this the case, that the change in the material of the House was somewhat of a surprise to the public, being discovered by means of newspaper statistics rather than by the absence of familiar names. The front ranks of both parties showed very little change, and continued to be filled chiefly with well-known men. By the coming elections this condition of the House will probably be reversed. The number of new members may not equal that of last year, but a very noticeable disappearance will take place of names with which the people of this country are now well acquainted. The new members in the present House have been for the most part a mere following. With little legislative experience to guide them, with little intellectual training to fit them for doing what they have never been specially taught to do, they have been largely overawed by their own practical ignorance, and not a little intimidated by the manual dexterity of the "experienced leaders." Leaving home in the belief that their newly acquired office was one of great power and consequence, they have found that in Washington it of itself makes a man no more distinguished than that of constable in their native town. Supposing at first that national legislation is a plain highway along which men might walk and talk in a common-sense manner, and be allowed to vote upon measures when they have maturely considered them, just as at any public meeting of intelligent men, they have been dazed by finding that Congressional practice has been worked up into a thoroughly artificial maze, whose labyrinths require two or three sessions of practice before the new member can master the doublings and windings, or be on his guard against or ready to take advantage of its many indefinable "short cuts."

The larger part of the Republican "new members" seem to have passed through three stages of desire: 1st, they wanted to do right; 2d, they wanted to do something; 3d, they wanted to do anything. It was perfectly natural that such men thus circumstanced should pass through these phases of intention. It was almost inevitable that they should take to introducing bills on the solitary occasion when anybody is allowed to get the floor, if only to let their constituents know that they were still alive and actually in Washington. Later, as they became accustomed to the bedlamlike confusion of the House, it was to be expected that they would make speeches to the reporters on the popular side of the "salary grab" or other prominent topics. But when these preliminary efforts at individuality had been tried, it was just as natural and inevitable that a hundred and more of untrained and practically ignorant and incompetent men should sink into a following. If there had been one truly powerful statesman on the floor of the House—one person in the party, there, who was really reverenced as a great man, or if there had been a few able and experienced members thoroughly united in knowing what their party's policy was and in holding the mass of members up to some predetermined work of legislation, it is probable, it is reasonably certain, that the mass of new members would have made an efficient and respectable party majority in Congress.

Such being the material of the rank-and-file, it is necessary merely to glance at their leaders to account for their conduct. The chairman of the Committee on Ways and Means is the member who is supposed to be the leader of his party in the House. In this case he is also the senior member of the House and possessed of an experience largely in excess of that of any other Republican upon the floor. But Mr. Dawes came into this Congress with a reputation impaired by his connection with the Crédit-Mobilier transactions, and well-nigh shattered by the disingenuous letter whereby he sought to mislead and deceive all who trusted his assurances on that subject. He also soon appeared to have entered into a tacit compact with the worst man in the House, or at least to be in such fear of him as not to venture, when he could possibly avoid a collision, to oppose his schemes or thwart his designs. Apart from these hindrances, he was at best fitted to be, not the leader, but at most the censor or balance-wheel of the House. Hence the new members found in him, not the person who was directing and urging, but the person who was perpetually holding back. Repeated and constantly recurring injunctions and warnings and threats against extravagance soon had about as much effect on them as the stereotyped advice of a schoolmaster ordinarily exercises on the minds of a throng of ardent, restless boys. If Congress were a board of audit, whose sole business is to cut down estimates and adjust accounts, Mr. Dawes would have been in his place. But in a legislative body like the House of Representatives, he bore about the same relation to a leader that the drag of a coach does to the driver. The chairman of the second committee in importance, that on Appropriations, on the contrary, possessed many of the characteristics of a leader, and, moreover, had subjected himself to a more comprehensive and thorough mental training for legislative work than any other man in the House; but unfortunately for himself, and indeed for the country, he was in a position which might be termed "the personal defensive." He had been censured by the Crédit-Mobilier Committee, though the censure rested on slighter evidence than that of any other person inculpated—the mere word of Oakes Ames, unsupported by any of his usual memoranda—and he had been blamed for his unwilling part in the "salary-grab" enactment, and the Sanborn-contract resolution soon after required explanation. With three such defences on his hands, no man could suddenly become a leader in Congress, or expect to control and mould the opinions of the public, upon which every legislative leader must sooner or later rely. The chairman of the third committee, the Judiciary, it is needless to say, was General Butler. Very ready was he for the situation, and very well did the situation suit him. Readiness and audacity are tolerably sure to sway a crowd wanting to do something yet doubting what to do; and readiness and audacity are the two qualities which General Butler possesses in such excess that one may well doubt whether he possesses any other worth naming. Very quickly he made himself the leader of the majority in the House; and to what point of folly he might not have led them no man can surmise, if providentially the Sanborn disclosure had not come to arouse the country so thoroughly that even General Butler had to stop, like men who value their characters, and stand upon the defensive.

Such being the peculiar weakness of the present House, there is certainly ground for anxiety when we look forward to the fact that in all probability this weakness is to be greatly extended in the next Congress. Mr. Dawes having reached the highest position in the House, and then found that his reputation and influence were rapidly leaving him, has sagaciously determined that "retirement from office" and active work in home-politics are more likely to prove his stepping-stone than any public service which he can render. General Butler seems to have taken the same view of the duty he owes to his country. But neither his friends nor his enemies seem confident of his withdrawal, and the only thing certain is that there is no other place in the world where he can perpetrate so much mischief as in the House of Representatives. When it becomes absolutely certain that he will not be there to deride able men and bully and mislead weak ones, the decent part of the community may well thank God and take courage. But even if this restless element of positive evil be withdrawn from the next Congress, there will still be a long list of retiring members which includes the very best of the House. It seems, indeed, as if an epidemic for retirement had broken out in both parties, and that the greater portion of the men who really perceive the wants of the country had suddenly grown conscious of their inability to raise Congress to the dignity of a working body, and in weariness and disgust had simultaneously given up the task. Generally, the losses are by voluntary retirement, but political conventions have not kept their mischievous hands off in all cases. If the integrity, moral courage, and good sense of Mr. Willard of Vermont reigned in Congress, everybody knows that that body would possess the

almost unlimited confidence of the country. But Mr. Willard has just been defeated in convention, and another new member is to take his place.

Yet the ground of solicitude does not stop even at this point. Not only does there seem to be an epidemic of retirement on the part of members, but also another epidemic of refusal on the part of prominent and respectable private citizens who may be solicited to go into Congress. As the Springfield *Republican* says: "It is positively becoming dangerous for a Massachusetts newspaper to mention the name of any conspicuously able and deserving citizen (Republican in politics) in discussing the political probabilities. The odds are that the gentleman named will at once sit down and write a curt note to the editor, signifying his inflexible resolution not to be a candidate." What does all this mean? Is the recent saying of Lord Lytton coming true, that the American is trying "to accomplish an experiment in government in which he will find the very prosperity he tends to create will sooner or later destroy his experiment"? Has the "conspicuously able and deserving citizen" perceived that our national legislature is properly a place for hard and unpretentious work—for study, training, caution, and reflection; but that it has become a place for ridicule, detraction, ignorant assumption, and mercenary combinations—a place which can only be ruled by an extremist like the late Mr. Stevens or a demagogue like General Butler? Very rarely, if ever, has there been a time when the public welfare so completely required intelligent honesty in Congress, and never has there been a time when the intelligent and honest seem so averse to going there. Raising the pay seems to have done a great deal toward bringing Congress down in individual estimation, and we have now to reverse proceedings by trying to restore to the position some of its former honor. When the educated, intelligent, and respectable citizen feels assured that in Congress he will be able to mingle and cooperate with educated, intelligent, and respectable associates, he will again deem the legislative service a distinction and a pleasure.

THE RATIONALE OF EMIGRATION.

WE have elsewhere made a reference to the curious correspondence on the subject of "Emigration to a Free Country" which has lately been going on in the columns of the London *Times*. The most ardent lover of the most minute facts cannot candidly say that it sheds much light on the relative merits of the different countries mentioned for those who are seeking a home. "The Bohemian's" whole story may be and very likely is false, and yet America may be a bad place at certain times for some kinds of emigrants; the New Zealander's representations may be perfectly true, and yet New Zealand may be very unattractive from some points of view. The "Anglo-American's" experience, pleasant as it is, is unlikely to be repeated. The *Pall Mall Gazette*, deprecating the efforts of those "who exultingly heap up evidence that the prospects of a laborer in Canada or Australia or the United States are no brighter than they are in England," says "single experiences go for little either way"; and at the same time is inclined to think that "more attention is to be paid to such letters" as one which has lately appeared in an Irish newspaper (evidently written during the depth of the depression consequent on the panic), by a Mr. Walsh, one of the Jesuit fathers in New York, who says that in every large city in the Union thousands of able-bodied men are standing idle and starving; that no roads or canals are being made; that the farmers "raise only as much as suffices for domestic consumption" and employ no hands; that even female servants are looking in vain for places; and, finally, that this is only the beginning, and that the United States are "likely to undergo a phase of misery the like of which no tongue can tell." This is the picture of a country going to pieces, and few people will recognize its truth. The *Pall Mall Gazette* admits, indeed, that it is very likely overdrawn, but thinks that it is entitled to credit as coming from a tolerably unbiassed source, and from one having probably a wide means of information. But until we know more of Father Walsh, we shall be inclined to believe that his letter is nothing more than such a one as any excitable man might have written in an exciting time—let us say, immediately after the panic of 1837, and that as a prediction of the industrial future of the country it is worth as little as such a letter would have been then. Most people in reading it will be inclined to begin with the reflection which the *Pall Mall Gazette* made apropos of the other letters, that what is needed now is a cessation of irresponsible correspondence and communications on this subject, and the accumulation of detailed and precise facts with regard to the labor markets of various countries.

The emigration question, however, is not one which, in the present state of the labor market and trade, can be definitely and for all time settled; indeed, it is one which, with every new steamboat line between here and Europe, and every new railroad line between here and the West, will become more difficult of final settlement. In modern economy, there is nothing more noticeable than the rapid creation and depression of trade in particular spots, and the ease and rapidity with which a trade which finds itself depressed in one place reappears in another shortly afterwards in a prosperous condition and with the necessary attendant labor. Sometimes it is a war which is the cause of the phenomenon, as when the shipbuilding industry was driven out of this country during the Rebellion; sometimes it is a tariff; in another case, it might be the condition of the currency which caused a change. New England has changed within the last generation from an agricultural to a manufacturing country; already since the war manufactures are springing up in the South; shipbuilding is reviving in Maine. Every one of these changes as it occurs has an influence of some kind, now depressing, now elevating, on the labor market, and the effect has been not to render the emigration question simpler, but much harder than it was before. So long as a trade once established was likely to remain in a country or city a hundred years, the emigrant could very easily make long calculations. But now, if he emigrates on account of a depression in the particular trade which he follows, ten years hence, perhaps, that very trade may be flourishing in the very place he left it depressed.

On the other hand, it is far more important for all but the most unskilled labor to remain steadily at the same occupation. Formerly, in this country, the theory and the practice both were that the European who came over here came ready to turn his hand to anything—saw wood, dig, be carpenter, blacksmith, mason, lawyer, or member of Congress, as opportunity might occur. But the increasingly minute subdivisions of employment are making it every year more and more dangerous for emigrants to attempt this old-fashioned rôle. Therefore, the question is not so much, Is there not plenty of land in the United States, and a welcome for all? as it is, Can a particular individual find in the United States the particular work for which he istrained? And where, and when? It is obvious that even those agricultural laborers who have been looking into the question for themselves, through Mr. Arch, want to find the same kind of work they have been doing in England. Even they are by no means jacks of all trades.

Again, the rise to power and influence of the unions makes the question more difficult. The trades-union is, as every one knows, a voluntary organization of a democratic character, which has a general jurisdiction over the particular labor-market related to a particular trade. It has a general fund, levies assessments, supports men during strikes, and exercises a general supervision over them. In the last resort, as in the case in hand, it advises and very likely furnishes the means of emigration. The result of all this is that the laborer learns more and more to rely on this organization, to be idle when it is idle, and to work when it works. Indeed, he subjects himself to great inconvenience, if not suffering, by remaining outside the union. Therefore, it is obvious that the question of emigration will now be considered with reference not so much to the happiness of the individual laborer as to the prosperity of the union to which he belongs; and in many cases when, if left to himself, he might very likely choose to emigrate, as he is not left to himself, he does not choose at all. In the agricultural laborers'

strikes, the men seem in process of being driven out of the country against their will, though by accepting their employers' terms last year they might have stayed, because their enforced idleness has exhausted the funds of the union.

We do not by any means intend to say that the emigration question is not one which deserves study. It needs more than it has ever received. What we desire to point out is that the discussions usually carried on on this subject are illogical and futile, because based on insufficient or inapplicable evidence; that the question will not be settled by a comparison of certificates of national character given or refused by individual emigrants; nor will it be settled once for all at any time. The sudden changes in trade and commercial centres, the growing facility of locomotion, the growth and importance of the unions, all make the question much more complicated than formerly. We shall have no solution of the vague question, "Is America, or New Zealand, or Canada a good country for the emigrant?" But what the laborer might fairly expect, and what he ought to have, is information of a detailed and precise kind as to the condition of the market in particular trades and at particular times and places. Last winter, when Father Walsh was taking so gloomy a view of the future of the country, and when no sane man would have advised the emigration of a laborer in any trade to this city, negotiations were going on, and very seasonably so far as one party at least was concerned, between our Government and the Russian sect known as the Mennonites—a simple agricultural people who merely needed a quantity of unoccupied land—for the cession of a large tract in the West. The laborer who did not emigrate to New York, and the Mennonites who are now on their way, both understood the logic of emigration thoroughly. A great deal of stress is now laid by the newspapers on the fact that there is an apparent tide of re-emigration to Europe from the United States, and this is supposed to point to a cessation of emigration from the other side. But apart from the difficulty of obtaining any reliable statistics, it should be taken into consideration that the rush to this country must be expected to fall off after a commercial panic. At the same time that we hear of this re-emigration, we hear of the emigration from England of two large bodies of men, one from the agricultural, the other from the mining districts.

THE GREAT SCANDAL.

MR. BEECHER'S explanation of the letters from which Tilton published extracts six weeks ago only appeared on Friday last. It ought to have appeared at the earliest immediately after Tilton's letter to Dr. Bacon; at the latest, immediately after Tilton's charges before the committee. Every day of the subsequent delay lent some force to Tilton's accusations by sapping the public faith in Mr. Beecher. This delay was, in fact, the crowning blunder of a series of blunders, the like of which we have never seen or heard of. It would only have been justifiable if the committee which was trying the case had been a body in whose discretion the public had confidence, whose judgment it was eager to hear and likely to respect. But the committee was made up in a way which from the outset deprived it of all weight. It was composed of Mr. Beecher's personal friends and adherents, selected by himself; and we think we are correct in saying that not a man of them had any experience whatever in the conduct of judicial enquiries, or any training likely to take the place of experience, or any such reputation before the world as would lead outsiders to rely on his opinion. Mr. Beecher's waiting, therefore, until such a tribunal had "got all the evidence" before he, the principal actor in the transaction, made his statement, wore to some people the appearance of child's play; to most people we fear it wore the appearance of something worse. In truth, it added one more fact to the case against him, and a fact, too, which has seriously increased the difficulties of his defence. His audience last week was by no means as indulgent as it would have been a month earlier, and the explanation which he has finally produced is not the kind of explanation which people are disposed to excuse a man for not producing hastily. It is neither a cold, careful narrative of facts, nor a technical or closely-knit argument. It is an impassioned, pathetic, somewhat effusive, and highly-wrought history of four miserable years, full of confessions of weakness and folly, of appeals *ad misericordiam*, and of descriptions of states of feeling—of the kind, in short, which is most effective when it is fresh, and over the composition of which the world does not permit a man to linger. If it is to carry conviction successfully, it must come hot from the heart at the first moment, and not after the witnesses have all been heard and the plaintiff has put in all his documents.

It must be observed, too, and we fear most people have observed, that there is not in Mr. Beecher's long paper a single good reason to be found for his not having answered the first day. None of the evidence taken has been such as to alter his line of defence since Tilton last spoke. Moreover, considering the depth of feeling with which he has deplored the effect on public morals of the prolongation of this wretched enquiry, we do not well know how the employment of a committee which could only sit two or three hours every evening is to be excused. If there ever was a case in which the court should have sat night and day until the work was done, it was this one. As matters have gone, the committee have had the air of men who enjoyed the dirty business in which they were engaged so much that they tried to keep it hanging on as long as possible, apparently unconscious that they had opened and were sitting over a cesspool the fumes of which were poisoning the whole country.

We mention all these things to show that we are fully conscious of all the weaknesses of Mr. Beecher's position. We have refrained thus far from expressing any opinion on the merits of the case, and have confined ourselves, in such references as we have made to it, to warning him against possible mistakes in his mode of meeting his accusers. We will add that the impression we received from the "apology" contained in the Tilton letter to Dr. Bacon was, that Mr. Beecher had possibly fallen into some indiscretion in his relations with Mrs. Tilton, which, in his morbid religious sentimentality, he had fearfully magnified and described to himself in unmeasured terms. The phrase, "he would have been a better man in my circumstances than I have been," was hardly explicable on any other hypothesis. But we felt, as every one felt, on the publication of his letters by Tilton, that in them lay the gravamen of the whole charge; that the explanation of them would no doubt be an exceedingly difficult task, but that it ought, if it was attempted at all, to be attempted at once; and that there was positive blindness in supposing that it could be safely laid over for even a day. We have accordingly read over Mr. Beecher's defence, not only without prejudice in his favor, but with a good deal of not unwarrantable disposition to judge him severely; and we are bound to say that we think he does furnish an explanation of his conduct which people outside Plymouth Church can comprehend, and that it does wholly relieve him of the graver imputations so persistently thrown on him.

The true story of the affair, when disentangled from the curious web of rhetoric in which he has enveloped it—and of which his comparing Mrs. Tilton on her bed, when he went to her to get her to sign her retraction, "to some forms carved in marble that he had seen upon monuments in Europe," is a striking and suggestive illustration—we take to be substantially this: Tilton's ill-treatment of his wife, combined with her own religiosity and Mr. Beecher's strong sympathy, led her gradually to contract an affection for the latter, which after a while presented itself toher own conscience as unlawful; and as she was frequently quarrelling with Tilton and then making up, she used a confession of this over-fondness for Mr. Beecher as the means of cementing one of her numerous reconciliations with her worthy husband, and at the same time of giving a little spice to the pietistic gush with which she appears to have been in the habit of deluging him, and of which he was doubtless, as he was a wayward gentleman, getting a little tired. This confession appears to have found Tilton in a bad way. He was losing his professional position, losing his credit with his friends, and his not very strong head was completely bemuddled by the multitude of new and strange doctrines which had risen on his path after his anti-slavery occupation was gone. In these great straits, being desperate and apparently shameless, the idea of turning his wife's relations with Beecher to worldly account seems to have taken possession of him, and for four years he treated it as a vein to be worked the more assiduously the more his fortunes were failing. To enable him to do this effectively, a go-between was of course necessary, and this was found in the person of Mr. Francis Moulton, an old classmate of Tilton's, of about the same amount of mental and moral culture, but a shrewd, smart business man of the Butler school—fond of intrigue—loving, like Butler, to do plain things in crooked, underhand ways—mixed up more or less in doubtful transactions, not at all scrupulous, making no pretence to be a Christian, and no more of a gentleman than the great Ben himself—a sort of person, in short, whom men of honor and refinement of feeling avoid and fear. Finding Tilton in trouble, and being fond of him, this person appears to have undertaken to extricate him by the means which had suggested itself to Tilton's own mind—viz., by exploiting, or, to use the slang of Butlerite circles, "striking" Beecher. In Beecher, it must be confessed, they found an easy prey. His story of Moulton's operations on him bears the unmistak-

able impress of truth, and it has never been our lot to read anything more pitiful. The two confederates appear to have kept the unfortunate man on the rack for four long years, harrowed by the most horrible terrors and anxieties, Tilton standing in the background as an injured and threatening husband, and Moulton running to and fro as a "mediator" and pacificator, extracting confessions and letters of contrition from Beecher by the handful, making him believe that his communications were all strictly "confidential," and then showing them or repeating their contents or giving copies to half the town, pretending to him that this or that cause of fear had passed away or was "buried in oblivion," and then setting it afloat among the friends and confederates of the pair as a rumor, in such shape and with such an air of authenticity as to plunge Beecher into fresh alarm and bring him once more to his knees.

Tilton and his friend finally connected themselves with Woodhull, Moulton inviting this woman to his house as a guest; and then they compelled or seduced their unhappy victim into meeting her, and there he was at first flattered and then actually threatened by her. They crowned his humiliation by trying to get him to preside at the meeting in Steinway Hall at which she proclaimed the gospel of lechery. In this they failed, and Tilton took Beecher's place. Tilton got his wife to sign a paper accusing Beecher of having made improper proposals to her, having apparently not at first made up his mind that it would be necessary to accuse her of actual adultery; and this he showed or talked of. In fact, throughout the whole transaction he appears to have been in constant danger of spoiling his own game through the pride and satisfaction he took in the éclat of having his wife's chastity assailed by so distinguished a man as Beecher. He was so eager in proclaiming this that he was frequently on the point of driving his victim to the wall, and causing a complete exposure before he had got all he needed out of him. Moulton appears to have backed him up with extraordinary skill and daring. When Beecher, almost driven crazy by the news that Mrs. Tilton had accused him in writing, made his way into her room and obtained her written withdrawal of the charge, Moulton actually pursued him to his own bedroom, and then and there extorted the paper from him, "opening his overcoat, and, with some emphatic remarks, showing a pistol, which afterwards he took out and laid on the bureau near where he stood." We suppose no decent man has read Mr. Beecher's statement without feeling his pulse quicken when he learnt that Mr. Beecher, instead of sending out for a policeman, or taking his friend by the throat and kicking him down-stairs, pistol and all, "gave the paper to him." After this incident, Beecher appears to have been on as friendly terms with Moulton as ever, and beslavers him in all his letters with expressions of affection and admiration. To sum up, they got all the "papers" they wanted from him and $7,000 in money, and then, by way of tightening the screw, raised the charge from improper solicitation to actual adultery, and at last, finding the orange was squeezed dry, they produced their budget of filth to the public. Moulton, then, though released from all obligation of secresy by both parties, declined to testify on grounds of honorable delicacy, but at the same time told most of what he said he knew—and this most damaging to Beecher—to the reporter of the Chicago *Tribune*, for publication in that paper, Tilton at the same time furnishing his wife's letters to the same journal, to show how happy his married life used to be before it was ruined by his pastor. A more revolting tale, as far as these two are concerned, is not to be found in the literature of crime.

The main question of interest for the public, however, is of course the possibility of accounting for Beecher's mental agony, as described by himself in his letters, by the circumstances of the case as he recounts them. We do not think this would have been possible if the letters had stood as Tilton produced them and there had been no others in existence; but the additions Mr. Beecher makes show clearly enough that the offence he had in his mind was much less grave than the one with which he was charged, and that he never got over the demoralization caused by learning that Mrs. Tilton, the "beloved Christian woman," as he described her, had not only confessed that she had given him too much affection, but that he had sought to seduce her. This clearly unmanned him, and we think had a great deal more to do with his subsequent misery than he admits. He is *now* evidently anxious to make it appear, and doubtless honestly believes, that what preyed most on him was his having helped to ruin Tilton by denouncing him to Bowen, his employer. But, odd and weak as he appears in the transaction, the fear of this last fact becoming known can hardly have reduced him to despair.

To make his conduct appear rational is no part of our present business. Nor need we add one word to the condemnation which he himself passes on it in his statement to the committee. He speaks of himself, as far as regards his dealings with Tilton and Moulton, as severely as any one else could desire to speak. But then he evidently fails to see, what most other thinking people see, that the calamity which has overtaken him, and bids fair to cloud his declining years, is the not unnatural result of his philosophy of life. He acknowledges that he acted in some sort as a father to Tilton after this man had left college, and he was mainly instrumental in pushing him into prominence. But in doing this he showed the same lamentable lack of judgment and discrimination which has in a higher degree marked his course in his late troubles, and has surrounded him with the noisome and unclean crowd of busybodies who have figured in the "Scandal." He found Tilton a smart young reporter, with little or no outfit in the way of knowledge or training of any kind, with a lively fancy, and the seeds of an inordinate vanity. He at once took him under his patronage, pushed him into a position on the *Independent* which, small as were its demands, was probably above his resources, made him at the age of twenty-six his confidential friend and companion, and then went off to Europe leaving him in what he calls "one of the proudest editorial chairs in the world." If Tilton's brain in this position was soon addled by vanity and ambition, and if when the abolition of slavery left him without a subject for his rhetoric he went crazy after novelties, we think Mr. Beecher more than any other man was to blame; for we greatly doubt if, when Tilton was humble and obscure and docile, he was ever honestly told by his Mentor that knowledge, study, and hard work are more necessary to fill editorial chairs than gaudy sentimentality. We will add that it was not until Mr. Beecher had rushed down to the Astor House with the impetuosity of a youth of twenty, and married a couple who did not belong to his church and had no legitimate claim on him, one of whom was dying from a wound inflicted by a jealous husband, and the other of whom was if lawfully, not truly divorced, that Tilton began the publication of those strange articles on marriage in the *Independent* which foreshadowed his present ruin. They appeared immediately after the Richardson tragedy, and in fact they grew out of it, and with characteristic fatuity the author allied himself on this occasion with John Milton. He was by this time separating himself from Mr. Beecher, and, in fact, had come to look on himself as the greater man of the two; but it was soon painfully evident that he had not enough substance in him to stand alone. Yet Mr. Beecher, who knew him as nobody else knew him, seems never to have found him out. Nay, at a still earlier period, in 1863, when Mr. Beecher was in England, one of the foremost men in America, with a fame that filled both worlds, he had, it appeared, nobody to whom to pour forth his inmost soul on this side of the water but this flighty and half-taught boy. His letter to Tilton on that occasion has been published; so has a later one of Tilton's to him. They read like epistles of Hattie to Minnie, and Minnie to Hattie, from two distant boarding-schools, and they make one wonder that Mr. Beecher should have so long filled the position he occupies without falling into some such scrape as the present, and prepare one for his friendship with Moulton, and with certain of his adherents in Brooklyn whose manœuvres in his behalf have so disgusted the public during the past year.

We will not say all that might be said of the tendency which this affair has clearly revealed in Mr. Beecher to prefer the society of his inferiors to that of his equals, for it is a fault into which all clergymen are more or less liable to fall. A very successful minister becomes inevitably an object of homage to a large body of women and of uneducated men; and it is a homage so sweet even to the strongest heads that nothing but great vigor of character prevents a man from gradually avoiding all circles in which he is not likely to receive it, and in which his sayings are likely to meet with irreverent handling. And yet no position is more full of moral and intellectual danger than that of "king of one's company." Nothing is more necessary for moral and mental health and discipline than the society of one's equals; and anybody who finds that he shrinks from it may be sure that he carries within him the seeds of decline, and he may be thankful if some fine day he do not find that he has, like Mr. Beecher, passed into the hands of a crowd of religious sharpers, ready to trade on his fame and get distraction out of his agony.

This tendency has been aggravated in Mr. Beecher's case by peculiar views of social obligation, to which we have had occasion to make some reference once or twice before. He has long held a theory, and has, we believe, honestly tried to live up to it, that it is man's duty, as he expresses it, "to look at the world as God looks at it," or, in other words, to govern himself, in his dealings with his fellows, by inferences of his own as to the manner in which God would act under similar circumstances. As his God is wholly love, and is no respecter of persons, attempts to imitate Him result simply in the deliberate and systematic suppression of all discrimination touching character and conduct, and the cultivation of a purely emotional theology, made up, not of opinions, but of sighs and tears and aspirations and unlimited good-nature. As God loves and forgives the sinner, why should not we? In his sight there is after all little or no difference between

Bishop Potter and Bill Tweed, why should we, His creatures, try to make any? As Christ associated freely with publicans and sinners, why should we attempt to indicate the existence of moral superiority on the part of one man over another? Moreover, since our religious life consists largely of expression—that is, the communication by one to another of what he or she feels about death and judgment—and in fact the church exists for the promotion of this expression, ought we not to take each person's account of his moral condition, and not look too nicely into the conduct of his life? We do not think we exaggerate when we say that Mr. Beecher has tried this system fully and faithfully in Brooklyn, and we do not fear to add that the events of the last three months were not necessary to satisfy people of its failure. It makes a state of society in which the self-respect of the honest, the manly, and pure-minded is lowered or destroyed, and in which that of the foul, the unscrupulous, the shallow and tricky, is raised and strengthened; and in which the good and bad and indifferent, by "pooling" their character, as the railroad men say, produce a mass of corruption, indecency, and vulgarity which has to be periodically washed away by some such tempest as we are now witnessing.

FRANCE.—A REPUBLIC WITHOUT REPUBLICANS.

LAUSANNE, July 27, 1874.

THE last parliamentary battle of any importance has just been fought, and I have escaped from Versailles while the smoke was still in the air to get a little necessary rest. The result was not unexpected to me. The proposition of Casimir-Périer was the occasion for a new struggle between the Republicans and the Monarchists, but since the downfall of M. Thiers it is quite clear that the Republican cause has not been in the ascendant. The Casimir-Périer proposition reminds me of the verses of Barbier in his now almost forgotten 'Iambes':

"Non, non, la Liberté n'est pas une comtesse
Du noble faubourg Saint-Germain,
Une femme qu'un cri fait tomber en faiblesse,
Qui met du blanc et du carmin!
C'est une forte femme aux puissantes mamelles,
A la voix rauque, aux durs appas,
Qui, du brun sur la peau, du feu dans les prunelles,
Agile et marchant à grands pas,
Se plaît au bruit des camps, aux sanglantes mêlées,
Aux longs roulemens des tambours,
Et qui prend son plaisir aux funèbres volées
Des cloches et des canons sourds."

This is and will long remain the ideal republic in France—the Republic of Danton, of Marceau, of the soldiers of the army of Sambre-et-Meuse. Gambetta tried to galvanize it; he played Danton, but victory did not answer his call; he smote the ground for armies, but armies did not spring up under his feet, and his ill-equipped, disorganized levies crossed the Loire instead of the Rhine. Some of the Communist leaders—Rossel, for instance—dreamed also of a sanguinary, despairing, bloody republic; but the Commune could only inflict wounds on France, and the Germans witnessed from Saint Denis the conflagration of the monument which their own hands would have spared.

The republican ardor has always been in France a fever, a sort of disease; it was so in 1793, then again in 1848, and now we see the same phenomenon, and the malady goes through the same stages. We have our Girondins; there are always some men who believe that this virago, so graphically described in the verses of Barbier, can be changed into an honest matron, a good mother of a family; men who believe that the absence of a king is enough to constitute a republic, theorists who work at constitutions as did the Abbé Sieyès, who made, if I am not mistaken, ten perfect constitutions in his lifetime, and found that he had constituted nothing but an absolute emperor. Casimir-Périer is the type of our modern Girondin; he is never tired of saying that he always was a monarchist till the monarchy seemed to him to have become impossible. In his proposition he says in the first article that the government of the Republic shall be composed of a president and two chambers, and in article three he inserts a right to revise the whole constitution. He would like to continue the *essai loyal* of the Republic, and, if the trial did not succeed, to change the Republic by law into a constitutional monarchy. His Republic is like a watch with a key to it. It has never occurred to his mind that such changes are not legally possible. How would our so-called Conservative Republicans know that their Republic had failed? They would probably only pronounce it a failure on the day when they were excluded from power, and in that case the key of the revision clause would no longer be in their hands. To say beforehand, "We will make a government, we will call it republican; but if Gambetta and his friends get a majority in the elections, we will call for a king," is a sort of reasoning which seems to me almost childish. Gambetta is more consistent; he was a republican under the Empire, in the face of Napoleon III.; he stigmatized the Second of December and its partisans; he would have remained a republican if the Comte de Chambord had been called to the throne. He is a republican because he has republican principles. M. Casimir-Périer confesses that his principles are not republican; he is eclectic; he does not care for the form of government. No religion can make much progress if it is preached by unbelievers.

It is therefore not to be wondered at if the Chamber has rejected the Périer proposition, and shut itself resolutely up in the Septennat. Suppose we look at the nature of the Septennat. It would be difficult to theorize over it, as Montesquieu did upon the various forms of government. In reality, the Septennat is nothing better than the government of necessity. Much has been said lately in France about the Stadtholders of the Low Countries, and though it is difficult to find exact analogies in history, it cannot be denied that the President of our Republic is somewhat in the position of the Stadtholders. The French ambassador, Du Maurier, in his curious memoirs, which have been used with much profit by Mr. Motley, tells us that Maurice of Nassau had some idea of making himself a king. He consulted Barneveld, and the great statesman told him that he could hold almost regal powers under the name of Stadtholder. The Dutch were, in Barneveld's opinion, somewhat averse to the establishment of a monarchy, but they had no distinct republican principles. France has monarchical instincts, but she has become estranged from the old line of French kings; she can have no king at present, so long as the representative of monarchy offends her love of equality, her hatred of priestly rule; but the Republic which has issued from this impossibility has purely negative characters; the love of the Republic is, I am almost ashamed to say, only intense among those who consider the Republic as the absence of all law, the gratification of all the violent passions of the human race, the revenge of poverty, of obscurity, of ignorance. Maurice of Nassau well understood that the commonwealth of the Low Countries, surrounded by enemies and by dangerous allies, divided by religious passions, required a strong hand to lead it; if he could not be a king, he could be a guide; he was the head of the army, and he soon became the head of the state. When the Chamber rose against M. Thiers, did the country rebel? There was no attempt in Paris or in the provinces to reverse the verdict of the Assembly. And what did the Assembly mean by giving the executive power to the head of the army, to a man who until then was only known by his courage, his energy, and his silence? The taciturn Marshal could often be seen at the Versailles Theatre, witnessing quietly the debates in which M. Thiers played so brilliant and so useless a rôle. He had slowly made up his mind; when he accepted power he was resolved to give it only into the hands of a king, or, if no restoration was possible, to keep it in his own hands. It was a futile hope to think that he would favor the establishment of a permanent Republic, when he had been placed in his office by all the enemies of the Republican party; he considers himself as the head of the Conservatives, but he will not allow the Conservatives to make any change in the tenure of office which they have given to him. For seven years he will repeat to them what he said at Malakoff, "J'y suis, j'y resterai." During these seven years he will be called the President of the Republic, but his power is really *sui generis*, he is a sort of elected constitutional king; he holds the executive power in trust for a number of years, and his difficulties arise only from the fact that while the term of this trust has been fixed, its real nature is still undefined. The Marshal cares perhaps little about the character of this trust, he only insists upon the necessity of a Second Chamber, upon the right of dissolution, and upon a new electoral law; but he feels keenly the necessity of some constitutional laws, as at present he is nominally still under the authority of the Assembly.

To place a man in the highest office of the state and not to say at once what will be the rights and duties of this office, is an imprudent act; but it was committed on the 20th November, when the law of prorogation was voted. I warned many of my friends, at the time, of the imprudence they were committing, but the prorogation law was passed with a sort of *furia* which would stop at nothing. The monarchical party felt so keenly the humiliation which they had suffered by the failure of the restoration scheme, they were so angry with the Comte de Chambord, and so afraid at the same time that Thiers would use his opportunity and seize the power again, that they jumped as it were with their eyes shut into the Septennat. The Chamber felt like a speculator who becomes alarmed about his fortune, and gives an order to a broker the consequences of which he does not distinctly perceive. The Legitimists were the first to see that they had unwittingly shut completely the door on the Comte de Chambord; if he should come now to France with the tricolor flag in hand, the Septennat would stop his way. The Bonapartists have been warned in their turn that they are not at liberty to plot against the Septennat. They may sell photographs of their young prince, or distribute them by the million, but they will no longer be allowed to preserve a secret organization—committees and sub-committees—which has ramifications in the army, in the police, in all the administrations.

The Marshal has come to the conclusion that his best friends are to be found in the old Constitutional party; his actual Cabinet is free from any ultra-Legitimist or Bonapartist elements. It seems as if after many attempts we had at last found what I may call the *color* of the Septennat—a régime which consists merely in the preservation of order and the execution of the law. In the present divided state of France, on the ruins of so many dynasties and republics, what else could be done? The Marshal is not a dictator; in the Senate of the Empire he alone spoke and voted against a cruel law called the law of general security (which better deserved the name of law of general insecurity); he distinctly told the Emperor Napoleon III., the first time he saw him, that he had cast his vote against him at the time of the election of the President in 1849. He is a man of conscience, devoted to his duties, modest rather than bold, but very resolute and firm in action; the army has much respect for him, and the army has perforce become a great power in a country where there are so many factions. After the suicide of the Comte de Chambord, it was easy to prophesy that the country had been too near a monarchy to proclaim immediately the Republic, and that some personal government would be founded. The forces which had brought back not only France but the House of Orléans to the idea of a Legitimist restoration, were anti-republican forces. These forces are now at rest; an equilibrium of seven years has been found; and it may be almost safely conjectured that France may have for a long time a succession of personal governments. It may be that our Stadtholders will be the unwilling founders of a republic adapted to the wishes and interests of the French people; it may be also that among them will one day be found one of those men who can only be satisfied with a regal or imperial title. One thing seems to me certain: France is getting accustomed slowly to the present régime, which is the reality of what M. Thiers once called the Republic without republicans; the very name of Republic inscribed everywhere will force the Government to be very conservative, and sometimes even illiberal; and it is not impossible that the Republic may be founded in fact in France by a man who never looked at the Republicans but with contempt, who was made a duke and a marshal by Napoleon III., and who was educated among the most fervid adherents of legitimacy.

Correspondence.

THE WISCONSIN METHOD OF RAILROAD REFORM.

To the Editor of the Nation:

Sir: That the *Nation* should be pig-headed when wrong, probably follows of necessity from its possession of certain admirable qualities which contribute most to its value and its success; and we who largely rely upon it to do our thinking on current topics, must put up with its little vagaries, and be thankful that it so seldom is wrong.

It is anent the Grangers and the railroads. Why the *Nation* should fail to do justice to the farmers I cannot see, but it does. Their grievances at the hands of the railroads it states fully and forcibly; but it appears unable to realize the effect on the human mind produced by such grievances as it describes, and it imputes to "a fresh outburst of dishonesty by which a certain portion of the community is infected as with the scrofula," a movement which is the legitimate result of "rings among the managers of roads; stock-jobbing on the part of the directors; dishonest secresy and equivocation in the transaction of business; corrupting influence on the State legislatures; corrupt discriminations made in freight charges; occasional raising of charges in the absence of competition, and occasional failures to lower them as much as the abundance of business would have warranted; and a general want of civility and of a spirit of accommodation among railroad officials."

In the face of such an indictment as this against the railroads, given in the words of the *Nation* (No. 472), one is at a loss to understand why it should seem necessary to attribute to innate dishonesty the uncouth flounderings which an unfortunate public makes in its efforts to escape from oppression. Nor is it dishonesty. In the case of Wisconsin, the discussion of whose railroad troubles called forth the expression to which I object, a business acquaintance extending to all parts of the State, and embracing farmers, business men, legislators, and professional men of all classes, and continued through the whole period of this active railroad discussion, impels me to declare that in all this acquaintance I not only find no evidence of any reckless desire to obtain relief at any cost, regardless of the rights of corporations, but I find abundant evidence of a contrary spirit. And it is on my return from a month's trip in that State that I find awaiting me the *Nation* for the four weeks in July, which contain sentiments which seem to me so unjust to the people with whom I have been mingling, that I cannot refrain from protesting against them.

There is a deep-seated feeling in Wisconsin, as in the West generally, that they are being thoroughly imposed upon by the railroads. And who shall say that it has no foundation? There is also a determination, equally deep-seated, to make these corporations feel that they are within the power of the law; and by legal enactments, the wisest they know how to frame, to secure the redress of those grievances which they firmly believe to exist. That the Wisconsin railroad law is unwise is probably true. But railroad men have only their own mismanagement to blame that any law whatever has been passed; and it is their own "dishonest secresy" that keeps from the public the information necessary to *wise* legislation. I can assure you that to secure the repeal of any part of the law that is unjust they have only to *show* that it is unjust, and in the meantime they are expected to submit to the legislation which their own misconduct has compelled.

The railroad question has been so thoroughly discussed at the West, that the community generally is much better instructed upon it than I suppose the general public at the East to be. The difficulty of dealing with it is well understood. Nobody claims to know what is right, or insists that the present legislation is final. But the sentiment is universal that a statute of some kind is necessary, and that, pending further light, the railroads must submit to what has been done.

I have said so much in defence of the *animus* of the railroad movement. Permit me a few words on two of the points in dispute.

1st. As to the justice of compelling corporations to submit to that provision of the Wisconsin constitution which places them entirely at the mercy of the legislature. I do not mean the legal *necessity* of submission, which I do not see how any one can doubt, but the absolute *justice* of it.

In a civilized state, the supreme power in legislation must rest *somewhere*, and the public must take the risk of its abuse. In Great Britain it rests in Parliament; and no one doubts that the British courts would enforce any act that Parliament might pass, whether just or unjust. If unjust, an aggrieved party could only appeal to Parliament for redress. In this country, there can be no question that this power is with the legislatures, under the State constitutions, except where expressly or implicitly given to the General Government. In Wisconsin, in railroad matters entirely within the State, there is happily no doubt that the legislature has full control. That this power is fearfully liable to abuse is too true. But where can it be placed better? Apparently, it must rest either with the legislatures or with the railroads themselves, and as between them certainly there can be but one choice. There is no other way. The railroads must take their chance of being oppressed; and the public must take their chance of being sold out by their servants. If either thing is done, an appeal to the people must supply the remedy. If this is wrong, the fault is in our form of government. Under that form, no other course is open. And does not the *Nation* very justly base all its political theory on the grand doctrine of the honesty of the majority? As to States not protected, like Wisconsin, by their constitution, is justice more likely to be done in them under the ægis of the Dartmouth College decision? If a corrupt legislature sells an oppressive charter to a railroad company, is it just that the doctrine of "vested rights" can prevent succeeding generations from repealing it? To what extent ought this generation to be able to bind posterity? To what extent will posterity probably submit to our entails?

2d. The *Nation* (No. 472), in the article above-quoted, says that reason for dissatisfaction exists in the fact that "rings among the managers of the roads, for the purpose of defrauding the company by making contracts with it, or furnishing it supplies above the market rates, had become shamefully common. So had the practice of stock-jobbing on the part of the directors. So had dishonest secresy and equivocation in the management of its business; but from all these things it was the *shareholders* who suffered."

Now, this is just the point in dispute. If the "shareholders" will adopt the *Nation's* view, and will adjust their demands accordingly, we can make short work of the railroad question. The public believes that the "shareholders" have been shamefully cheated by their directors, who have either wasted a large part of the funds committed to them, or have applied them to their own purposes, and have abused their trusts in the other ways described by the *Nation*. They understand further that the "shareholders" claim that they paid their money in good faith, and are entitled to interest from the first on the whole amount. On the other hand, the public insists that the delinquent directors were the agents of the shareholders, who must bear the loss resulting from their unfaithfulness, and that the charges must be adjusted to pay interest only on the necessary cost of the improvements. And the call now is for data necessary to determine the accuracy of the popular belief.

In so far as railroad funds *have* been misapplied, what is the opinion of the *Nation*? Ought tariffs to be adjusted to pay interest on such funds or not?

Edward F. Adams.

Chicago, August 5.

[About the *animus* of the Wisconsin people we have nothing to say, except that we think its expression in legislation is a more trustworthy indication of its character than any general testimony of individuals. Our indictment of the railroad corporations, of which our correspondent seems to approve, is one which has been repeatedly made in these columns, and was made long before the Granger movement was heard of. We should cordially support any attempt to deal with the evils which it sets forth. But no such attempt has been made. There is in the Granger movement thus far no sign of any such attempt. There is much empty talk by Granger agitators about "rings and combinations," but the one scheme of reform thus far produced by them consists in an attack on property, such as that in Wisconsin. With the "rings" and "combinations," and the "dishonest secresy and equivocation," and "the corrupting influence on State legislatures," no effort is made to deal, but an act is passed practically confiscating the property of the stockholders and bondholders, by compelling them to sell their wares at such prices as the purchasers, without enquiry, think "reasonable." In other words, the farmer's notion of railroad reform would seem, if one may judge from what has passed in Wisconsin, to consist in having himself and his baggage carried cheap. If the directors will do this, it would appear that they may cheat and equivocate and conceal and job and corrupt as much as they please. This is what the Potter law means, if it means anything. Of course, control over the railroads, as over all other interests within the State, must rest somewhere. There is nothing objectionable —on the contrary, there is everything that is commendable—in the resolutions of the Wisconsin constitution regarding charters. But when we say this we take it for granted that the legislature is and will be composed of civilized men, with the ordinary notions of the Western world regarding the sacredness of property. No legislature in Christendom has ever claimed or dared to exercise the power on which this Potter legislation rests, and which was confidently asserted by the State counsel in the first argument before the United States Court. The British Parliament, "omnipotent" though it be, has never put forward anything so monstrous. There is much talk in England of abating railroad abuses by the seizure of the roads by the state, but there has been no suggestion of this on any other terms than the payment to the stockholders of the market value of their shares. The doctrine that the right to "alter" or revoke a charter involves the right to confiscate the property created under it, is, as we have said, a brigand's doctrine. No matter what the provisions of the Wisconsin constitution may be, the legislature is bound to use its discretion under the fundamental canons of Western civilization. As the matter stands now, we can recall nothing resembling its action except the legislation of the Greek Parliament regarding the mines of Laurium.

Even if our correspondent's theory (that this action was caused by the rage generated by the ill-timed resistance and insolence of the railroad companies) be correct, we do not see that it mends matters. Most improvements in Wisconsin are made with the savings of foreigners and non-residents. These persons lend or invest their money in the State in reliance on the good-sense and integrity and moderation of the Wisconsin government. They take it for granted that the reasonable expectations of investors will not be arbitrarily interfered with; that charters inviting the subscription of capital will be granted in good faith and be honorably upheld; and that the State will do whatever is necessary to see that the corporations created by such charters are honorably managed. But if, whenever the directors of the railroads and the State legislature get into a quarrel, the legislature is capable of flying into a passion and inflicting a tremendous penalty on the stock and bondholders in order to punish the directors, we say unhesitatingly that such legislation is only worthy of Dahomey, and we tell investors at home and abroad that they cannot safely lend their money to a State which is governed in this way. The legislature has this year legislated in a passion against railroads; it may next year legislate in a passion against insurance companies or saw or grist mills, and the year after against mortgagees. There is never any telling what passionate people will do. A passionate legislature or a passionate majority is simply a mob acting under the forms of law. The Potter law is simply a mild way of doing what a mob does when it burns a station or tears up rails or throws locomotives off the track.

We receive every now and then intimations that if we talk of this, the Wisconsin people will get angrier and attack the railroads worse than ever. To which we reply, that we do not think this result wholly undesirable. The rise and growing impudence of the "practical man" in politics during the last thirty years has deprived all arguments drawn from the experience of mankind of much of their force in popular eyes, and, indeed, introduced among us one of the marks of barbarism—a disposition to look on conclusions drawn from each man's own little observations as safer guides than the strongest generalizations of history. The "bookmen" know perfectly well what the results of cheating the public creditors or capitalists or of inflating the currency are sure to be. But they have, as we saw last winter, the greatest difficulty in getting a hearing or influencing legislation. The West is now going through a craze about railroads in which the immediate petty interests of this year have assumed such control of the popular mind, that anybody who points out the probable effects of its goings-on upon its future prosperity is apt to be stigmatized as a speculator or the tool of a speculator; and it seems almost certain that any legislation on the railroad problem attempted in the present state of feeling will be mischievous. It would, therefore, we think, be most fortunate, and would greatly contribute to a rational solution of the problem hereafter, if Wisconsin or some other State would rush on and work out to the end what we have taken the liberty of calling the brigand mode of dealing with it. Its experience would be invaluable to the others. We confess, also, to having the deepest sympathy with the thousands, both at home and abroad, whose invested savings and securities such bodies as the Wisconsin Legislature are going to examine with the view of discovering the amount of interest which pure "justice" will permit them to bear. We assure them that in the present state of politics, and in the present moral condition of the politician, all schemes of this kind mean robbery at some stage or other; and as long as they are talked of, we mean to do our share towards putting investors on their guard against all borrowers and all enterprises of whatever kind in the States in which they are talked of. Until "the farmer" takes some less questionable step towards reform than announcing that he is part proprietor of all goods which he would like to buy cheap, he must make up his mind to hear unpleasant things from those who care nothing for his vote, and care a good deal about public morality. When strangers who have lent money to build Wisconsin railroads complain that the directors out there are cheating them, it is no answer for the Wisconsin farmer to say that they have cheated him too, and that he is going to get all he can out of them, and let the stock and bond holders go to the devil. The Wisconsin farmer is himself the State government, and it is his business not to begin thieving too, in a kind of sham despair over the general dishonesty, but to pass with all care and conscience such laws as will assure to every man who has any dealing with or in the State the satisfaction of all expectations which the State has sanctioned or encouraged.—Ed. Nation.]

Notes.

THE July number of the *Publishers' Weekly* consists entirely of an American Educational Catalogue for 1874, which includes, by the way, the publications of Macmillan & Co., Geo. Routledge & Sons, and other English houses having agencies here. The catalogue is classified, and the arrangement of works according to the authors' names.——G. P. Putnam's Sons publish immediately, in connection with the English publishers, Dorothy Wordsworth's 'Recollections of a Tour,' this tour being one made in company with Coleridge and Wordsworth through Scotland in 1803. The work is edited by Principal Shairp. Also, in their series of Elementary and Advanced Science, an 'Introduction to the Study of General Biology,' by Thomas G. MacGinley, and a 'Manual of Metallurgy,' by Wm. Henry

Greenwood.——While waiting for the appearance of the map of Africa in Stieler's Hand-Atlas, the smaller map prepared for his School-Atlas may be recommended to those who take a special interest in the geography of this continent. A proof-sheet of it is given in Petermann's *Mittheilungen* for June 25. The same number contains a reduced copy of the map of Captain Hall's Arctic explorations published by the Hydrographic Office, U. S. N. ——'Ritter's Geographisch-statistisches Lexikon' has reached the 6th part in both volumes, the publication of which goes on simultaneously (New York: B. Westermann & Co.) Apropos of this gazetteer, of which the first edition appeared in 1835, Dr. Keber tells a curious story in the *Mittheilungen*. The original conception was due to a certain Privat-docent of history in Halle, who broke down, however, in the early stages of the work, and was relieved by two brothers, theological students, whose perseverance was crowned with success. When the time came to fix upon a name for their venture they chose that of the father of scientific geography, and lived to have the assurance of a reviewer that "the name [of Ritter] is a sufficient guaranty of the excellence of the work"!——The newly-founded Geographical Society of Amsterdam follows the example of kindred bodies in maintaining an organ, and has just issued the first number of its *Tijdschrift*.——The numismatic collection of Mr. James L. Hill, formerly mayor of Madison, Wisconsin, is offered for sale up to October 1, proposals being received for the whole or for a part. The number of pieces is between 5,000 and 6,000, inscribed in nearly twenty languages. The most ancient medal mentioned in the catalogue (to be had of W. S. Main, assignee, Madison) is one of Alexander. We remark also the following, as more curious than rare, however: a silver medal of Venice surveying the map of conquered Greece (1687); the Massachusetts Pine-tree shilling (1652); nine small coins of Sedan (from 1642); and a white-metal medal—"obv. bust of Stonewall Jackson; rev. Bull Run, etc."—executed in Paris. In American coinage, Colonial and Federal, the collection is noticeably complete.——We have often alluded to the changes in the population of New England caused by the influx of Canadians. The intercourse between this country and the British Provinces is now or promises to become so intimate as to warrant the experiment of a newspaper devoted to its furtherance. We have before us the tenth number of an eight-page weekly published in Boston, called the *American Canadian*.

—The American Association for the Advancement of Science has held its annual meeting at Hartford during the past and present week. The most important business before the meeting has been the consideration and adoption of a new constitution, designed to remedy a long-continued evil growing out of the popular character of the Association. The scientific character of the papers and proceedings has very frequently been such as seriously to compromise the standing of the Association in the scientific world. To remedy this, it has been decided to select from the members those who are engaged in science and form them into a separate class of "Fellows." All the officers of the Association are now to be chosen from this class, and the power of the several committees to exclude improper or unsuitable communications has been increased. All friends of science will await with interest the working of this improvement. The necessity of some vigorous and effective measures must be obvious to any one who will simply examine the lists of papers presented for reading. Among some hundred authors, the number of really eminent men may be counted on one's fingers, while the large majority are entirely unknown, and present papers which, so far as can be judged from their titles, are of no scientific importance. We greatly doubt whether this evil will be cured by anything short of a radical change in the publishing system of the Association. So long as there is a volume of "proceedings" to be published, so long will there be a pressure on the part of the less desirable class of members to have their papers printed, and this pressure can be resisted only by a little more moral courage on the part of the Standing Committee than it has hitherto exhibited. While such papers are admitted, we may be sure that few of the abler members will wish their productions to be seen in such company. It is gratifying to notice that the present meeting exhibits a decided improvement in this respect, and that notwithstanding the general unimportance of the communications, the subjects of ether and atoms do not appear among those discussed before the Association.

—The discussion about the John Brown Song has brought out our contemporary, the *Methodist*, which does not pretend to original knowledge about any of the words except the chorus, but lays claim to the tune as good Methodist music, known in all the camp-meetings. The enemies of the Methodist denomination may see in this an additional proof of an old accusation against the brethren. This was to the effect that whenever anybody died who was at the same time a man of mark and of unknown "antecedents" as regards denominational creed, the brethren were apt in all kindness to make a "brevet Methodist" out of him. They were credited with having a good deal of zeal for the enlargement of the borders of the church, as indeed no follower of Asbury would deny; but the thoughtless among the world's people compared their eagerness in this respect to a well-known habit of the Irish mind, which no sooner discovers that somebody has made a name in the world than it discovers also that his descent can be traced to the Phœnicians. We imagine, however, that the John Brown tune will be left in the possession of our contemporary as undoubted Methodist property. Another writer coming to our assistance from Baltimore recalls the days when many years ago he used to hear at colored camp-meetings a song beginning thus:

"When this poor body lies mouldering in the ground,"

and which we suppose had also the proper chorus. And before it was adopted for use in Northern politics it had got into Southern. Our readers will remember the strength of the "Know-Nothing" or "American" feeling in Maryland Our correspondent says that in 1858, when Thomas Swann (American) was elected Mayor of Baltimore over Robert Clinton Wright, the song of the Plug-Uglies, who had paid the necessary attention to that election, began with the words,

"Robert Wright's body lies mouldering in the ground."

We are not told if the line following the thrice-repeated line had any reference to the soul. It will be seen, then, that the song may by possibility have had a negro origin—a fact which would have an appropriateness. The *Methodist* observes that when during the war a call was made for a national song, and a committee was appointed to select one, the John Brown Song was not sent in; and the writer ventures the assertion that had it been sent in it would have been rejected—which we have no doubt is a perfectly safe thing to say. A "call for a national song" is not exactly the sort of demand which produces supplies such as the song we know; nor is it usual that the gentlemen selected to form the committee on these occasions are favorites of the nine Muses. They are, on the contrary, much likelier to be taken by the glitter of such fabrications as Mrs. Julia Ward Howe's "Battle Hymn of the Republic," with its false ring in every line and word. But

"Mine eyes have seen the glory of the coming of the Lord"

was soon dead.

—Readers of the newspapers who have been made aware of the "celebration of the centenary of the discovery of oxygen" in the United States, have perhaps not noticed that in England also something of the same kind was going on. At Birmingham, at the unveiling of a statue of Priestley, Professor Huxley delivered an address in which he asked the patience of the audience "for a short time, while he laid before them the grounds and considerations which had led the fellow-countrymen of Priestley, after a lapse of seventy years from the time of his death, to do this honor to a man who was neither a prince nor a statesman nor a general, and was not, in fact, one of those to whom mankind generally delighted to erect statues, either before or after their death." This Professor Huxley proceeded to do in a very interesting manner, showing that it was not merely in honor of the discovery of a previously unknown gas that Priestley's memory was being celebrated, but also because he had been, in dangerous and tyrannous times, a fearless and honest searcher after truth, and a conscientious martyr to duty. In Professor Huxley's own words, "he took it that Priestley was of opinion that before he was a man of science he was a man in the first place, and a citizen in the second place." and Professor Huxley could himself "entirely sympathize with him if he held the duties of his manhood and of his citizenship to be vastly superior to those of his philosophership, and if he thought that the securing of that freedom which is the essential condition of the progress of science and the progress of the human race, was a vastly more important matter than advancing knowledge in this direction or that direction, vast as was the importance of that progress itself." In order to understand the importance of Priestley's labors for science, we have to carry ourselves back to a period (and it was only a hundred years ago) when "there was no one who believed, and hardly any one who suspected, that the doctrines of the ancients—that air, water, and fire are elements—was other than true"; and to understand the courage of Priestley as a political and religious reformer, we have to recollect that he was a dissenter, and a Unitarian, and a political liberal, at a time when "his preaching was a crime"; when "every Sunday during which he abstained from going to a service which he abhorred he could have been visited by a fine and imprisonment"; when "society was in a state of corruption which could only be compared to that of the Second Empire in France"; and "when bribery was the means of government, and peculation its reward"; when "four-fifths of the seats in the House of Commons were

notoriously for sale in one shape or another"; and when "the minister required to know the state of the vote market more than any other." Whatever opinions one may hold nowadays about the perfectibility of mankind, Professor Huxley thinks no candid person can deny that the world is better off than it was in the "dead waste and middle of the eighteenth century," as Lowell calls it somewhere; and that we are improved in knowledge and liberty is in no small measure due to Priestley and his fellows.

—We find the following paragraph, copied from the English journals, circulating widely in ours:

"In preaching at Westminster Abbey, the Bishop of Lincoln said that cremation would, he believed, imperil the doctrine of the resurrection, and so produce the most disastrous consequences."

One would be inclined to disbelieve the statement entirely were it not that substantially the same idea has been frequently expressed both in this country and in England. It is really extremely difficult to understand the condition of an educated mind in which such a notion finds lodgment; and the fact that it does find lodgment and expression is a very strong argument for a more general diffusion of scientific education. Can it be supposed that a matter so important as the resurrection of the body is deemed to be, has been left dependent upon accident or upon the caprice of men in the method of disposing of the bodies of the dead? Does the Bishop of Lincoln imagine that Latimer, Ridley, Cranmer, and all the other martyrs of the stake are to exist for ever in some disembodied state, while their less deserving brethren who were more fortunate in the method of their death inherit that glorified body of which St. Paul speaks? How, too, with Wiclyffe, whose remains are reported to have been burned years after his death? Do not these gentlemen (the Bishop of Lincoln and others) know that, scientifically speaking, the results of burning and of slow decay are precisely the same—viz., the resolution of the body into its constituent elements; indeed, that the processes are so nearly identical that Liebig gives to decay the name "cremacausis"—slow combustion—and points out the identity of the operations in everything except time? It would hardly seem necessary to explain, even to those clergymen who always speak of science as "science falsely so-called," that by either process no particle of matter is lost or destroyed. If then the problem involved were the restoration of the body destroyed, the constituent elements to be brought together would be the same in either case. But St. Paul distinctly points out that his doctrine does not call for any identity of substance, likening the change to the germination and growth of grain, in an analogy as clear as it is beautiful. The theologic ignorance, therefore, displayed by these timid persons, in so far as they are clergymen, would seem as disgraceful as the scientific ignorance is lamentable. We do not mean by what we have said to express any opinion in regard to the practice of cremation or the doctrine of resurrection, but simply to point out that they can have no connection with each other.

—The inherent defect of the trades-unions, by which the skilled and the unskilled, the lazy and the industrious workmen are merged together instead of being sharply discriminated, is a defect of principle, and must of necessity come to grief in the long run. It is best met by insisting rigidly upon the opposite principle. One of the largest shipbuilders in the United Kingdom writes to Mr. Brassey, M.P. (who prints the letter in a late number of the *Contemporary Review*), that in 1868 there was no piece-work done in his establishment, but that since that date he has been steadily introducing it, till now it is the rule for the iron department and blacksmith work, and time payments are no longer more than one-half the total. This "payment by results," as he calls it, put an end, in the first place, to the trouble formerly experienced in procuring skilled iron hands. Those who were retained worked all the harder, and added their ingenuity to that of their employers to save unskilled labor by the introduction of machinery. As a consequence, the skilled and the unskilled men now earn from 50 to 75 per cent. more than they did, while the work per ton of iron in the ships is about 20 per cent. cheaper; "and, from a much smaller number of men being required, the supply is approximately equal to the demand." Moreover, since the introduction of piece-work, it has for the first time been possible to estimate to within a fraction what the iron and blacksmith work will cost. The product of the yard in 1868 was steamships aggregating 13,000 tons; in 1870, 18,500; the number of hands in the former case, 1,776; in the latter, 1,550. "In 1868, the average wage earned per week of 60 hours was about 17s. 1d.; in 1873, per week of 54 hours, about 22s. 9d. In 1873, the cost per ton, gross new measurement, in wages only, was fully 20s. cheaper than in 1868, but this reduction is due to the piece-work departments. Finally," says the writer, "the piece-work system keeps us clearer of disputes and trouble with our men than we were under the old method; and men and employers alike make a better result. I look to 'payment by results' as a system calculated to put an end to many trade disturbances; but trades-unions are opposed to it."

—The flight of Marshal Bazaine from Ste. Marguérite lends decided interest to an account of a recent interview with him which we find in the Milan *Perseveranza* of July 29. The Paris correspondent of this journal writes that an intimate friend of his, an Italian, who had been in the French service in Africa and, under Bazaine, in Mexico, made extraordinary efforts to visit the General in his confinement, and, at length, towards the end of May, succeeded in obtaining permission of the Minister of the Interior. On reaching the island he was directed to the official who was responsible for the custody of Bazaine; a civilian as it proved, and not the commander of the garrison, since it was feared the latter might be influenced even unconsciously by one who had been his superior officer. The Italian visitor, showing his permit, begged to see Marshal Bazaine, but was promptly informed, in the spirit of '93, that there was no such person on the premises; there was, however, a *Monsieur* Bazaine. This punctilio satisfied, the interview was allowed to take place, and the Italian was conducted to the low barracks, built out on one side to the precipice overlooking the sea, on the other facing a narrow esplanade, some twenty by fifty yards in area, the limit of freedom for the Marshal and his family of six. The conversation between the state prisoner and his former comrade in arms is not reported in full. Bazaine enquired what progress the Italian army was making, and asked after several of the generals whose acquaintance he had made in the campaign of '59; and added that if his lot should undergo a change (*se la sua sorte cangiasse*), he had a mind to settle in Italy with his family. "Does Bazaine hope to escape from Ste. Marguérite?" asked the correspondent of his friend. "He did not tell me," was the reply; "but he seemed to me to believe that the French authorities might shortly be disposed to mitigate a punishment which involved not him alone, but also his entire family. Perhaps he has hopes of being exiled." The event shows that Madame Bazaine's hopes at least were of exile, though not through banishment. Did the Marshal leave behind him the memoirs with which he occupied his enforced leisure?

—Vol. I. of a work important to students of chess literature and to lovers of the game has just been published by Julius Springer in Berlin (New York: B. Westermann & Co.): Antonius van der Linde's 'Geschichte und Litteratur des Schachspiels.' It is a fine large octavo of 576 pp., illustrated with 415 diagrams, and traces the history of the game from its origin in India down to the year 1795, when the first part of Allgaier's 'Anweisung zum Schachspiel' was issued. We reserve an extended notice of the book for a later number, premising, as an indication of the thoroughness to be expected from the work, that the author has been able to consult all but one of the more than 200 noted treatises on the game—the exception being a Spanish work, F. Vicent's book of problems, published at Valencia in 1495, and perhaps, as the publisher's circular says, not now existent. The author has naturally paid much attention to the bibliography of his subject, and has been helped here by the experience gained from previous bibliographical labors in this and other studies. The chess problems of the Middle Ages, more than 2,500 in number, preserved in Arabic, Latin, Spanish, Old French, Italian, and German texts, Van der Linde has reduced to 372, all of which he reproduces in this first volume. Another volume will follow; and, as all the manuscript is in the hands of the printer, Vol. II. may be expected confidently and with pleasure before the end of the year.

RECENT POETRY.*

I.

OUR American market has not been very fully supplied with poetry this year, whether domestic or reprinted from foreign authors, but it has nevertheless presented a goodly array of volumes. Among these the first place has been easily taken by George Eliot's 'Legend of Jubal,' and Lord Lytton's 'Fables in Song.' The former had a peculiar interest as challenging the public to a second judgment on its author's claims to attention as a poet. The first judgment, rendered after consideration of 'The Spanish Gipsy,' was not of a character to satisfy an ambitious author. The work was read with respect, and it was decorously praised in the critical journals; but the praise was no more than decorous, and a poem that is read with respect and without delight is not a work with which to make one's advent as a candidate for the bays. In short, 'The Spanish Gipsy' was an interesting performance, but as proof of genuine poetical powers in the writer it was not successful. The same thing may be said of this 'Legend of Jubal.' It is wise, it is witty, it contains poetical thought

* 'The Legend of Jubal, and Other Poems. By George Eliot.' Boston: J. R. Osgood & Co. 1874.
'Fables in Song. By Robert, Lord Lytton.' Boston: J. R. Osgood & Co. 1874.

and sentiment, it shows mastery of several people's methods of poetical expression, but it is seen to be George Eliot's prose, and not to be poetry. The reader everywhere is made to feel the painful limitations of the moralist, and the female moralist at that; and the female moralist to whom life (or, as one may better say, certain lives as she can contrive to look at them) appears to be a dreary mistake and failure. There is never any clear escape from positivism duly cultured, and the great law that sin corrodes character, and the great law that individual aspiration is futile, and the various other laws which George Eliot, the novelist, has inculcated with so much force and skill. We are always really in the hard world of prose and fact and necessary sequences, and never in the atmosphere of "a fuller and larger existence," such as the poets give. The result is that the reader is somewhat depressed, and that by-and-by he refuses to allow George Eliot a rank among the poets, just as formerly he grudged her a really first place among great novelists. The wonderful degree of the feminine power of observation which she possesses, her great humorous power, her philosophizing, often so acute—all still left him saying at the end, This is very remarkable; perhaps the author of 'Waverley,' for instance, could not have done the half of it; but there is a thing called life, the life of men in this world, which is more than meat and raiment, and more also than the most skilfully-contrived and elaborately-thought-out schemes of moralized existence that can be made for us by the cleverest of philosophizing women. A sense of this, whether due to a masculine breadth of view arising from a wider experience of life and its opportunities, or a masculine feeling of courage and energy which does not busy itself much with theories of the universe, the reader will not miss in the poorest of Scott's novels. We are mistaken if even George Eliot's power of humorous observation will blind a second generation to her failure in this respect, and her venture into the field of poetry pure and simple has not had the effect of deferring the discovery that her wings are of the ostrich kind, and that she cannot lift herself from the ground.

'The Legend of Jubal' gives its name to the book, but is neither the most important nor the most pleasing poem of the volume. The latter praise will be given to the set of sonnets which treat of the affection which a little girl feels for her brother—or rather of the affection which she felt for him long ago, and upon which she now looks back with fond remembrance. She sees it in a frame of old scenes, and of old scenes which, as she now perceives, she gazed at with the wondering and wonder-making eyes of childhood. All this is very pretty. George Eliot had previously shown her appreciation of the brotherly and sisterly relation, and it is with a sincere pleasure that one contemplates her as "the little sister" which she tells us she would like to be could she be born into a new world of childhood. We make room for one of the sonnets, so to call them:

"I cannot choose but think upon the time
When our two lives grew like two buds that kiss
At lightest thrill from the bee's swinging chime,
Because the one so near the other is.

"He was the elder and a little man
Of forty inches, bound to show no dread,
And I the girl that puppy-like now ran,
Now lagged behind my brother's larger tread.

"I held him wise, and when he talked to me
Of snakes and birds, and which God loved the best,
I thought his knowledge marked the boundary
Where men grew blind, though angels knew the rest.

"If he said, 'Hush!' I tried to hold my breath;
Wherever he said, 'Come!' I stepped in faith."

In a different vein and suggestive of our authoress quite grown up is the poem called "A Minor Prophet," which trenchantly analyzes a reformer of the long-haired variety:

"I have a friend, a vegetarian seer,
By name Elias Baptist Butterworth,
A harmless, bland, disinterested man,
Whose ancestors in Cromwell's day believed
The Second Advent certain in five years,
But when King Charles the Second came instead,
Revised their date and sought another world:
I mean—not heaven but—America."

The 'Legend of Jubal' teaches that the pursuit of art and the service of one's fellow-men must be allowed to be their own reward. Jubal invents all sweet instruments of sound; then wandering away he is absent for years, but returning in his patriarchal age, and hearing men play his music and praise his name, he announces himself as the creator of the lyre; upon this he is derided and denounced:

". . . . . Two, the most devout,
In honor of great Jubal thrust him out,"

and he is left for consolation to the thought which is the key-note of the poem.

Lord Lytton's 'Fables in Song' is a book of the usual embarrassing sort turned out by this author, and the knack of producing which he inherited legitimately from his father before him. It is so elaborate in its scheme, the author appears to have so grave a belief in his own capacity and in the sufficiency of his work, that the reader is bothered by the necessary doubt whether there may not be something in it all, and whether he was right in thinking the writer undeserving of serious consideration. Something there doubtless is in it; but we have found it small in amount and of a thin quality. The book is a book of fables. That is to say, Lord Lytton's notions on a thousand-and-one topics, literary, social, political, what-not, are set forth by means of interlocutions between all sorts of objects, animate and inanimate. It will be seen that this is giving to the word fable a wide definition, but we do not know that anybody need object, especially as Lord Lytton might have if he liked written us a philosophic prefatory treatise on the nature of the fable and the truly artistic mode of employing it. Of the views and opinions thus offered us, some are new enough or well enough illustrated to make the poem expressing them a clever and agreeable piece of work; others of them are of such weight as attaches to the opinion that the rabble should not rule, expressed with the profuse verbosity of which our author is a master. We give a fair specimen—selected in part, however, for its mere brevity—of the better class of these effusions:

A PROVISION FOR LIFE.

A pine-tree bless'd its favor'd fate, because
Room to grow barely 'twixt the grudging jaws
Of one of the chapped sandstone's gravell'd flaws

It found: where early chance had cast its lot
On a bare rock, with leave to thrive, or not,
As later chance might choose, in that chill spot.

"Ah, what good fortune!" sighed the grateful tree,
"That in this fissure the wind planted me!
But for its inch of earth, what should I be?"

Fool! Thy good fortune was not the bestowing
Of that scant handful of earth's overflowing.
It was—and is—thy faculty of growing.

HENRY THOMAS COLEBROOKE.*

SEVEN AND THIRTY years have elapsed since the death of the eminent scholar whose biography and essays lie before us; and yet, assiduously and successfully as the subjects which employed his pen have, of late years, been prosecuted, research and criticism have found little to amend in his statements, or to invalidate in his conclusions. Alike for amplitude of investigation and for keenness and impartiality of judgment, he is still revered, by Orientalists, as a model all but faultless. Nor is it surprising that he should be thus signalized. The fact is, that, explore literature as widely as we may, we shall hardly discover a better exemplification of rigidly scientific method than is uniformly exhibited in his numerous and multifarious disquisitions.

Henry Thomas Colebrooke, youngest son of Sir George Colebrooke, the first baronet, was born in London in 1765. From the age of twelve he spent several years in France; and in 1782 he sailed for Calcutta, having been appointed to a writership in the Indian Civil Service. Though, almost at the very beginning of his career, he displayed the same industry and energy by which it was subsequently distinguished throughout, it was some time before he grappled triumphantly, after repeated attacks and retreats, with the study of Sanskrit; and his first substantive publication, dated in 1795, was a treatise, written in concert with Mr. Anthony Lambert, on the husbandry and commerce of Bengal. Early in the preceding year, however, the first of his invaluable essays was read, in the presence of Sir William Jones, before the Asiatic Society, which he had joined in 1792, and was afterwards contributed to the 'Asiatic Researches.' His rapid rise to the highest judicial position in India was due, in large measure, to his unrivalled intimacy with the original fountains of Hindu jurisprudence; but, sedulous as he must have been to attain that intimacy, he contrived to find leisure, simultaneously, not only to slay many a tiger, but to examine competently well nigh the entire range of Hindu literature. In 1810 he married Miss Elizabeth Wilkinson, who died in 1814, one of their three sons having died before her. Two months after losing his wife, he resigned his appointments and returned to England. With the exception of some months given to a trip to the Cape of Good Hope, the remainder of his life, until he was disabled by various infirmities, was spent in unceasing literary and scientific activity. For several of his last years he was never free from pain, and was unable to leave his bed; and for a still longer period he was afflicted with total blindness. It was then that the stoicism of his vigorous nature, which had always been more or less obvious, announced itself with noticeable dis-

* 'Life and Essays of H. T. Colebrooke.' 3 vols. London: Trübner & Co. 1873.

tinctness; for he was rarely heard to complain. The death of his eldest surviving son, a young man of remarkable promise, was the last and the heaviest of the many domestic afflictions which he suffered in his old age. The father at last succumbed to a complication of maladies on the 10th of March, 1837.

For details such as alone will suffice for forming a just estimate of Colebrooke, either as a man or as an author, we must refer to the excellent biography for which we are indebted to his son. He was never at any school, but pursued his studies at his father's house, under a tutor; and we are told, that, when only fifteen, he was well advanced in his knowledge of Greek, Latin, and mathematics, not to speak of his perfect familiarity with French, and some proficiency in German. That his mind matured very early is evident from the letters which he sent to his parents from India, while he was still in his minority. Once reconciled to his new home, but not till then, he long devoted a continuous attention, yet not exclusively, to the learning of the Brahmans. In naming law, religion, philosophy, astronomy, algebra, geometry, grammar, lexicography, and inscriptions, we may convey some idea of the wide range of topics for information on which he pored, during many years, over the dreary diffuseness and the knotty obscurities of Sanskrit literature and science. With all the subjects just enumerated he has dealt, either in dissertations or in translations, and, as to law, in volumes of formidable dimensions. But he was also a profound and advanced politician, a sound political economist, a zealous botanist, geologist, zoölogist, and orologist, and an observant and instructive traveller. Many, we suspect, who know him solely as the greatest of English Sanskritists, have not even heard of his work on 'Import of Colonial Corn,' of his 'Treatise on Obligations and Contracts,' drawn chiefly from the records of Roman law, or of his monographs on 'Frankincense,' 'The Camphor-tree,' 'The Height of the Himalaya Mountains,' 'The Dichotomous and Quinary Arrangements in Natural History,' or of his 'Hypothesis to account for the Variable Depth of the Ocean,' or of his 'Speculation concerning the Structure of the Earth.' Many-sided indeed, and altogether noteworthy, must be the man who, stepping aside from the specialty for which he stood pre-eminent, could discourse on matters so heterogeneous as these, especially if he discoursed on them, as Colebrooke discoursed without fail, in a way that challenged serious and respectful consideration.

Two volumes of 'Colebrooke's Essays,' selected by their author, were passed through the press by the gifted Friedrich Rosen in 1837. Except to an insignificant number of readers, they then possessed but slight value. Few periodicals of the day acknowledged their existence; and a large part of the impression was destroyed as waste-paper. But the times have greatly changed, since 1837, as regards the interest felt in Orientalism. There must now be thousands of persons, in Europe and America, to whom the work in question will be, henceforth, an indispensable companion. A new edition of it was projected, a few years ago, by Mr. Fitzedward Hall, at whose instance Sir T. E. Colebrooke has expanded into a goodly volume the slight memoir of his father published just after his death. Another of our countrymen, Professor W. D. Whitney, was associated in the undertaking, which ultimately had to be abandoned; and the searching notes which he has contributed to Colebrooke's 'Essay on the Vedas,' lead us to regret that some of the other essays, and, above all, those on Hindu Astronomy, should not have been enriched by his annotations. These annotations Professor Whitney would only have had to collect from the somewhat inaccessible corners where, in years past, he secluded them; and Colebrooke's latest editor, in satisfying himself with little more than bare references to the facts, arguments, and demonstrations by which Professor Whitney has set aside not a few of Colebrooke's deductions, compels some qualification of our otherwise entire approval of the manner in which he has discharged his functions. Without recognition, accompanied either by adoption or by argumentative rejection, of Professor Whitney's conclusions touching the Hindu asterisms, no future treatment of them can evade the imputation of reprehensible defect. The present edition of Colebrooke's Essays was executed by Professor Edward B. Cowell, a scholar of universal accomplishments, and the most distinguished of living English Sanskritists. His notes, corrective and supplementary, are derived from almost every relevant source, are commendably copious, and are never superfluous. Professor Cowell is to be thanked for having rescued from oblivion the six articles by which he has amplified his edition of the essays beyond the matter of the first. But Colebrooke's reply to Bently should have been given unabridged, if at all, and, rather than as a bare text, with full comments. The reader should be warned, too, that the statement made as to Professor Whitney's views regarding Biot's absurd theories is not wholly accurate.

Manual of the Constitution of the United States. Designed for the Instruction of American Youth in the duties, obligations, and rights of Citizenship. By Israel Ward Andrews, D.D., President of Marietta College. (Cincinnati: Wilson, Hinkle & Co. 1874.)—President Andrews states in his preface that this work grew out of the researches which he found himself compelled to make in order to prepare himself for the duties of the class-room; but that "a conviction that a knowledge of our government cannot be too widely diffused, and that large numbers would welcome a good work on this subject, has led to the attempt to make the volume a manual adapted for consultation and reference by the citizen at large." There is a third function of this Manual which also deserves to be pointed out, and that is the instruction of foreigners as well as of native citizens in regard to the nature and historic development of our institutions. In each aspect of its usefulness, the work cannot fail to meet with approval, and as a text-book it is by all odds the best of its kind. We hope that every effort will be made to introduce it into our schools and colleges, and that the editor and his publishers will at least once in five years revise it in accordance with the changes which our machinery of government is constantly undergoing. The plan of the Manual renders such a revision easy.

The Constitution is too apt to be regarded (if not taught) as a definite and self-interpreting instrument, and arguments as to what is and what is not constitutional are usually conducted as if the gravest questions could be settled by any one who had a good memory of the text, or who had access to an index or concordance to our national charter. Ideas like these are effectually dispelled by the Manual, which records in detail the organization and growth of each department of the Government, and shows the Constitution to be something more than the skeleton framework of '87 plus a certain number of amendments, by tracing the legislation which has given its provisions their practical effect, the judicial decisions which have defined its scope, and the vast political and social revolution which cast out sectionalism and slavery together, and ensured not only "a more perfect Union" but for the first time a truly republican form of government—of, by, and for the people. In this view the Constitution is seen to be a living, ever-varying manifestation of the public will; and what is constitutional at any given time is to be ascertained by reference to the latest acts of Congress and the latest opinions of the Courts upon the subject under discussion. For instance, it is constitutional not only that the senators from each State shall be "chosen by the legislature thereof" (Art. I., Sec. 3, clause 1), but on the second Tuesday after the meeting and organization of the legislature, or, in case of vacancy occurring during the session, on the second Tuesday after they have had notice of the vacancy (Act of July 25, 1866).

We have not room to specify those discussions of the Manual which have an immediate and current interest. They embrace the most recent political events, such as the "back-pay grab," concerning which it is remarked that every act of Congress to increase its own pay has been retroactive, and that "all the acts prior to that of 1866 were separate and independent acts; but the one of 1866, and that of 1873, were sections in appropriation bills"—an important and not the only distinction. The question of legal-tender is soundly treated, though the second decision of the Supreme Court is not quite exactly stated; and the nature of the "present Government paper, circulating as money," is clearly set forth. "If," says President Andrews, in a chapter which may not recommend his Manual to some Western school committees, "the Treasury notes in the hands of the people are veritable money, as truly so as gold, then the United States is not indebted to those who hold them any more than it is to those who have gold eagles in their possession; and the Treasury Department should not report these Treasury notes as a part of the national debt."

A few trifling errata have fallen under our observation. On p. 50—"The Constitution does not require the representative to be a voter"—*voter* seems to be printed for *native*. Page 104, "the coinage act of 1853" stands, we presume, for that of February, 1873. In studying the history of representation and direct taxation under the Constitution, some confusion might be caused by the statement on page 52 regarding the three-fifths rule:

> "The adoption of this rule was favorable to the slave States, as it increased the number of their representatives; it was unfavorable as it increased their proportion of direct taxes. The advantage was greater than the disadvantage, however, as they enjoyed the increased number of representatives continually, while direct taxes have been levied but five times since the adoption of the Constitution."

Now, it is true that a greater proportion of taxes had to be borne by the white population of a slave State, as compared with the white population in any non-slaveholding State; but, the slaves not being legal persons, any capitation tax based on total population must have fallen entirely upon their owners, had it not been for this express relief of two-fifths in the census. Regarding the white slaveholding community by itself, therefore, there was no "disadvantage" and really no "increase" whatever. The rule was, in fact, of their own concocting; they fortified it by Art. I., Sec. 9, clause 4,

as is duly noted on p. 150, and secured this last clause against amendment prior to 1808 (Art. V.); and, finally, threw all their weight in favor of indirect taxation—a policy, by the way, which naturally had the effect of preparing the country to receive the doctrine of protection, though the South has never had her responsibility for it brought home to her.

BREAD LOAF INN! Ripton, Vermont. Welcome to all!

THE WEEK IN TRADE AND FINANCE.

NEW YORK, August 17, 1874.

MONEY continues to be abundant on call at 2 to 2½ per cent., and on time at 4 per cent. for 60 days and 7 per cent. for the balance of the year. In commercial paper there is a limited amount of business doing; the rates on prime dry-goods endorsed paper are quoted 5 to 7 per cent. for that having from 60 days to four months to run.

The statement of the Clearing-House banks on Saturday was unfavorable. The loss in specie reflects the shipment of gold last week to Europe. The total reserve is down $3,359,400. The total reserve required by law is $59,478,875, and the banks hold $88,930,100, or $29,451,225 more than the legal requirement. The surplus reserve last week was $31,724,100, so that there has been a decrease this week of $2,272,875.

The following is a comparison of the averages for the past two weeks:

	August 8.	August 15.	Differences.	
Loans	$280,534,300	$279,250,200	Dec..	$1,284,100
Specie	25,740,000	22,352,000	Dec..	3,388,000
Legal tenders	66,549,500	66,578,100	Inc...	28,600
Deposits	242,261,600	237,915,500	Dec..	4,346,100
Circulation	25,805,700	25,809,100	Inc..	3,400

The following shows the relations between the total reserve and the total liabilities:

	August 8.	August 15.	Differences.	
Specie	$25,740,000	$22,352,000	Dec..	$3,388,000
Legal tenders	66,549,500	66,578,100	Inc..	28,600
Total reserve	$92,289,500	$88,930,100	Dec..	$3,359,400
Reserve required against deposits	60,565,400	59,478,875		
Excess of reserve above legal requirem't,	31,724,100	29,451,225	Dec..	2,272,875

The stock market during the week has remained in its usual state of quietness, and the "Street" has apparently become quite reconciled to this order of things. The suits now going on at Madison, Wisconsin, which have from the first affected the market, have caused a feverish feeling in Milwaukee and St. Paul and Chicago and Northwestern, according as the reports which have come to hand indicated this or that result of the cases brought before the court. The arguments in the different suits have been closed, and as yet no decision has been rendered, but as the point to be decided is in regard to the jurisdiction of the State Court to issue an injunction, the decision may be in favor of or against the railroads without settling the main question as to the right of the State to regulate by law the tariffs of the roads. It is expected by many that the fall will bring about a more active business in stocks, and they look forward to largely increased railroad earnings as compared with those of last year; should such be the case, it is probable that stocks will advance, starting as they will from a very low basis.

In the investment stocks the chief event of importance was the sharp decline in Chicago and Alton, which was caused by an extensively-circulated report that the Company would probably cut down it susual 5 per cent. six months' dividend to 4 per cent., and that possibly no dividend whatever would be paid. The common stock dropped to 99, and the preferred to 103. Subsequently, when it was officially announced that the directors had declared the usual 5 per cent. dividend, the price of the common advanced to 103½ and the preferred to 108. Chicago, Burlington and Quincy has been in good demand, under which the quotation has risen to 107½ bid, and none offered under 110. The largely increased net earnings of the Chicago, Burlington and Quincy place its ability to pay the usual 5 per cent. semi-annual dividend entirely out of question.

The following shows the highest and lowest sales of the leading stocks at the Stock Exchange for the week ending Saturday, August 15, 1874:

	Monday.	Tuesday.	Wed'day.	Thursday	Friday.	Saturday.	Sales.

The transactions in Government bonds have been limited to the amount sufficient to supply the small current demand from investors. The Syndicate have disclosed none of their plans in placing the new 5's recently taken from the Government. It is said that the Rothschilds have determined to make the negotiation a success, not only as a business transaction, but to show what a great house can do.

The following were the closing quotations of Governments this evening:

	BID.	ASKED		BID.	ASKED
Registered 6's, 1881, c	118¼	118¾	Registered 5-20, 1867, c	117⅝	117¾
Registered 5-20, 1862, c	111¾	112¼	Registered 5-20, 1868, c	117⅞	118¼
Registered 5-20, 1864, c	115⅝	115⅞	Registered 10-40's, c	113¾	113⅞
Registered 5-20, 1865, M and N.	116⅞	117¼	Registered 5's of 1881	111¾	112¼
Registered 5-20, 1865, J and J.	116¼	116½	U. S. Currency 6's	117½	118

The gold market has been weaker than it was last week, when the advance of 1 per cent. in the Bank of England discount rate and the increased specie shipments imparted a strong feeling to the premium. The range of fluctuations has been between the limits of 109½ and 110.

The following shows the range of quotations for every day during the week ending on Saturday:

	Opening.	Highest.	Lowest.	Closing.
Monday, Aug. 10	110	110	109⅜	109⅜
Tuesday, Aug. 11	109⅜	109¾	109⅜	109⅝
Wednesday, Aug. 12	109⅝	109⅝	109⅜	109⅝
Thursday, Aug. 13	109⅝	109⅞	109⅝	109¾
Friday, Aug. 14	109⅝	109⅝	109⅜	109⅝
Saturday, Aug. 15	109⅝	109⅝	109⅜	109⅜

The specie shipments for the week amount to $2,032,733, of which $1,499,000 consisted of gold coin.

SPECIAL NOTICES.

TERMS: In advance, one insertion, four cents per word; five insertions, three cents per word, each. The enclosure of a stamped and addressed envelope will secure a numbered box, to which communications may be addressed.

A Vassar Graduate of three years' experience in teaching, desires a situation in a select school. Refers to the Faculty of Vassar College. Address, Box 15, *Nation* Office.

A Vassar Graduate, an experienced teacher, desires a re-engagement. Address Box 12, *Nation* office.

School of Mines, Columbia College.— Courses in Mining and Civil Engineering, Geology, Mineralogy, Chemistry, Assaying, etc., etc. Send for catalogue. C. F. CHANDLER, Dean of Faculty, East Forty-ninth Street, New York.

Yale College—Law Department. Address PROF. FRANCIS WAYLAND, New Haven, Conn.

Sheffield Scientific School of Yale College. Information by addressing Prof. G. J. BRUSH, New Haven, Ct.

The Nation.

NEW YORK, THURSDAY, AUGUST 27, 1874.

The Week.

THERE has been a good deal of rioting and lawlessness in the South during the past week; the principal affrays having taken place at Lancaster, Kentucky, and Georgetown, South Carolina. In the latter place, a feud has been raging a long time between two advanced thinkers, both black, named Jones and Bowley. In Lancaster, on the other hand, the principals in the affair, Sellers and Kennedy, were white. The negroes were involved in the latter fracas, and an equal number of whites and blacks seem to have been killed or wounded; order was restored only on the appearance of troops. The Georgetown ringleaders were both men of Northern birth, being described as "negro carpet-baggers"; Jones being a State senator, holding office till 1876, who has made a good deal of money, which he spends lavishly, and in return gains much popularity in the rice-field. Bowley is described as being also rich, his wealth being explained by the fact of his having been chairman of the State committee of ways and means. One of the charges against him is that he made a good deal of money by refusing to report the appropriation bill unless he secured a commission of ten per cent. on the amount; but Jones is said to be really the more intelligent man, and, being a colonel of the National Guard, he had a clear advantage, which in the end he maintained.

The Alabama Republicans have held their convention and passed resolutions disclaiming all desire for "social equality," and at the same time rejecting the "issue of race against race" "tendered us by the Democratic party." They declare that they only demand for the negro "equal advantages," and that the Republican party in Alabama "does not desire or seek mixed schools or mixed accommodations for the colored people"; that "no civil law can or should invade the line of social exclusion that society gave us by laws more inexorable than statute or common law"; that the laws ought to be enforced in all cases. There are also conservative resolutions as to the State debt and the relations of the State to the indebtedness of private companies.

The election in Alabama will be of importance because the State, though now in the hands of the Republicans, is said to be certain to go Democratic at the next election. A correspondent of the Cinnati *Commercial*, who has travelled a great deal in the South, says that in the northern part of the State, which was the stronghold of the party, the Civil-Rights Bill has had a very unfortunate effect on it; and as the whites outnumber the blacks, there can be no doubt of the result. In South Carolina, the Congressmen and both Senators have declared themselves against Moses; and Judge Mackey, who has been recently to Washington to discover Grant's real feelings on this subject, has returned and reports that the President is greatly excited, declaring all Republicans in the State responsible for the robberies, and that he "would continue to hold them responsible unless they 'reformed at the ballot-box.' And," continues the Judge, "while the President speaks calmly of all the great battles he fought, or the most stirring events of the war in which he participated, yet when I talked to him of South Carolina, his apparently pulseless lips quiver, his veins and his eyes enlarge, and he says, 'You must stop the robbery.'" Mackey was a Moses man during the last campaign, but now says that as he has received a "field order" from Grant to suppress this robbery, he must assist in the work of reform, cost what it may. Moses has been delivering a long speech in vindication of his course, in which he undertakes to prove that his administration has been more economical than that of Governor Scott; but the campaign, with Moses on one side and the "machine" on the other, is going to be a desperate one. One of the threats of which the negro members of Congress from the State—Elliott, Rainey, Ransier, and Cain—are making use is that of an educational qualification for electors, unless these electors will go to the polls at the next election in a spirit of reform.

The Ohio constitution has been defeated by very heavy majorities, its fate being partly explained by the number of propositions separately submitted to the people, and in part by a general aversion to change. As this is the first, or almost the first, of the new constitutions which has been lost, it may be well to point out here that there appear to be two dangers to be guarded against in framing these instruments into which we in these days are peculiarly likely to fall. The first is that of submitting a number of separate propositions, as with regard to the liquor question, minority representation, or woman suffrage, or judicial appointments. These are generally submitted to a separate vote for the sake of saving the general amendments, but if they are all submitted at once the chance is that, through ignorance or inattention, the whole constitution will go by the board. The other is the temptation, which is so alluring to constitution-mongers of a certain sort, of putting everything into the instrument they prepare, so as not only to make it a fundamental law but a civil code and practice act as well. Recent constitutions afford many curious instances of the absurd tendency of these reformers to go into the minutiæ of legislation, to prescribe for evils with which no constitution has anything to do, to introduce cumbrous machinery, and, instead of simplifying the work of government, to make it more difficult and intricate. In the new Illinois constitution, unless we are very much mistaken, will be found an extraordinary provision of this kind as to contracts for the supply of the State House with certain articles, and in one of them the constitution prescribes all the legislative machinery for the reading and passage of bills—both these provisions being inserted on account of suspicions of the honesty of the legislature or executive.

The most important of the State conventions yet held is that of the Republicans in Pennsylvania, which met on Wednesday week. Two things which it did were not expected by persons outside of political circles, one being the emphatic condemnation of the third-term notion, and the other the bringing forward of General Hartranft as a candidate for the succession to General Grant. The significance of the latter move probably may be that during the sessions of the National Convention of 1876 the Pennsylvania delegation will be in a well-defined position for carrying on negotiations of various kinds, such as Pennsylvania politicians are familiar with in National Conventions. As for the third-term notion, it may seem as if formally killing it in solemn convention were a work of supererogation. It was one of the *Herald's* sensations, and had never any vitality; but it was adhered to by its originators because, while they have found by experience that sensations in general "pay," and some for good apprehensible reasons, they appear to have no means of knowing which of a given number of the other ones are worth working up, and which they might as well have saved money and breath upon. The convention found no life in the idea, but nevertheless "thrice they slew the slain"—by adopting Hartranft; by backing Mr. Dickey's statement that to accuse Grant of wanting a re-election was slanderous; and by voting down, "with loud shouts of disapproval, a resolution endorsing General Grant in the event of his candidacy for a third term." The other resolutions are mainly protectionist, denunciatory of the tariff and the proposed Reciprocity Treaty, and laudatory of the scheme of cheap transportation by water for the products of the West

Since 1870, politics in Missouri have not been in what can be called a settled state, and large numbers of the people are now as discontented with the Democratic régime as they were in that year with the Republican. An independent movement has gathered some headway as in one or two other Western States, and on the second of next month a people's convention will be held at Jefferson City. The Republicans have determined to call no State convention. The Independent party need the aid of Democratic votes to ensure their victory, and the Democrats are divided into two distinct classes—those who were Union men during the war and those who were Confederates. The Democrats, however, have been coquetting with the Grangers, and particularly with Mr. Norman J. Colman, an agricultural editor, who desires the governorship and who is said to have a larger acquaintance and to have visited more towns and villages than any living man in Missouri. A strong opposition has been developed, on the strange ground that this gentleman is not fit for the place, and is a double-faced demagogue, who, while he opposes the Missouri Grange having anything to do with politics, is secretly making use of that order to get office. The correspondent of the *Tribune* predicts in consequence of these facts that if a split takes place in the Democratic convention after the nomination of Colman on the first or second ballot, those who wish to know who is going to be next governor of Missouri must look for the name of the nominee of the Independent party. The Germans are said to be for a reform movement to a man, and are going to be well represented in the St. Louis delegation to the convention of September 2—a delegation "admitted by all parties to be composed of the very best men" in St. Louis—"such a body of men as never before represented St. Louis in any political convention."

General Custer's expedition has succeeded in penetrating the hitherto unexplored Black Hills country of Dakota. The mountains surrounding this country have been long deemed impassable, although a tradition is said to have existed of a very fertile valley beyond them. General Custer, however, found no serious difficulty in getting across the mountains, although he had with him a heavily-laden train of over a hundred wagons. He describes the country within them as beautiful in the extreme, the pasturage excellent, the water pure and cool, and rains frequent; of wood, fuel, lumber, and building stone there is enough "for all time to come." He thinks that the days may be found too short and the nights too cool for corn; but believes that other grain could be produced in abundance. "Wheat particularly would yield largely." Iron and plumbago have been found, and beds of gypsum, "of apparently inexhaustible extent," as well as gold in paying quantities. As an evidence of the richness of the pasturage, he mentions the fact that his cattle, after marching upwards of six hundred miles, were in a better condition on leaving the country than when they entered it. On the line of march to the Black Hills, between the forks of the Grand River, a cave was discovered of great archæological interest, the walls and roof being covered with rude carving or drawing, apparently the work of Indians, and filled with what are supposed to be religious offerings. The correspondent of the *World* accompanying the expedition has sent home the most glowing accounts of the country, which seems to be from all the descriptions fit indeed to fill the coolest mind with ardor.

We have pointed out elsewhere the inherent weakness of Moulton's statement on capital points in the history of the great scandal, and the ludicrous figure which he cuts as the volunteer saviour of society. It is but just to him to say that his statement purports to be the one originally prepared by him for presentation to the Committee, but afterwards withheld, and perhaps is therefore not to be judged as a direct answer to Mr. Beecher's. That we are promised soon; and if it is to be as long, as ill-arranged, and as confusing as the first, there is a good chance of the public making up its verdict in favor of the side which has used the fewest words in this tedious controversy. In the interest of candor, it should be remarked that Moulton's statement compares favorably with Beecher's in the prominence given to the part played by Henry C. Bowen in the Tilton-Beecher imbroglio. Mr. Beecher's forbearance towards this inveterate enemy, and the Committee's failure to summon him either to help blacken Tilton's character or to avow openly the charges which it was in evidence before the Committee he had been for years making secretly but freely against Mr. Beecher, have left an unfavorable impression which needs to be removed. Bowen's course during the trial has been eminently characteristic, and his comments in the *Independent* have been masterpieces of malicious non-committal, retracting nothing, suggesting the worst. To some journalists, the latest of these deadly productions has seemed a noteworthy admission that Mr. Beecher had cleared himself. To Mr. Beecher himself, we do not doubt, it was the voice of Joab asking, "Art thou in health, my brother?"

Though a great deal has been said in the newspapers about the indecency of the Beecher-Tilton scandal, no active steps seem to have been taken to mitigate it anywhere but in Boston. The Board of Aldermen of that city have, it seems, a committee on licenses, which is clothed with authority over the stage of the most unlimited kind. Whether this committee are in the habit of visiting the various places of amusement in Boston or not has not come out; but learning that a drama called "Passion's Perils" was to be played last week at a second-rate theatre, they went to see it, and on the next day sent a note to the proprietors, saying that they had witnessed a representation of the play on the previous evening, and, "being satisfied that said representation is not conducive to good morals, and is offensive to the public sentiment of the community," suggested that the play be immediately withdrawn from the stage, and the posters announcing it removed from the public highways. This was done, but one of the proprietors, who evidently regarded the interference of the committee as the result of a confusion in their minds of the spheres of art and morals, went to the City Hall and requested to have a more definite explanation of the cause of the order, when he was told that the order was sent because, in the opinion of the committee, the play was "prejudicial to the case of Henry Ward Beecher." They were then asked whether they considered the play vulgar or obscene, and they replied that they did not, "but the make-up in the cast certainly personifies Mr. Beecher and others connected with the so-called Beecher and Tilton scandal," and "a large number of people in Boston" felt that it was "gotten up solely for the purpose of prejudicing the case of the principal in that unfortunate affair." To this charge Mr. Stetson replied that the play was written long before the Beecher-Tilton scandal was heard of, and that the characters were arranged without any desire to offend the most sensitive advocate of either side. The Boston public naturally do not regard this explanation as a very plausible one. They are to be congratulated on having got rid of a nuisance which in this city and in Baltimore takes the shape of a pointed dramatization of 'Griffith Gaunt.'

The New York *Freeman's Journal*, a newspaper of ultramontane and Carlist proclivities, has within the past week published a story of a sensational kind to show that Germany was intriguing to get possession of Porto Rico. In April of this year, it stated, Admiral Polo received instructions from Madrid to ascertain what position the Government of the United States would take in the cession of Porto Rico, a note being sent at the same time to the Admiral explaining that the German Government was to raise money for a Spanish loan offered in London, and would establish a fleet of cruisers on the Spanish coast to suppress contraband importations, and would recognize the Serrano Government. To this the Admiral replied that Spain had been humiliated enough in the *Virginius* affair; that the honor and glory of the country were too dear to him to permit him to take part in the proposed disgraceful cession of territory; and in consequence of this he was recalled. This singular story has excited a good deal of discussion in some of the newspapers; it being maintained, on the one hand, that the story is eminently

ridiculous; that Germany and the United States are on excellent terms; and that the last thing the former power would be likely to do would be to insult this country with a proposal to violate the sanctity of the Monroe Doctrine. Mr. Fish at once denied the story; and, as no one seems to have believed it at all, we are led to infer that the voluminous discussion which has taken place has sprung from other causes than credulity—one of these being a deep-seated determination on the part of the average journalist to let the governments of Europe know that, however little the people of the United States care about the intestine broils of the European continent, the contingent remainder which the United States owns in the West Indies must be considered inviolate. With regard to this particular story, however, there seems to be a general agreement of opinion that the only thing necessary to be done is to take the unassailable ground of not believing it.

The Cable despatch which announced the other day that Dr. Kenealy had been punished for his behavior on and after the Tichborne trial is corroborated by the report of the proceedings. The Benchers of Gray's Inn, it seems, notified Dr. Kenealy that they would limit their enquiry to the fact of his being engaged in journalism as the editor of the *Englishman*, and his conduct in that capacity. They next notified the printer of the *Englishman* that they would like him to make his appearance before them. This the printer however regretted his inability to do, on account of the "unbusinesslike" nature of such a proceeding on the part of a printer, while Mrs. Kenealy wrote a polite note to the Benchers, saying that her husband had intended to appear, but "violent pains in the head" rendered it impossible for him to do so, and as he was unwilling to ask for any more time, he would leave the Masters of the Bench to act "as their own sense of honor, right, and justice might dictate." The Benchers thereupon proceeded to consider the case, and found, 1st, that Dr. Kenealy was the editor of the *Englishman;* 2d, that the *Englishman* was "replete with libels of the grossest character"; 3d, that Dr. Kenealy, as such editor, was unfit to be a Master of the Bench; and they thereupon "vacated" Dr. Kenealy's call to the Bench, and resolved that he be prohibited from dining in the hall of the Society. Whether he will be proceeded against further by the judges remains to be seen.

The sudden termination of the farm-laborers' lock-out in England has brought to light some of the accounts of the Union, which show the enormous amounts of money that have been spent in the resistance of the men. $100,000 is the sum raised altogether, and it has almost all been spent—half of this, or $50,000, having gone to the actual support of the men. The laborer, by paying 2½d. fortnightly (the regular rate), got as a locked-out man nine shillings a week, which of course in some cases led to a great deal of imposition. As an illustration of the state of mind produced in some of the men by the continual relief afforded, we may mention the case of one who, as the facts are reported, suddenly goes to his employer and says that he wants to join the Union. The employer says that he is sorry to hear it, for if the man does join the Union he must lose his place. This the man says he knows, but explains that he only wants to "join for a fortnight," and that at the end of that time, if his employer don't mind taking him back, he will surrender his "ticket," and let it be burnt. This proposal still not being explicit enough, the man hints further that what he really wishes is to go to London to see his sister for a couple of weeks; that during this time he would not expect the farmer to pay him, but he could get nine shillings a week by joining the Union, paying a few pennies, and appearing in the character of a locked-out man. Of course such cases are exceptional, but they indicate one of the dangers of the unions—the temptations which they afford to the lazy and dishonest.

The latest news from the East confirms the previous reports of the tendency of China and Japan to go to war over the Island of Formosa. Since May the Japanese have been carrying on military operations against the Malayan savages of the east coast, whose principal tribe is called Boutans; and, having easily succeeded in driving them into their mountain fastnesses, they have manifested their intention to hold the country as a part of the territory of Japan from this time forth. The ostensible object of the expedition was to avenge the slaughter of Japanese crews wrecked in former years on these inhospitable shores. The pretext for invading an island under the dominion of China was the virtual or even explicit refusal of this empire to be responsible for the misconduct of the Formosan aborigines; and it is pretended by the Japanese that Soyeshima, on visiting the Emperor last year, obtained his free consent to discipline the savages with a strong hand. It is also asserted that China never considered the eastern half of the island hers or subject to her authority, and is only now putting forth claims to it when it is seen to be coveted as a joint possession by her rival of the archipelago. On the other hand, there appears to be justification for the opinion that the Formosa expedition grew out of the Saga insurrection, and was designed as a safety-valve for the military restlessness and political discontent which the insurrection revealed. In this aspect of the case, the Japanese people and Government seem fairly entitled to the designation which has sometimes been applied to them of "the French of Asia." The weight of evidence thus far would give the Chinese the advantage of the quarrel in international law and in diplomacy.

The military problem raised by the prospective collision is not so easy of solution. The Japanese force, under their general, Saigo, consists of only two thousand men, but it is fully a match for an equal number of Chinese, and as against superior re-enforcements it has the powerful defence of a couple of iron-clads, in which China is wholly lacking. Not only does this circumstance render Formosa much more remote from the continent than it is from Japan, but the Mikado is in easy telegraphic communication with his expedition, while the Emperor's news must travel slowly and be exposed to interruption by a hostile navy. His commissioner for the settlement of the Formosan difficulty is already said to have petitioned for a cable to be laid between Amoy and the island, and we hear of the Peking Government telegraphing orders to Europe for the building of iron-clads. We doubt if any more favorable opportunity for the sale of the Stevens battery will ever be offered the State of New Jersey. While a naval conflict at present could have apparently but one termination, a land battle with the weapons of civilization in the hands of both combatants would be a curious spectacle, of which the issue, as we have said, would probably turn upon the numbers engaged. The prize is worth a struggle. China is interested, indeed, in keeping at a distance a powerful and menacing neighbor, more alive to improvement and more versed in the arts of Europe; but she will also not willingly give up an island which is the chief source of the camphor product of the world, and which from the rich returns of its rice-crop has been called the granary of Southern China. Formosa produces, too, a fine quality of tea, sulphur is manufactured there in increasing quantities, and the supply of rattan and of valuable forest timber is almost inexhaustible.

The recognition of Spain still hangs fire, Russia being reluctant to act with the other powers, and they apparently not wishing to proceed without her, at least formally. But as far as can be judged from the conflicting reports by Cable, the Republic has virtually been recognized, and at least has gained all the moral advantage that she is likely to gain from recognition. Germany, as was to be expected, declares that further than this she will not interfere in the affairs of Spain. How much her lead in the matter has wounded the sensibilities of Frenchmen is shown in the letter of our correspondent on another page, in which the pressure brought to bear on France to co-operate in recognizing Serrano's Government is characterized as an outrage, like the annexation of Alsace and Lorraine.

THE "WAR OF RACES."

IT is now about the time of year that, from various causes, we hear a great deal about the threatened conflict between the whites and blacks throughout the South. In the first place, as the *Tribune* said the other day, it is in the interest of the Northern Republicans to predict Kuklux outrages, with a view to capital in the autumn elections; in the second place, it is the interest of the Democrats to predict negro atrocities, for objects of a similar kind; in the third place, the South, from the peculiar conditions of public and private life since the war, is a place where lawlessness and violence are more likely to break out at any time than they are in the North. Before the war, the whites generally managed to keep the fighting to themselves; but, since the war, the negroes, being free, have naturally taken part in it also. From these unquestionable facts, however, to jump to the conclusion that we are going to see a "war of races" is quite another thing. If we look into any of the detailed accounts of the recent faction-fights which have been going on in the South, we shall find little evidence in them which will bear out the belief in any settled plans of race-hostility. The affair at Austin and that in which the celebrated "Dick" Busteed has lately been engaged, are both involved in a good deal of mystery, but no intelligent man can read the accounts of both sides without seeing that there was but little disposition either among the whites or blacks to indulge in anything more than a hot-headed quarrel for the moment. The recent riot in Georgetown, South Carolina, was confined entirely to negroes, and originated in a difficulty between two rascally black politicians engaged in a struggle for office, and died out almost as quickly as it began. Even in Arkansas, where a few months ago the line was said to be drawn between whites under Baxter and blacks under Brooks, the mere recognition of the Baxter Government at Washington brought the "war of races" to an end. We may expect to see these *émeutes* and disturbances repeated from time to time in the South; but before we see a general inter-race warfare, some violent change or social cataclysm will probably have to take place.

The fact is that people go on talking and writing about the South as if it were in exactly the same state as it was left at the end of the Rebellion, or rather as it was under Johnson—the blacks in danger of re-enslavement or extermination, the whites looking anxiously about for some shrewd device by which they may under the form of law re-establish the old ante-bellum institutions. But the condition of the South is radically different. Ever since the termination of the struggle between Johnson and Congress, which left the reconstructed States in the hands of the negroes and the carpet-baggers, a slow change has been taking place in the Southern States, by which Southern society has been adapting itself to the new order, and the new order has been adapting itself also to the fundamental peculiarities of Southern society. First, there was established in almost every Southern State a corrupt carpet-bag goverment, which was tolerated at first, but was soon discovered to be ruining the State. Then the property-holders, who in most if not all cases were guided and controlled by the whites, drove out the carpet-bag governments, and established conservative governments in their stead. In one or two States, it is true, as in South Carolina, the driving out of the carpet-baggers did not lead to the creation of a conservative, but of a black government. Speaking of the South generally, however, we may say that the result of the struggles which have been going on there since the reconstruction period has been to sweep away the carpet-bag governments, and bring every year more and more States under the control of a party, led of course by whites, but having also a negro following (as the returns of such an election as that recently held in Vicksburg show), the leaders of which are in the main merely desirous of a cessation of plunder and the restoration of peace and prosperity to the distracted country in which they live. In the State in which the Conservatives have held sway the longest (Georgia), there is least heard of rioting, fighting, or plundering, while in the State in which the Conservative party have totally failed to gain any foothold, society is, to say the least, in as bad condition, plunder as open, and life and property as insecure, as at any time since the end of the war.

This condition of things is what might have been expected to result from the struggle for existence in the South. That the Southern negroes would ever, except in isolated spots where enormous superiority of numbers favored them, take any very lasting or important share in the actual government of the South—framing its laws, directing its investments of capital, and, in short, organizing society—was not to be expected. It was to the race which hitherto has been dominant on this continent that we looked to govern the South again, but under changed conditions, with just laws and with equal protection of the law to white and black. The number of States which have now emancipated themselves from the rule established at the close of the war points to a solution of the Southern question by the operation of natural laws which govern the movements of society; and on the whole, taking everything into account—the exasperation of the native Southern white at the enormities of the carpet-bag governments, the disappointment of the negro in finding that even freedom was not synonymous with cessation from all labor, and the temptation of both races to excess, outrage, and violence of all kinds—it must be admitted that a good deal of praise is due both whites and blacks for their mutual forbearance and consideration during the past six or seven years; and the inference we draw from it is, that in the absence of something very new and unexpected, the "war of races" so much talked about is not a thing of the future but of the past. This war has actually taken place; but instead of being a bloody conflict, such as was at one time expected, it has been mainly a silent struggle on the part of the most powerful and wisest and most trained race in the South to take the lead in public affairs, and this it seems to be gradually doing.

There is one point of view from which the conservative reaction in the South deserves to be looked at with more attention than it receives. Hitherto the Southerners have been too much occupied with the fundamental questions of social existence to take a very active part in the agitation of questions of general political interest. The tariff, the currency, and taxation have been remote and dim objects to men who have been living under Kellogg or Casey or Scott or Bullock. It was easy enough, in the campaign of 1872, to see that the Southerner who supported Greeley did so without any intelligent comprehension of the causes of Northern discontent with the Administration. Moreover, it was noticed during the last Congress that the Southern members, in voting on schemes of internal improvement, inflation, or the like, voted without any head or lead, evidently having no defined policy on these or kindred subjects. It is natural enough that they should not. But it is deplorable to think of the utter extinction of political habit which this implies. The Northern and Eastern and Western representatives made at least a pretence of understanding the will of the people on these and similar subjects, but in the South the people evidently have not been thinking about them for a long time. For nearly fifteen years now they have been in the hands of successive despotisms, until they have almost forgotten that in free countries men live for more objects than the single one of keeping robbers' hands off the earnings of the citizen. It is greatly to be hoped that this is not to continue indefinitely. We may say for our part that if we believed the South were about to rise again out of the void, filling the air with wild and incoherent cries on subjects requiring the deepest reflection and study—subjects, too, on which the politics of the country must for the next quarter of a century turn, and the correct settlement of which is of the gravest moment to each of us—we should rather not have her rise at all.

OUR POLITICAL-CONVENTION SYSTEM.

THE gentleman who has just been "chosen" or "selected" or "called upon" or "requested" to succeed Mr. Willard as a Republican candidate for Congress in Vermont was indiscreet enough, though a practical politician, to make a speech on arriving

at his home. In this speech he alluded to a fact so well known there that denying it would have been sheer nonsense, in the following terms: "I am completely exhausted with the fatigues of the day and the canvass, and cannot stand here and tire myself and you by making a long speech." One of the "local organs" confirms this modest statement, and approvingly adds that the new candidate "was then taken to the quiet and peace of his home, which he very much needs after his severe and protracted labor in the canvass." According to the English practice of electing members of Parliament, a man has to announce himself as a candidate. He may indeed be requested "to stand" by some of his admirers; but they speak merely as individuals to him. The act of becoming a candidate rests with the man himself, and he comes before the public, to that extent at least, upon his own merits. If his standing is an absurdity or an outrage, he very soon learns the fact by somebody else standing, and has the ridicule and expenses of the affair to bear by way of penalty. In this country, custom makes it indelicate and almost outrageous for a man to announce himself as a candidate for Congress. Our theory is that "our party" ought to have but one candidate in the field, and that he ought to be "the best man for the place." Our theory also is that certain discreet and disinterested members of our party shall meet together in convention and select "the best man for the place," and that then it will be the duty of "every good Democrat" or of "every good Republican," as the case may be, to forego his own judgment as to who is the best man, and loyally vote for the nominee of the discreet and disinterested men whom we sent to the convention. Under our system, it is apparent that a candidate does not stand before us upon his personal merits so much as upon the merits of the discreet and disinterested men who selected him. We, as voters, are expected to walk largely by faith and very little by sight; and our faith is expected to be not so much in the candidate as in the men who selected him for us. It is also apparent that a candidate comes before us with certain assumed rights, with certain inchoate claims upon the office, by virtue of which the ordinary train of investigation which we would apply to a clerk we think of hiring, or a horse we think of buying, is reversed, so that voters, instead of asking each other whether the candidate is a good man, capable of making our laws, do, in fact, ask each other whether the candidate has ever been proved guilty of any heinous crime which will warrant them in bolting the nomination and throwing him overboard.

When the present Chief-Justice of the United States performed for his country the very meritorious service of running as an independent candidate to defeat the notorious Mr. Ashley, it was an effective protest against the perversion of our convention system by the political professionals who generally control such bodies. It was perfectly understood that the independent candidate could not be elected—that he was running merely to defeat an infamous nomination; and the same result might have been reached if the same men who voted for the third candidate had simply scratched Ashley's name off the ballots. But it is a singular fact that the American voter must have somebody to vote for, and that he is over-apt to vote for a bad candidate rather than rouse himself to the individual responsibility of stamping out so far as he can the vicious, mercenary class of which Ashley was an authenticated specimen. The necessity of an independent nomination was simply to assure conscientious voters that other conscientious voters were co-operating with them to do what every one of them wanted to do and ought to do by himself, irrespective of the action of all other men. A third candidature, unfortunately, is not an ordinary remedy to which men may resort any day to assure each other that they think alike and are thoroughly in earnest. It is certain to be expensive, liable to be ridiculous, likely to be ineffectual. Few men have the means and determination and moral courage to enter into the contest of an election merely to assert so simple a principle as that a nominating convention must be what it pretends to be, and its candidate decently fitted for the position he is nominated to fill. In the occasional cases where a good citizen like Chief-Justice Waite has the requisite amount of hardihood and self-sacrifice to go into such a fight, we should commend his pluck; and when, like the Chief-Justice, he succeeds in extinguishing so offensive a specimen of the politician as Mr. Ashley, we should thank him for the patriotic service and heartily congratulate him on the happy result. In the greater number of cases where there is not sufficient resentment among the intelligent voters to resist in this way a bad nomination, or where there is no prominent person sufficiently aroused and sufficiently able to bear the brunt of this kind of battle, we should endeavor to effect the same result by quietly rejecting an unworthy nominee, and giving an implied though none the less effective vote for integrity, intelligence, and respectability in office.

A system which is prudent and judicious in theory, but which is a sham in practice, is always a dangerous system. It is in practical results much below an inferior system honestly lived up to and thoroughly carried out. In the early days when the best men in the country were to be found in office, and when they led and controlled, if not wholly composing, our State and National legislatures, one may well believe that the convention system was not a sham. The Whig or Democratic convention which met and selected, or honestly tried to select, the best man of the party in the district as a candidate for an important office, was really a deliberative body and entitled to no little respect. But it was also much more than this, for it was really the agency of the Whig or Democratic portion of the people of that district. Its verdict, though an erroneous one, possessed inherent weight, and could not be lightly cast aside. It was the umpire to whom the earnest Whig or Democrat confided his political preferences, and by its decision he felt bound to abide, and against its judgment he could not honorably interpose his own. There was thus in this country a remarkable dual system of filtration: the legal means of selection given by the election; and behind it an informal method for primarily selecting the fittest, which, though purely voluntary on the part of the people, was almost as obligatory as if it had been established by positive law. No one who contemplates such a system in its purity can wonder that it obtained a very powerful and lasting hold upon the public mind; nor that citizens of the highest intelligence felt bound to yield to its decrees; nor that dissenting from its judgments within the party always had attached to it the character of revolt and the suspicion of unworthy motives and broken faith.

Our present degenerated practice in making and accepting political nominations has destroyed for the most part the virtue of the old system, by transmuting the convention from an agency of the public into an agency of the candidate. When a convention loses that former characteristic of acting for the people and becomes a mere instrumentality of office-seekers, it is plain enough that it retains the form but not the substance of its former self, and that its decisions are no more binding than the decision of the English candidate who nominates himself for Parliament. The verdict of a jury is a fine thing for a litigant to have, provided he did not get it by buying up the jury. But what man of ordinary common-sense would go around the country boasting in one breath of his verdict and of the illegal means by which he procured it? Doubtless there are portions of the country, like South Carolina and Louisiana, so demoralized that men can and do make such boasts as this; but when we hear them made there of judicial proceedings, or when we hear them made in Vermont of political proceedings, we may safely conclude that there has been some very sad demoralization at work. For a candidate like our Vermont friend to tell the public that he is exhausted with the labor of getting himself selected as the fittest representative of his party in the district; and for his friendly newspaper pathetically to picture him as worn out with the toil of destroying the deliberative, impartial usefulness of a convention, is for them to admit publicly that the nomination morally binds no one, and that the judgment of the deliberative body is not worth a straw. A pickpocket who steals a card of admission to a ball might as well walk into an assemblage of respectable people, narrate his exploit, and insist that the card entitled him to be considered a

gentleman of irreproachable character. It is not to be denied that there have been and always will be ambitious men of excellent character seeking prominent positions in public life. It is also equally undeniable that such men, like all others intent on their work, succeed, and make the very best of public servants. But seeking an exalted station must be done by demonstrating unusual abilities, by winning public confidence, by laboriously fighting one's way into the knowledge and respect of mankind: not by the paltry work of packing or biasing conventions.

To those persons who perceive the importance of the coming Congressional elections, or who feel some solicitude in regard to the immediate future of our national affairs, we offer these suggestions: 1st, A political convention packed or biased or improperly influenced is not an agency of the people, and its selections are entitled to no confidence whatever, and are to be judged with all the critical examination which the voter is able to bestow upon them; 2d, A candidate who procures a nomination by improperly influencing a convention, is generally a very unfit man for the place he seeks, and one who would never have been selected by an unbiased, impartial agency; 3d, If we would ever bring back conventions to their original usefulness, it must be through the independence of the intelligent and conscientious few, who will sturdily though unostentatiously resent such nominations as an offence against society and an insult to their own common sense.

MOULTON'S STORY.

WHEN the article discussing the Brooklyn scandal last week was written we were under the impression that Mr. Moulton had finally determined not to appear and testify, and that therefore the case might for all practical purposes be considered closed. Since then Moulton has made his "statement," and we are compelled to discuss it in view of what we have already said upon his share in the affair, deeply as we regret troubling our readers with any more comment on a matter that grows more repulsive the more it is handled.

We have read the Moulton "statement" carefully, and we do not find that it adds anything to the testimony against Beecher already produced, or anything which Beecher's story does not seem sufficient to explain, except Moulton's assertion that both Mrs. Tilton and Beecher repeatedly confessed to him that they had been guilty of adultery. We will now give some reasons for believing Moulton to be a generally untrustworthy person, and, having given them, hope to be discharged from all further attention to the subject. He excites suspicion at once by the manner in which he performed the duty of "arbitrator" and "mediator," inasmuch as it is one to which nobody but a natural-born tattler and scandal-monger would stoop. He appears to have carried a drag-net during the four years, into which he gathered every scrap of writing alluding in the remotest degree to the controversy, including even poor Mr. John Hooker's letter to his wife and Mr. T. K. Beecher's to his sister, though these could have no bearing whatever on the question of Beecher's guilt or innocence, or on Tilton's domestic troubles; and in order to make the collection more complete and to ensure his control of the case, he compelled his "clients" to promise to send him all letters they received from each other, and forbade them to write to each other without his permission. Having thus made sure of his jurisdiction, he devoted himself with wonderful assiduity to "tracing to its source" any filthy rumor which his own or Tilton's prattle set afloat—an occupation which he seems to have found very congenial, but in which few respectable men, let us hope, would engage. The archives which he thus brought together, he arranged and endorsed with scrupulous care. His protégés all seem to have obeyed his injunctions with regard to placing their letters in his hands or informing him of the contents. What followed is now worthy of attention. On the 30th of December, 1870, according to Moulton's statement, Tilton showed him his wife's written confession of criminal intimacy with her pastor. On the same night she wrote and delivered to Mr. Beecher a retraction of that confession, which has been published, in which she declared that the confession had been obtained from her "when wearied by importunity and weakened by sickness," and added, in a postscript, an explicit denial of the accusation contained in the confession, declaring not that she and Mr. Beecher had never been guilty of criminal intercourse, but that he "had never offered her improper solicitations," and "had always treated her as a Christian and a gentleman." This is a pretty clear indication that she did not at that time believe that the confession contained a graver charge, as Moulton and Tilton said it did. On that very night, however, at midnight, this remarkable woman wrote another paper, addressed t her husband, in which she retracted her retraction, said she only gave the letter to Beecher to be used against other persons than her husband, and on the following morning wrote a letter to Moulton asking that both documents—*i.e.*, her confession and retraction—might be destroyed. It would seem as if this was enough to destroy her reputation utterly in even Moulton's eyes, used as he was to the society of queer people. We find, however, that it was not until Mrs. Tilton wrote letters to Beecher in March, April, and May respectively of the following year, asking his forgiveness for the suffering she had caused him, and begging that "the papers" in Moulton's possession might be destroyed, that he (Moulton) lost "whatever remained of faith in Mrs. Tilton's character for truth or propriety of conduct." It will be observed that these letters, now for the first time produced, confirm or at all events tally with Beecher's version. In another letter to Moulton, in February of the same year, she deplores her conduct during the previous year, as having caused "the utter misery of those she loved best—her mother, husband, Mr. B., and my dear children." But even this did not disgust outright the man to whom she had confessed adultery with "Mr. B."

In June, 1873, Moulton admits that he, at Beecher's request, carried to the Brooklyn *Eagle*, altered, amended, and caused to be inserted, a card, signed by Beecher, "declaring that the stories and rumors which had been for some time past in circulation about him [Beecher] were untrue, and that he stamped them in general and particular as utterly untrue." In other words, Moulton, according to his own story, helped to prepare and published a lying card, of the falsehood of which he was thoroughly convinced..

On the 31st of December, 1870, Mrs. Tilton wrote to her "dear friend Frank," asking that her confession and recantation which were in his possession might be destroyed. Upon this Moulton remarks, "I could not, of course, accede to this request of Mrs. Tilton, because *I had pledged myself to Beecher* that her retraction on the one side, and her confession to Tilton on the other, which are the papers she refers to, should not be given up, but *should be held for the protection of either* as against the other." In April, 1872, however, *Tilton* asked him for his wife's confession, to be returned to her, in order to relieve her anxiety. And on this Moulton says: "As *I held it solely for her protection and under pledge to him*, I gave it to him, and he told me afterwards that he gave it into her hands and she destroyed it." Elsewhere he recites the pledge he made to Beecher on this very subject when he extorted the recantation from him. Here are two different versions of the same transaction.

In November of the same year, finding himself bothered by people's enquiries about the affair, and wishing to put himself in a position to meet the stories about Beecher without open lying, he told Tilton that "he wished to be authorized by his wife to deny them," and Tilton obtained from the wretched woman, who seems to have been as wax in their hands, a letter addressed to Moulton containing this passage:

"*Mr. Moulton:*

"My Dear Friend: For my husband's sake and my children's, I hereby testify, with all my woman's soul, that I am innocent of the crime of impure conduct alleged against me. I have been to my husband a true wife; in his love I wish to live and die. My early affection for him still burns with its maiden flame; *all the more* for what he has borne for my sake, both private and public wrongs. His plan to keep back scandals long ago threatened against me I never approved, and the result shows it unavailing; but few would have risked so much as he has sacrificed for others ever since the conspiracy began against him, two years ago."

What are we to think of the man who could under such circumstances ask for such a letter, carry it about with him, and make assertions on the strength of it? He also received a letter from Beecher dated February 5, 1872, in which he says "he committed all to God—whatever it may be here, it will be well there"; and another dated June 1, 1873, in which he says "his mind is clear, and he is not in haste, and that he shall write for the public a statement that will bear the light of the judgment-day," and "that God will take care of him and his"; and this stuff, coming from a minister whom he believed on his own confession to be an adulterer, did not, it appears, disgust him, lessen his friendship, or cool his zeal as a peace-maker. Moreover, he wrote to Beecher on the same 1st of June, "You can stand if the whole case were published to-morrow." As regards the blackmail, he denies that Tilton sought or suggested anything of the kind. Beecher says that Moulton hinted broadly that it would be a good thing for him to give money to Tilton, and that he gave it. Moulton says that Beecher gave the money of his own motion, and that he disbursed it for Tilton's benefit, without Tilton's knowing whence it came. By way of showing Tilton's high-mindedness about money, he alleges that in May, 1873, he offered Tilton $1,000 as a loan on his note; but Tilton sent it back, saying "he could not borrow money, for he saw no way of returning it." Nevertheless, Moulton again offered him the money, and he took it, "not as

a money transaction," says Moulton, "but as a matter between ourselves." What the difference is between "a money transaction" and a "matter between ourselves" it would be hard to say, but during the following ten months Tilton got $4,550 of Beecher's money in instalments, through Moulton, as "a matter between ourselves." For Tilton's ignorance of its source we have Moulton's word. The balance of the $5,000 paid by Beecher seems to have gone to pay for the schooling of a girl whom Beecher says had to be removed from Tilton's house because he tried to seduce her, but Moulton says because she tattled about Mrs. Tilton's bad conduct. We shall not attempt to hold the balance on these weighty matters. We must leave the public to choose between the witnesses. The lying in every direction seems to be tremendous and unblushing. We shall now take leave of the affair with this remark, that the case has evidently reached a stage at which the further discussion of it will do no good, and serve no purpose but to gratify the cravings of the actors in it for notoriety. It has come to be a "conflict of veracity" between people whose moral standard is evidently not that of respectable men, and the best thing the public can do is to let it drop.

FRANCE AND ITALY.

BELLAGIO, August 9, 1874.

LEAVING Paris and Versailles and the Assembly behind me, I have been wandering in the high Alps for a short time, and staying at the most romantic village of Macugnaga, at the foot of Monte Rosa. I have paid my court to this giant of mountains, which only deserves its name on the Italian side, as the sun covers it every morning on that side with a pink hue of indescribable beauty. I will not, however, attempt to compete with Murray or Baedeker, and I would not have mentioned this visit to the Italian side of the Alps if I had not spent some time in the little inn of Macugnaga with one of the foremost Italian statesmen, whom I have long known, and who was one of Cavour's fellow-laborers in the field of Italian unity. Our meeting was almost painful at first. Everything seems to smile on Italy. Rome has become her capital, the work of unity is accomplished; Milan, Florence, Rome, Naples are adding new marvels to the old; no enemy threatens the *re galantuomo* and his people; the divisions of parties are as slight as those observable in England between the Tories and the Whigs. And where is the glory of France, despoiled of provinces, torn from two millions of her most patriotic sons, deprived of her strongest fortresses, humbled in her military pride, rent by factions? The contrast is one which must suggest itself at once to the mind. The Italians are gentle, and my friend tried to persuade me that France was still "la belle France," and that Italy had her troubles also. "See how rich you are," said he; "you have paid your ransom with an ease which has astonished the world; your funds are reaching par, your bank-notes are as good as gold, and as soon as you crossed the Alps you found our dirty paper-money, and have received for every napoleon in gold twenty-two *lire*. The financial situation of Italy is a serious source of anxiety to all Italian patriots; we have tried every tax and every possible economy, and we cannot make both ends meet. We have sold as much as we could of the property of convents, but this exceptional resource will not be eternal. On the other hand, we are pensioning all those who lived on this property, though to be sure this debt will be extinguished in course of time."

This brought us to the Church question; my friend was very indignant at the attacks made on the Italian Government by a certain Archbishop on his return from Italy. The Archbishop described the Catholic Church as persecuted and deprived of all its liberties. The accusation is not well founded; the law passed two years ago on the relations of church and state is in reality very liberal; it was the translation of Cavour's famous motto: "A free church in a free state." The policy of the Church is, of course, to play the part of martyr; but there is no interference anywhere in Italy with the discipline, the teaching, the preaching of the Catholic clergy. I could not help being struck by the nervousness of my friend on the subject of the Pope. It has always been clear to me that the Italians are very desirous of a reconciliation of the King of Italy and of the Pope. They don't intend, if they can, to lose the prestige of the Papacy. They know that an immense power is still concealed in its very name; they are not fanatics in religion or irreligion; they would not dispense with the presence of the spiritual chief of the oldest Christian church. They are politically allied to Germany for the present, but they look with some contempt and disgust on the brutal persecution of the Catholic bishops of Germany, the sale of their furniture at auction, and all such acts, which are not in accordance with the spirit of our age. The Italians, it must be well understood, are a very refined and a very old race; they detest useless brutality, useless exhibition of force. The Pope knows well that he offends them in the most tender parts by never crossing the door of the Vatican and so playing the martyr and the prisoner. The streets of Italy are full of photographs which represent Pio Nono, in his white gown, arm-in-arm with Victor Emanuel, his hand on his sword. This photograph represents the real Italian feeling, the long-expected alliance of the national King and a national Pope. Victor Emanuel dislikes Rome, and would much prefer to remain in his mountains of Piedmont, camping near some glacier and hunting the chamois. He said to a friend not long ago, pointing to the Vatican: "There is the prisoner free, and here, in the Quirinal, you see the free prisoner." He is the prisoner of Italian unity. Italian statesmen affect to dread the interference of France in favor of the temporal power of the Pope; this affectation may be the excuse of many who were once the strong partisans of the French alliance, and who now are the courtiers of Prince Bismarck. It would not appear well, in the eyes of the world, to turn abruptly from the French Empire to the German Empire; but then they say that they are much afraid that the Emperor Napoleon was their best friend in France, and that having lost him they have lost everything; that the Clerical party in France is constantly preaching a crusade against Italy; that Saint Peter's pence, the pilgrimages, the Catholic revival in France, are parts of a vast system of reaction which threatens the work of Italian unity. I suppose that with some these fears are sincere; with many they cannot be so. There is not a single party in France which thinks of making war on Italy or of re-establishing by force the temporal power of the Pope. The Legitimist and Clerical papers are doing much mischief by constantly insulting and attacking Italy; the Republican press does nearly as much by treating the opposition of the Clericals to Italy as something serious, which it is not. I was horrified on finding in my friend's mouth arguments and considerations which were just the repetition of what I am condemned to read in the papers of M. Thiers or of Gambetta. The fact is that in France nobody thinks of Italy at all. France feels isolated; she is alone, sullen, discontented; she knows that even the Latin races are estranged from her; she has ceased to care for what goes on outside of her frontiers. I could not well persuade my friend of this indifference, for it is not real indifference; it is a strange admixture of resentment, of pride, and of disgust. The French people have a dim and painful feeling that whatever they do they will be ill-judged as long as they are not powerful as they once were. You will probably read in many papers that France is helping the Carlists in Spain; France does not know the Carlists, nor cares whether one general or another is in power in Spain. Of course, on the long mountainous frontier of the Pyrenees the smugglers, familiar with all the passes, carry on a brisk trade in contraband of war; but if France, as a nation, is made responsible for the cruelties of the Carlists, it will only be a new example of the truth that justice is not to be found in politics. The law of nations has not been deliberately violated in any instance by our Government in favor of the Carlists; the Government which is at war with them is not a recognized Government; and it hardly befits those to give us lessons in this case who once helped the Southern States with all their might when they had ambassadors in Washington.

It was probably not without good reason that Mr. Disraeli twice pointed out recently some hidden dangers which threaten the actual peace of Europe. It seems at times as if mysterious forces were congregating all round France; in Spain, she is represented as the chief supporter of a cruel civil war, and of a party detested by the majority of the population; in Italy, as the champion of the temporal power, the enemy of Italian unity; even in little Geneva, she is cursed by the so-called Liberal Catholics, and Father Hyacinthe has at last been obliged to resign, as he has found too late that the Liberal Catholics of Geneva were no more liberal than Catholics, and that he had allowed himself to become a mere tool in the hands of the enemies of his country. The religious struggle which is going on all over Europe may after all end in a great struggle against France. There are hidden or open affinities between the new reformers and Germany, and it is for this reason that France instinctively draws back from her own Republican and Communistic reformers. Great as her misfortunes have been, she feels that greater misfortunes are perhaps preparing for her; she sees an enemy everywhere, she distrusts all parties; she rests a moment under the strong hand of an honest soldier, who will give her breathing time and a short period of security. When the first Italian regiments entered Rome, a struggle began of which this century may not see the end. Now, as in the sixteenth century, the religious passions will become the mantle of political ambitions. It is distinctly the object of Prince Bismarck to effect a permanent division of the Latin races in Europe, to turn Spain and Italy against France; and he thinks that this design cannot be better accomplished than by promoting in Italy the cause of a dynasty which is at war with the Pope, in Spain of a Republic which has exiled the Bourbons. Let France only be patient, and wait, and be silent — the time will come when Italy and the Papacy can become reconciled; when Cavour's motto will be a reality at Rome itself; when Spain, disgusted

with revolutions, will find some national ruler not ready to bargain with her honor and her interests; and when France will be able to draw more distinctly the line of her responsibilities. Now she must submit to every outrage; her only way to show her old spirit is not to fall into the snares of those false friends who would engage her in the most dangerous experiments. France long ago accomplished her civil and religious revolution; she need not be drawn into a new hundred years' war and make new crusades; she must remember now the famous despatch written by Prince Gortchakoff, after the Crimean war: "Russia collects herself" (La Russie se recueille). Not many years afterwards, Prince Gortchakoff was able to obtain by a peaceful negotiation the revision of the Treaty of Paris. Neither men nor treaties are immortal; France has nothing to expect except from time and from the consequences of her own abdication in Europe. She must, so to speak, make a vacuum, and it will be soon felt that the nation which can fight for an idea cannot be so well dispensed with. For the present, let the Italian Government ask for the withdrawal of the *Orénoque*, and let the *Orénoque* be withdrawn from Civita Vecchia. Let Germany ask for the recognition of the Serrano Government, and let Serrano's Government be officially recognized. It will not add much to the vitality of the Government of Spain, and hardly anything can be added to the humiliation we have already borne. When a man has lost his wife, he does not mourn over his dog.

IN HOLLAND.

THE HAGUE, August 8, 1874.

IT would amount to positive impudence, I suppose, to introduce these few impressions of Dutch scenery by an overt allusion to the beauties of the Rhine. And yet it was by the Rhine, a few days since, that I entered Holland, and it was along an arm of the Rhine, subdued to the likeness of a homely Dutch canal, that I wandered this afternoon in drowsy Leyden. As many as thirty years ago, I believe, it was good taste to make an apology for a serious mention, of the descriptive sort, of the vineyards of Bingen or the cloister of Nonnenwerth, and if the theme had been rubbed threadbare then, it can hardly be considered presentable now. But thus much I may boldly affirm, that if my corrupt modern consciousness had not assured me that these were terribly faded charms, I should not have guessed it from the testimony of my eyes. After platitudes, as well as after battles, Nature has a way—all her own—of renewing herself; and in a decent attitude, at the bow of the boat, with my face to Nature and my back to man, I ventured to salute the castled crags as frankly as if I were making a voyage of discovery. The time seems to me to have come round again when one ought really to say a good word for them. I insist upon the merits of no particular member of the crumbling fraternity; there are many worthy men whose pockets it might be awkward to examine; and the Rhenish dungeons, from a more familiar standpoint than the deck of the steamer, may prove to be half-buried in beer-bottles and lemon-peel. But they still pass their romantic watchword from echo to echo all along the line, and they "compose" as bravely between the river and the sky as if fifty years of sketching and sonneteering had done nothing to tame them. The fine thing about the Rhine is that it has that which, when applied to architecture and painting, is called style. It is in the grand manner—on the liberal scale; that is, it is on the liberal scale while it lasts. There is less of it, in time, than I had been remembering these fifteen years. The classic sites come and go within an easy four hours; and if you embark at Mayence you leave the last and most perfect of the castled crags—the Drachenfels—behind you just as your organism, physical and mental, is being thoroughly attuned to the supreme felicity of river navigation. It was a grayish day as I passed, and the Drachenfels looked as if it had been stolen from a background of Claude to do service in the Rhenish foreground. It has the ideal, romantic contour.

It stands there, however, like some last ringing word in an interrupted phrase. The vast white river sweeps along into Holland on a level with its banks, finally to die in a slush of marshes and a mesh of canals, within sound of the surge of the North Sea. I left it to its destiny, and gathered my first impressions of Holland from the window of the train. The most pertinent thing one may say of these first impressions is that they are exactly, to the letter, what one expects them to be. If you come this way, as I had, chiefly with an eye to Dutch pictures, your first acquisition is a sense, no longer an amiable inference but a direct perception, of the undiluted accuracy of Dutch painters. You have seen it all before; it is vexatiously familiar; it was hardly worth while to have come. At Amsterdam, at Leyden, at The Hague, and in the country between them, this is half your state of mind; when you are looking at the originals, you seem to be looking at the copies; and when you are looking at the copies, you seem to be looking at the originals. Is it a canal-side in Haarlem or is it a Van der Heyden? Is it a priceless Hobbema, or is it a meagre pastoral vista, stretching away from the railway track? The maid-servants in the streets seem to have stepped out of the frame of a Gerard Dow, and appear equally adapted for stepping back again. You have to rub your eyes to ascertain their normal situation. And so you wander about, with art and nature playing so assiduously into each other's hands that your experience of Holland becomes something singularly compact and complete in itself—striking no chords that lead elsewhere, and asking no outside help to unfold itself. This is what we mean when we say, as we do at every turn, that Holland is so *curious*. Italy is not curious, as a general thing, nor is England, in its leading features. They are simply both eminent specimens of a sort of beauty which pervades in a greater or less degree all our conceptions of the beautiful. We admire them because they stand, as it were, in the high-road of admiration, and whether we pass them at a run or at a walk our pace is part of the regular æsthetic business of life. But to enjoy the Low Countries, we have to put on a very particular pair of spectacles and bend our nose well over our task, and, beyond our consciousness that our gains are real gains, remain decidedly at loss how to classify them. This is the charming thing in Holland—the way one feels one's observation lowered to a relish of the harmonies of the minor key; persuaded to respect small things and take note of small differences; so that really a week's sojourn here, if properly used, ought to make one at the worst a more reasonable, and at the best a more kindly, person. The beauty which is no beauty; the ugliness which is not ugliness; the poetry which is prose, and the prose which is poetry; the landscape which seems to be all sky until you have taken particular pains to discover it, and turns out to be half water when you *have* discovered it; the virtues, when they are graceful (like cleanliness), exaggerated to a vice, and when they are sordid (like the getting and keeping of money), refined to a dignity; the mild gray light which produced in Rembrandt the very genius of chiaroscuro; the stretch of whole provinces on the principle of a billiard table, which produced a school of consummate landscapists; the extraordinary reversal of custom, in which man seems, with a few windmills and ditches, to do what he will, and Providence, holding the North Sea in the hollow of his hand, what he can—all these elements of the general spectacle in this entertaining country at least give one's regular habits of thought the stimulus of a little confusion, and make us feel that one is dealing with an original genius.

The curious fortunately excludes neither the impressive nor the agreeable, and Amsterdam, where I took my first Dutch walk, is a stately city, even though its street-vistas do look as if they were pictured on a tea-caddy or a hand-screen. They have for the most part a broad, sluggish canal in the middle, on either side of which a row of perfectly salubrious, but extremely attenuated trees grow out of a highly cultivated soil of compact yellow bricks. Cultivated I call it by a proper license, for it is periodically raked by the broom and the scrubbing-brush, and religiously manured with soapsuds. You lose no time, of course, in drawing the inevitable parallel between Amsterdam and Venice, and it is well worth drawing, as an illustration of the uses to which the same materials may be put by different minds. Sky and sea in both cases, with architecture between; winding sea-channels washing the feet of goodly houses erected with the profits of trade. And yet the Dutch city is a complete reversal of the Italian, and its founders might have carefully studied Venetian effects with the set purpose of producing exactly the opposite ones. It produces them in the moral line even more vividly than in the material. It is not that one place is all warm color and the other all cold; one all shimmer and softness and mellow interfusion of every possible phase of ruin, and the other rigidity, angularity, opacity, prosperity in their very essence; it is more than anything that they tell of such different lives and of such a different view of life. The outward expression on one side is perfect poetry, and on the other is perfect prose; and the marvel is the way in which thrifty Amsterdam imparts the prosaic turn to things which in Venice seem the perfect essence of poetry. Take, for instance, the silence and quiet of the canals; it has in the two places a difference of quality which it is almost impossible to express. In the one it is the stillness of order, and in the other of vacancy—the sleep of idleness and the sleep of rest; the quiet that comes of letting everything go by the board, and the quiet that comes of doing things betimes and being able to sit with folded hands and say they are well done. In one of George Eliot's novels there is a portrait of a thrifty farmer's wife who rose so early in the morning to do her work that by ten o'clock it was all over, and she was at her wit's end to know what to do with her day. This good woman seems to me an excellent image of the genius of Amsterdam as it is reflected in the house-fronts—I penetrated no deeper. It is impossible to imagine anything more expressive of the numerous ideas represented by the French epithet *bourgeois* than these straight façades of clean black brick capped with a rococo gable of stone painted white, and armed like the forehead of the unicorn with a little horizontal horn—a bracket and pulley for hauling store

able goods into the attic. The famous Dutch cleanliness seems to me quite on a level with its reputation, and asserts itself in the most ingenious and ludicrous ways. A rosy serving-maid, redolent of soapsuds from her white cap to her white sabots, stands squirting water from a queer little engine of polished copper over the majestic front of a genteel mansion whose complexion is not a visible shade less immaculate than her own. The performance suggests a dozen questions, and you can only answer them all with a laugh. What is she doing, and why is she doing it? Does she imagine the house has a speck or two which it is of consequence to remove, or is the squirt applied merely for purposes of light refreshment—of endearment, as it were? Where could the speck or two possibly have come from, unless produced by spontaneous generation? There are no specks in the road, which is a neat *parquet* of scoured and polished brick; nor on the trees, whose trunks are to all appearance carefully sponged every morning. The speck exists evidently only as a sort of mathematical point, capable of extension, in the good woman's Batavian brain, and the operation with her copper kettle is, as the metaphysicians would say, purely subjective. It is a necessity, not as regards the house but as regards her own temperament. Of a dozen harmlessly factitious necessities of the same sort, the canal-sides at Amsterdam offer lively evidence. Nothing could be more thoroughly in keeping with the *bourgeois* spirit than the way in which you everywhere find this brilliant cleanliness and ceremonious thrift playing the part not of a convenience but of a restriction—not of a means but of an end. The windows are of those huge plates of glass which offer a delectably uninterrupted field for friction; but they are masked internally by thick white blinds, invariably drawn, and the only use of their transparency to any mortal is to enable the passer-by to examine the texture of the stuff. The front doors are hedged in with little square padlocked barriers, to guard the doorsteps from the pollution of foot-prints, and the visitor must pocket his pride and apply at an humbler portal, with the baker and the milkman. In such houses must dwell people whose nerves are proof against the irritation of minute precautions—people who cover their books with white paper and find occasion for a week's conversation in a mysterious drop of candle-grease on the table-cloth. The traveller with an eye for details will find some eloquence in the fact that, though the canals at Amsterdam and Leyden offer continually this charming pretext of trees by a water-side, there is not in their whole length a single bench for a lounge and a half-hour's æsthetic relish of the situation. The traveller in question though, shrewd fellow, will not be prevented by the absence of benches from getting it, as he looks up and down and sees the wide green barges come floating through the respectable stillness, and the quaint old scroll-work of the gables peep out through the meagre density of the trees.

At The Hague, evidently, people take life in a lighter, more irresponsible fashion. There are two or three benches by the canals and an air of mitigated devotion to compound interest. There are wide, tranquil squares, planted in the middle with shady walks and bordered with fine old abodes of moneyed leisure, where you may boldly ring at the front door. The Hague is in fact a very charming little city, and I should be at a loss to say how much I find it to my taste. It is the model of a minor capital; small enough for convenience and compact sociability, and yet large enough to exhibit certain metropolitan airs and graces. It is one of the cities which please indefinably on a short acquaintance and prompt one's fretful fancy to say that just *this*, at last, is the place where we could come and lead the (from the worldly point of view) ideal life. It hits the happy medium between the bustling and the stagnant; it is Dutch enough for all sorts of comfortable virtues, and, where these intermit, it is English and French, and, in its diplomatic character, cosmopolitan. There must be very pleasant things done here, and I hope, for symmetry's sake, there are pleasant people to do them worthily. I imagine there are. But I do wrong to consume valuable space in these fruitless speculations when I have not yet said a word on the topic on which I had it chiefly at heart to touch. A week in Holland is necessarily a week in the company of Rembrandt and Paul Potter, Ruysdael and Gerard Dow. These admirable artists have had my best attention, but I do not know that they have given me any new impressions, or indeed that, in the literal meaning of the word, they have given me any impressions at all. I looked for a long time, only this morning, at the hand of Madame van Mieris in the little picture in the Museum here, by her husband, representing him and his wife playing with a tiny spaniel. He is pulling the dog's ear and she is pressing it against her bosom with an arm bare to the elbow. It seemed to me that it was worth the journey to Holland simply to see this appreciative husband's version of his wife's hand, and that if I had seen nothing else I should have been repaid; but beyond producing this eminently practical reflection, the picture was not suggestive. I find in my guide-book, on the margin of the page which dilates upon the great Van der Helst at Amsterdam (the Banquet of the Civic Guard), the inscription in pencil—*superb, superb, superb!* But this is simply a term of enjoyment and not of criticism. Let me however have the satisfaction of repeating, in ink for the printer, that the picture *is* superb. To the great treasure (after Rembrandt's Lesson of Anatomy) of the Museum here—Paul Potter's famous Bull—one would willingly pay some more elaborate compliment; not because it is a stronger work (on the contrary), but because it is the work of a lad of twenty-two. The subject is the most prosaic conceivable, and the treatment is perfectly in keeping; but if one considers the magnificent success of the enterprise from the painter's own point of view, there is certainly real poetry in the fact of his youth. It is hardly less true of Rembrandt than of his various smaller comrades (unusual as the judgment may seem), that he is not an intellectually suggestive painter. There are no ideas in Ostade and Terburg, in Metzu and Ruysdael (who, by the way, gives me the largest sum of tranquil pleasure of any painter of the school); but you bear them no grudge, for they give you no reason to expect them. It is one of the regular traditions, however, that Rembrandt does, and I can only say that in this case tradition has distinctly missed her way. It is the more singular that he should not, inasmuch as (I should go so far as to say) he was really not, strictly speaking, a painter. He was perfectly arbitrary, and he kept on terms with observation only so long as it suited him. This may be verified by reference to any of the most delusively picturesque of his works. They are magnificent, but compare them, for simple verity, with the little Adrian van Ostade in the Van der Hoop collection, and compare them, for thought, with any fine Tintoretto.

Notes.

THE twenty-second volume of the 'Proceedings of the American Association for the Advancement of Science' (Portland meeting, 1873) reached us just on the eve of the meeting this year at Hartford, concluded last week. We hope that the Secretary's anticipation that "the volume will naturally increase in size from year to year" will, owing to the new rules concerning publication, not be realized. The class of topics in the present volume ranges from "A Stroke of Lightning, with Hints as to Immunity," to the "Determination of Transatlantic Longitudes."——Prof. Ch. Fred. Hartt's paper on the Geology and Physical Geography of the Lower Amazons, read before the Buffalo Society of Natural Science last year, has been published separately from the Society's Bulletin. It treats of the interesting table-topped hills in the Ereré and Monte Alegre district, and is illustrated with a number of admirable little sketches of the above formation, and one general view of the valley of the Amazons, from the author's own pencil. An accompanying paper on the Devonian brachiopoda of Ereré, by Richard Rathbun, is illustrated by Prof. Hartt with forty-eight photographs of the fossils described.——Hurd & Houghton have issued for the American Social Science Association Number VI. of their Journal. This and the succeeding number will embrace nearly all the papers read at the New York meeting last May. We have already had occasion to notice the mistaken catholicity which admits such a paper as that of Mr. Flagg's on the Farmers' Movement. It is announced that the journal will hereafter be issued at least semi-annually, and quarterly if possible, making a volume of about five hundred pages. Subscriptions will be taken at the rate of one dollar for two hundred pages.——We have received from F. R. Wetmore & Co., stationers, Yokohama, a large map of Tokio, for the topographical exactness of which the publishers do not vouch, but which they say will reasonably answer the needs of tourists and foreign residents. A very full directory of the principal quarters, streets, bridges, public buildings, etc., accompanies the map.——A popular description of Pompeii, by Director Fiorelli, will shortly make its appearance, and as the subject is one which never stales, we may look for translations of the work into every European language.

—The dependence of the South on Northern presses and paper-mills, and the extremity to which the Confederate States were driven on account of the scarcity of paper, created a new field for the collector and bibliographer. Doubtless all our great libraries have as curiosities some specimens of trans-Mississippi journalism printed on wrapping-paper, or even on wall-paper, with perhaps a stray Confederate book or two. A recent catalogue of Robert Clarke & Co., Cincinnati, gives a list of twenty-five books, "dingy and roughly printed" on Confederate paper, which are offered for sale along with a lot of sheet-music of the same manufacture. Nearly half the books are school-books, duty combining with necessity to produce a series uncontaminated with Yankee and Union heresies. Most of these, again, were published at Raleigh, where a Mrs. M. B. Moore was found willing to prepare a Dixie Primer, First Dixie Reader, Dixie Speller, Primary Geography, and Geographical Reader for the Dixie Children. This last, says the catalogue, has very rude and curious maps, in one edition roughly color-

ed by hand; and the abstract and permanent nature of the information imparted may be judged from the following passage, which was probably favorite reading with the Dixie children: "The Southern Confederacy is a great country. The Yankees thought to starve us out when they sent their ships to guard our seaport towns. We were considered an indolent, weak people; but our enemies have found us strong, because we had justice on our side." It was at Raleigh, too, that the Rev. Brantley York kindly revised his English Grammar, and adapted it to Southern schools, as even the Yankee grammar, with its useless distinction between *shall* and *will*, stood in need of overhauling; and that Mr. L. Johnson launched his Elementary Arithmetic, with its choice examples in short division. The rogue composed them as late as 1864, yet with as much confidence as if they were problems in celestial mechanics:

"If 1 Confederate soldier can whip 7 Yankees, how many soldiers can whip 49 Yankees?"

"7 Confederate soldiers captured 21 Yankees and divided them equally between them; how many did each have?"

It must have been a great shock to the "beginners" for whom this arithmetic was designed, to find a year later that, after all their dividing, there was still a considerable "remainder" of Yankees and none of Confederates. A Grammar of the French Language, "first C. S. A. edition," by John Christison, published at Richmond, is the most advanced text-book mentioned in Mr. Clarke's list. Bibliomaniacs ought to secure the New Testament, published at Augusta, Ga., by the Confederate States Bible Society, instituted in the year 1862.

—We have received a copy of General Pope's reports and letters on Indian affairs. His information and suggestions go quite sufficiently into detail, and justify the conclusions on which he bases many of the latter. The history of the reservations north and south of the Ohio and east of the Mississippi has been very different. The Indians on the north of the Ohio were placed in the country occupied or claimed by the Indians, and "the natural result followed." The white settlers crowded in, and narrowed more and more the range of the Indians. The Indians, on the other hand, found the reservations a place of refuge after committing robbery, murder, or arson. A little while only was needed to make it plain that the whites and Indians could not live in such close neighborhood on these terms, particularly as the lands of the reservations, rising in value, began to attract the cupidity of speculators, and it was thereupon determined that they must be removed to still further hunting-grounds. "The result has been," to quote the words of General Pope, "that the various tribes which once inhabited the States of Ohio, Michigan, Indiana, Illinois, Wisconsin, Iowa, and Missouri have been again and again removed from one reservation to another, until at last they are found along the western frontier of Missouri and within the limits of Kansas. The broils and difficulties attending their residence on these various reservations, and the suffering of the Indians from want and from other causes, have so diminished their numbers, that of the various powerful and populous tribes which once inhabited the great region east of the Mississippi, there now remain but a few insignificant and feeble remnants along the extreme Western frontier. What has become of the great tribes famous in our history—the Delawares, the Shawnees, the Miamis, the Sacs and Foxes, the Pottawatomies, the Winnebagoes, the Kickapoos, and many others equally populous and powerful? A few feeble, helpless, worn-out fragments alone remain of all these great Indian nations." In dealing with the Indians of the Southern and Southwestern States, however, the Government modified this policy, sending them all to one Territory, west of Arkansas, without making them pass through the intermediate stages which the northern tribes were forced to endure. The contrast between the two, now brought into immediate contact in the Indian Territory, is very striking—the southern tribes being "numerous and strong, and, as far as Indians can be, prosperous and improving; the other, poor, feeble, helpless, and hopeless."

—The "reservation" system is that which is now in full force. The Indian tribes are stretched in a north and south line on the extreme Western frontier of civilization. The whites are continually pressing upon them, quarrelling with and cheating them, and bringing down upon their heads retaliatory outbreaks. Up to the period of the outbreak the Interior Department has had the matter in charge; but soon as an attack occurs the War Department, utterly ignorant of the whole situation, is called in, and the troops sent in a fruitless pursuit of the Indians. The Indians, who are by this time safe and sound on their reservation, send down word that they would now like to make a "treaty," when the War Department troops retire from the scene, and the tribe, under safe-conduct, have a talk with the representatives of the Interior Department and sign a document promising to keep the peace, receive the whiskey, firearms, and ammunition and blankets they want, and then *da capo*. The remedy proposed by General Pope is to remove the Indian, not temporarily to a reservation which furnishes him a convenient base for warlike operations, but permanently, and to remove him, instead of westward, eastward, toward the sources of cheap food and clothing, in the rear of the advancing emigration, in the vicinity of a society well organized and well administered, where he will be protected not plundered, and if punished, punished legally, not in lawless revenge; and where all thought of return to his own country is hopeless. Whatever may be thought of the feasibility of this plan, there can be no doubt that General Pope is right in his strictures on the bungling of Indian management by the Government; and in his explanation of its causes; and in his belief that the treaty system is a delusion and a snare, based on the absurd legal fiction that the Indians are the owners of the soil, in the same sense that civilized communities are sovereign. "I have not undertaken," Gen. Pope says, "to discuss the question of the right of a few nomadic Indians to claim possession of the vast districts of country which they roam over, to check the advance of civilization, or to retain in wildness and unproductiveness, for the scanty subsistence of a few thousand savages, regions which would support many millions of civilized men. However such questions may be decided by abstract reasoning, all history shows that the result will be in some way the dispossession of the savage and the occupation of his lands by civilized man. The only practical question, therefore, for the Government to consider, is the means by which this result may be attained with the greatest humanity, the least injustice, and the largest benefit to the Indian, morally and physically."

—The *Geographical Magazine* for August (John Wiley & Son) is an exceptionally good number, the first three articles—on the Cameron expedition, the Lufiji River and the coral trade, and the voyage of the *Challenger*—being very interesting reading, and Mr. Godfrey Turner's "Impressions of Jamaica" continuing as entertaining and instructive in the second chapter as in the previous one. Capt. Davis's notes on the progress of the *Challenger*, the third of a series, are enlivened by the romantic story of two Germans, brothers, who were rescued by the vessel from one of the islands of the Tristan da Cunha group. Among the proceedings of geographical societies, which are regularly reported in this magazine, those of Hamburg deserve attention on account of the statistics of Italian emigration and colonization furnished in a paper read by Signor Negri, president of the Italian Geographical Society. Diligent and systematic enquiries through the consulates have enabled him to fix the number of Italians settled abroad at 400,000 to 500,000. The yearly migration, from home and from foreign parts, he estimates at 40,000, the main stream setting powerfully to the Plate River, where they do well as sailors, fishermen, and peasants, and in considerable numbers on the boards of theatres. In Buenos Ayres they form one-third of the entire population (84,000); in Peru, they are reckoned at 14,000. In Japan the number has increased, owing to the important trade in silkworms' eggs, which bring in Italy a profit of from eight to twelve million francs per annum. In the South Pacific, Italians do not as yet abound. Coming to the United States, Signor Negri assigns us about 70,000 of his countrymen, or but few less than the Argentine Republic lays claim to. This is, however, a manifest error, and one which ought to have been avoided when the Ninth Census was at hand to inform him that in 1870 our Italian-born population was just rising 17,000. California, he goes on to say, owns about 10,000; but the Census gives only 4,660, and it is unlikely that these have doubled in the interval. For good wild guessing there is nothing like estimates of population by simple "observers," and we remember to have seen the Italians in California and the adjacent States and Territories set down at from 20,000 to 22,000 "undoubtedly." This was by a correspondent of the *Eco d'Italia*, of this city, in 1872.

—Readers of M. Jules Verne's veracious history of Mr. Phileas Fogg's 'Tour Round the World in Eighty Days' will remember that one of the stirring incidents of that remarkable journey was the rescue of an Indian princess from death by fire at the hands of priests in an Eastern forest. Indeed, this was a very important part of the tour, for by his chivalrous act Phileas was delayed so long that had it not been for the fortunate scientific principle that by going round the world the traveller gains twenty-four hours, he would not have been able at the end to appear calm and imperturbable to claim his stakes on his eightieth day in his club in London. Most readers have probably considered this incident as an exaggeration, there being no custom of burning Indian maidens, such as that described, known to or recorded by the travelling public. M. Verne, however, who is no blind pedant in his love of literalness, probably had in mind the rite of *suttee*, and if we permit the reasonable romantic license of a widow being changed into a maiden, and the burning for similar reasons made involuntary, there is no reason why the fiction should not be considered as nearly founded on fact as many another; for it seems, notwithstanding the vigorous efforts of the English to put an end to suttee for half a century, it is still practised in

remote villages. A late Indian paper gives the following account of the rite in its present decadent and obsolescent condition:

"It seems that cases of suttee still occur in remote villages of Central India and Rajpootana. A few months ago the ancient rite was performed by the family of a money-lender in Bikanir. On that occasion the chief culprit was sentenced by the Rajah to ten years' imprisonment, and a fine of 300 rupees was levied on his village. Similar attempts have been made elsewhere to carry out the same barbarous usage, and the strangest thing is that they are frequently made among the lower classes, who in India as elsewhere are prone to imitate the manners and customs of the higher classes. In India, where the metempsychosis was also a cherished belief, they are also spurred by the hope of rising to a higher state of existence after death. The practice in such cases appears to be that, after the funeral pyre has been more or less burnt down, the widow should slip away from her house, perhaps under the pretence of going for the customary purification by bathing after a death in the family, and seat herself on the smouldering heap. If the fire has burnt too low to consume her, it is enough to ignite her clothes and lead to her death, then or afterwards, from the burns inflicted, unless she is discovered and rescued immediately, as sometimes happens. More often, perhaps, some member of the family, on coming up and finding the widow already scorched, will leave her where she is, adding fuel, if necessary, to the fire, in order to complete an act which he may still regard as a religious duty."

— The learned M Henri Gaidoz, in the *Revue des Deux Mondes*, advocates the reappearance of elephants on the battle-fields of Europe, and especially points to their usefulness in the artillery service, as shown by the successful experiments of the English in India. If drawn by elephants, guns of a much heavier calibre, and consequently of much greater efficacy than those commonly employed, could be used in the field. Thanks to her colonies, France could easily and cheaply procure the animals. The price of an elephant in Cochin-China, according to Ritter, varied from 150 to 200 francs forty years ago, and it is probably not higher to-day. The art of domesticating the elephant has been carried to great perfection in Cochin-China, and there the animals might receive their preliminary training. Once used to the report of cannon, they could be transported to Algeria, where their military education would be finished. Finally, sent to France, they might pass the winter under the genial sun of her southern provinces, and in summer take part in the grand military exercises at the north. Thus, in eighteen months or two years at the longest, they would be fitted for active service. Even from a pecuniary point of view, M. Gaidoz urges the introduction of elephants and their substitution, in some respects at least, for the costlier and weaker horse. Six horses are now required to draw a heavy field-piece, while guns which would throw shot 50 to 100 per cent. heavier than at present practicable could easily be drawn by two elephants. The cost of keeping them would be eight francs per day, while the cost of keeping six horses is 9 to 10 francs. Besides, the elephant is good for eighteen to seventy years of service, while the horse is worn out in ten years. Friends of the horse may still plead, however, that the elephant must for winter campaigns be acclimatized as well as tamed and drilled, and that he offers a much greater mark than the former to the enemy's projectiles. Whether elephants may fairly be employed under the terms of the Geneva convention, and whether, in any case regard should not be had for the feelings of the Prussian General Staff, are questions on which at present we suspend judgment.

HISTORICAL CRITICISM.*

MR. PAGET has no claim to be an historian, but he is a shrewd critic, who deals with isolated questions just as a skilful barrister handles the case of an opponent. 'Puzzles and Paradoxes' consists of a republication of the 'New Examen,' in which Mr. Paget sifted the evidence for several of Lord Macaulay's assertions. It consists also of fugitive pieces which hardly deserve to be published side by side with the pamphlet by which Mr. Paget earned his reputation. When meeting Lord Macaulay he was on his mettle, and did his best—and his best is certainly a good specimen of merely forensic criticism. When he does not fear his opponent, Mr. Paget relaxes his efforts and sinks from an able critic into a clever writer for the magazines. It is by his 'New Examen' that Mr. Paget should be judged. Estimated by the standard of his best work, he must be acknowledged as an enemy whom no historian dare despise. He seizes with readiness the weak points in the case which he attacks. He puts his own argument with force. He "gets up his brief" with care, and, moreover, is obviously influenced by an honest desire to meet the facts of the case. Up to a certain point, he is successful in making good his ground. After a certain point, he almost fails. His success is due to his skill in the legitimate arts of advocacy. His failure arises from his being an advocate and not an historian. The nature and extent both of his success and of his failure illustrate the function and effects of historical criticism.

It is no discredit to Mr. Paget to say that he has not the intellectual grasp of a writer who, whatever his faults, will take rank among English classics. Throughout the controversies between Mr. Paget and Lord Macaulay, you have a sense of witnessing a fight between an athlete and a warrior of twice his strength and size. But the very disparity between Mr. Paget and his opponent sets the former's success in a clear light, and shows that it is due, in great measure, to the strength of his position. Mr. Paget's strength lies in the tenacity with which he clings to the principle that no general knowledge will justify lax statement of particular facts, and that no historian, however eminent his talents, can safely make allegations which go beyond the assertions of his authorities. Take as example of Mr. Paget's mode of fighting (and of his success) the way in which he deals with Macaulay's allegation that Penn took part in the ransom of the "Maids of Taunton." The evidence in this instance lies in a nutshell; and Mr. Paget shows that it is possible, though not we think certain, that the Penn who dirtied his hands by the management of this affair was not the eminent Quaker, but a certain "Mr. Penne," whose hands were already so far from clean that they could scarcely be said to be dirtied by procuring for the Queen's Maids of Honor their ill-gotten money. Mr. Paget again throws considerable doubt on one of the specific charges made by Macaulay against Marlborough. That the great English general let the French Court know of the expedition against Brest is certain. But Macaulay, naturally indignant at this treachery, has certainly gone further than the facts warrant when he confidently asserts that the Duke was guilty "of the foulest of all treasons." His full moral guilt is, in spite of Mr. Page's pleading, still a fearful possibility; but when Macaulay asserts that "Talmash had perished by the basest of all the hundred villanies of Marlborough," he overlooks the fact that the French Court had received information of the intended attack before Marlborough sent his treacherous communication, and that the Duke possibly meant to betray rather James than William, and secure his own position by information which might gain him credit with James without in reality injuring England. This explanation of his conduct is at least possible, and, as long as such an explanation is possible, an historian is bound at least to point out its possibility. Whether, however, the favorable view of Marlborough's disgraceful intrigue is probable as well as possible, is a problem on which no one could pronounce an opinion without a comprehensive study of the life and character of the greatest of English generals and the most wily of English statesmen. It is characteristic of Mr. Paget not to perceive that the judgment formed of Marlborough's conduct in any given instance depends on considerations far wider than the special points with which his apologist deals. Macaulay may be inaccurate, and yet his general judgment of the Duke may be correct. All Mr. Paget says may be true, and yet Marlborough may for all that have been morally the murderer of his countrymen. A traitor does not cease to be a traitor because others have anticipated his treachery. Mr. Paget, even in this case, in which in our judgment he makes out his point, forgets that though an advocate may for practical purposes be content to show that his client is not proved guilty, this is a very different matter from proving that the accused is innocent. An historian is free from the technical rules of the law courts. He must in all cases take general character into consideration, and may think evidence conclusive against Marlborough which would not suffice to convict Wellington or Nelson.

Mr. Paget succeeds in dealing with single points where Lord Macaulay has been led astray either by party bias or by undue reliance on his own marvellous memory, for to defeat the historian on such points all that is needed is the skill of an advocate. But as we have said, Mr. Paget fails when he enters into discussions which require for their management more than the talents of a lawyer. He everywhere shows a tendency characteristic of a barrister, to underestimate the force of cumulative evidence, and attempts again and again to get rid of his rival's case by treating separately facts which derive their importance from being looked at collectively. This is the weak side of his otherwise able defence of Penn. It is, let us grant, probable that Penn had nothing to do with the ransom of the Maids of Taunton. It is possible that he sincerely believed in King James's most suspicious enthusiasm for toleration. His conversations with the Fellows of Magdalen are compatible with the supposition that he did not mean to suggest an ignominious surrender of rights they were bound in duty to uphold. The evidence that he conspired against William is, let it be granted, not conclusive. It is, in short, possible to make out that no one of the definite charges against Penn is so conclusively proved that a jury would, if called upon to try him, necessarily give a verdict of guilty. But if you look at the whole of his career, and not merely at the parts, the matter appears in a different light. A Quaker who is honored at court, an apostle of toleration who is the confidential adviser of one of the most intolerant bigots who ever sat upon a throne, a religious man who becomes the go-between in a discre-

* 'Puzzles and Paradoxes: Historical, Judicial, and Literary. By John Paget, Barrister-at-Law.' London and Edinburgh: Blackwoods.

ditable negotiation, occupies an ambiguous position. Macaulay may have been hasty in treating as proved charges against Penn which may possibly not be provable, but no one who weighs the whole of Penn's career can doubt that Macaulay's judgment of his character may be in the main correct, and that the great Quaker was one of those men in whose character warm philanthropy and strong religiosity were curiously intermingled with the tastes and suppleness of a courtier.

Mr. Paget's attack on William is marked by precisely the same merits and defects as his defence of Penn. It is on the whole the less successful performance of the two, because there is really little difference as to matter of fact between him and Macaulay, and everything in this instance depends on the general view taken of William's character. Both writers stigmatize the Massacre of Glencoe as an act of perfidious inhumanity. Each of them attributes a large share of its guilt to the Master of Stair. The existence and the terms of the letter from William are beyond dispute. Macaulay cannot deny that the order from the king gave in one sense an official sanction to the action of the Scotch officials. Mr. Paget cannot, we think, deny, in spite of the exaggerated emphasis which he lays upon the word "extirpate," that the letter does not of itself prove that William contemplated more than the forcible breaking-up of a band of what he may have supposed, rightly or wrongly, to be a gang of Highland marauders. The king's moral guilt depends first on the answer to the enquiry whether he did or did not know the results which would follow from his order, and, secondly, on the amount of blame due to a ruler who in perilous times does not punish rigorously enough the offences of zealous supporters. In his judgment on both points, the historian has the advantage of the advocate. The so-called "extirpation order" is exactly such a letter as must be interpreted by the character of the writer. If such a document were found among Lord Canning's papers, dated at the time when he was struggling to check the fury of the Anglo-Indians, no one would dream for a moment of thinking it inconsistent with his known humanity. Such an order signed by the First Napoleon would be naturally interpreted as the signal for a ruthless massacre. William was no humanitarian, but there is nothing in his character which justifies us in interpreting his ambiguous expressions as the instigation to one of the foulest crimes on record. The comparative immunity from punishment enjoyed by the guilty subordinates must always tell against the king, but it does not prove him a monster. Parliaments often cover by acts of indemnity deeds which no man of principle could dream of ordering. William acted in respect of the massacre neither much better nor much worse than an ordinary statesman would have acted in his place. His conduct in this matter detracts from his fame, but it does not support Mr. Paget's indictment for treachery and murder.

The truth is that on comparing the opposite judgments which honest enquirers have formed of William and Penn, we are forced to make a reflection which never seems to occur to Mr. Paget or to writers of his class. This reflection is that the different judgment formed by different minds about past events does not in many cases arise from what is called the uncertainty of history, but is due to the different estimate which, owing to the existence of varying moral standards, different men form of exactly the same transactions and characters. In other words, the difference arises, not from dispute as to facts, but from difference of moral principles. If Penn were alive, he would be held a saint by one class of men, and perhaps be thought little better than a humbug by another. William's policy would now excite the same admiration and the same invectives which it excited nearly two centuries ago. It may, perhaps, be objected that in the case of living no less than of dead statesmen, there does exist great uncertainty about the facts of their career. To avoid this objection, look at the judgments formed about such a man as Cicero. More is known of his life and character than of any other great man of antiquity. All that is known of him, and all that ever can be known of him, is open and has long been open to the examination of the whole world. Yet, now that more than eighteen centuries have passed since his death, he seems to one class of writers almost the model of an orator, a patriot, and a statesman, while, in the eyes of others, even the crimes of Catiline apparently receive some justification from that ruffian's hypothetical indignation at the success of an advocate who could excel in nothing but in his power of weaving splendid sentences. The disputes which rage about Cicero will continue as long as the world remembers the great Roman orator, or as men judge characters by different moral standards. Toward the solution of problems the perplexity of which arises from the variety of men's ethical judgments, Mr. Paget's lawyerlike acuteness can contribute nothing. But a clever cross-examiner performs important duties in the court of history no less than in the courts of law. His sharp and even captious criticism is needed to correct the errors of men gifted like Macaulay with the talents, the learning, and the imagination of an historian. The objections of Mr. Paget and of men like him are the sure test by which a great writer's assertions are tried. Criticism wears away what is untrue and unsound. The truth at last remains, and history at length pronounces something like a sound and definitive verdict on the facts of the past.

FARRAR'S 'LIFE OF CHRIST.'*

IT is necessary, in estimating the value of this large book, to bear in mind the especial purpose for which Dr. Farrar tells us it was written. After Strauss and Renan, this 'Life of Christ' is so violent a contrast as to be in some measure a disappointment. Nobody doubts Dr. Farrar's learning, of which there is the amplest evidence in these volumes themselves, and yet they seem written in boldest defiance of all good models. Their style is not simply popular, it is "sensational." To each chapter is prefixed some anticipatory quotation, as in Scott's novels—sometimes from a Greek or Latin father, again from Shakspere, or from the Bible, or from a modern poet. The picturesqueness of the narrative is increased by traditional touches derived from authorities which in the notes are repudiated. Indeed, it is scarcely too much to say that these volumes are a conspicuous example of that "mythopoic" fancy and that pardonable curiosity out of which the Apocryphal Gospels themselves arose.

But all this, and more, is accounted for by the special purpose for which Dr. Farrar wrote this book—it was written for the spiritual edification of Christian believers, and of these not for the few but the many. It is devotional, not critical; it is even picturesque rather than historical. Written at the request of his English publishers—whose aim, we are told, has long been "to spread as widely as possible the blessings of knowledge"—it is, perhaps judiciously, composed after the manner of sermons, with endless repetitions, copious verbiage, and perpetual antithesis. It is full of personal appeals and incitements to worship and utterances of passionate admiration. The "word-painting," being intended for almost scenic effect, is really scene-painting in words, and the effect is very startling to quiet students. When a note refers us from the splendors of the text to the scholarly repose of an Excursus, the relief is really astonishing.

Compare, as an example of scene-painting, the following passage with the simple words of the Evangelist—"He cried with a loud voice, Lazarus, come forth! And he that was dead came forth, bound hand and foot with grave-clothes, and his face was bound about with a napkin. Jesus saith unto them, Loose him, and let him go." This simplicity of artlessness reminds us of the simplicity of art with which Dr. Farrar is so familiar in his Greek and Roman classics. It must have been with a very painful effort that he translated the words of St. John into the sensational dialect of the nineteenth century:

"He stood at the entrance, and all others shrank a little backward, with their eyes still fixed on that dark and silent cave. A hush fell upon them all as Jesus raised his eyes and thanked God for the timely confirmation of his prayer. And then, raising to its clearest tones that voice of awful and sonorous authority, and uttering, as was usual with him on such occasions, the briefest word, he cried: 'Lazarus, come forth!' Those words thrilled once more through that region of impenetrable darkness which separates us from the world to come; and scarcely were they spoken when, like a spectre, from the rocky tomb issued a figure—swathed indeed in its white and ghastly cerements, with the napkin round the head which had upheld the jaw that four days previously had dropped in death, bound hand and foot and face, but not livid, not horrible—the figure of a youth with the healthy blood of a restored life flowing through its veins; of a life restored—so tradition tells us—for thirty more long years to life and light and love" (i. 170-171).

When the mere bulk of the Gospel narrative is increased more than fourfold, the space must somehow be filled up; and the passage quoted above reminds us that it is too often filled with untrustworthy tradition. The evidence that Lazarus lived for thirty years after his resurrection is utterly worthless—worthless historically, and more worthless still spiritually. But the necessity to be picturesque constantly misleads Dr. Farrar into a quasi-acceptance and actual use of legends and traditions for which, as he himself constantly admits, there is not a vestige of proof. This almost amounts to literary dishonesty. We may take an example from the beginning and from the end of the 'Life of Christ.'

"In the rude *limestone grotto* attached to it [the inn] as a stable . . . Christ was born" (i. 11). "How long the Virgin Mother and her holy Child stayed in *this cave* or cattle enclosure we cannot tell" (i. 15). Now, where does Dr. Farrar find "*the cave*" at all? Not in the Canonical Gospels. But his visit to the Holy Land has clearly intensified the natural desire to identify the sacred places; and the cave now covered by the Church of the Nativity at Bethlehem has almost served, in his judgment or feeling, as a real and actual verification of an utterly untrustworthy tradition.

* 'The Life of Christ. By Frederic W. Farrar, D.D., F.R.S., late Fellow of Trinity College, Cambridge; Master of Marlborough College; and Chaplain in Ordinary to the Queen.' In two volumes. New York: E. P. Dutton & Co. 1874.

He refers to Justin Martyr as a kind of authority for that tradition; but Justin Martyr says not only that Christ was born in a cave, but that he was not strictly born in Bethlehem at all. "When the child was born in Bethlehem," he says, "since Joseph could not find a lodging *in that village*, he took up his quarters in a certain cave *near* the village" ("Dialogue with Trypho," sec. lxxviii.). In fact, so far as Justin Martyr is concerned, his acceptance of this legend clearly results from his curious explanation of Isaiah xxxiii. 16 (lxx.), as may be seen by comparing sections lxx. and lxxviii. of the "Dial. c. Tryph."; and the legend itself is taken from the Apocryphal Gospel of James, belonging probably to the middle of the second century (see Gospel of James, chap. xviii.)

The other example is from Dr. Farrar's account of Christ's trial before Pilate. "His own wife—Claudia Procula—ventured to send him a public message, even as he sat there on his tribunal, that, *in the morning hours, when dreams are true*, she had had a troubled and painful dream about that Just Man" (ii. 375). The words in italic are a translation of σήμερον. Dr. Farrar adds, in a note, "Her name is given in the Gospel of Nicodemus, which says she was a proselyte." But of what possible authority is the Gospel of Nicodemus? Will Dr. Farrar accept the preposterous rubbish which purports to be a narrative of Christ's descent to the under-world on the same authority? It was certainly not necessary for him to write a critical 'Life of Christ'; but surely the inevitable difficulties of the four Evangelists are quite sufficient, without those of the Protevangelium and the Gospel of Nicodemus.

Much liveliness is imparted to Dr. Farrar's narrative by illustrations from the Talmud, from which lively illustrations it may be well to take refuge occasionally in the quiet scholarship of Excursus xii.: "Anything more utterly unhistorical than the Talmud cannot be conceived. It is probable that no human writings ever confounded names, dates, and facts with a more absolute indifference. The genius of the Jews is the reverse of what in these days we should call historical" (ii. 485–491).

Die altdeutsche Reichs- und Gerichtsverfassung. I. Band. Die fränkische Reichs und Gerichtsverfassung. Von Rudolph Sohm, ord. Professor an der Universität Freiburg i. Br. (Weimar: Böhlau; New York: B. Westermann & Co.)—Although the first volume of Professor Sohm's work appeared in 1871, it is not too late to call attention to its value, more especially since the second volume will soon appear, and can hardly be appreciated without some preliminary examination of the first, and some idea of the results already established by it. If any further apology is needed, it is enough to say that works such as this are apt to remain new for a great many years. Dr. Sohm, who is now professor of law at the University of Strassburg, was already known within the narrower circle of Continental students for various essays published in periodicals, as well as for a small work on the 'Process der Lex Salica,' which has a great interest and value in connection with the early history of Germanic institutions. In these preliminary studies he laid the foundations of the great work now in course of publication, in which he proposes to explain the political constitution and judicial organization of all the Germanic races, excepting only the Norse. He begins with the Franks, and this part of the subject occupies his first volume, although occasionally the reader will find in this volume, in connection with some particular Frankish institution, suggestions of the author's theories in regard to the corresponding institution in other Germanic tribes.

The great national publication known as the 'Monumenta Germaniæ Historica' of Pertz, in its volumes containing the 'Leges,' and the private but scientific editions of the 'Leges Barbarorum,' supplemented by the labors of Pardessus, Merkel, Richthofen, etc., have at length given the historian a solid foundation by supplying him with texts established according to the strict laws of sound criticism. Within the last twenty years, Germany has produced in this field of Germanic constitutional law not only innumerable learned monographs, but several works of the first class, such as those of Maurer, Bethmann-Hollweg, Gierke, and especially of Waitz and Roth. Prof. Sohm takes as his starting-point the four books of the two last-named authors: the 'Verfassungsgeschichte' and the 'Vassilität' of Waitz, and the 'Beneficialwesen' and the 'Feudalität' of Roth—works which are indispensable to every student of Germanic institutions; but while taking them as his starting-point, Sohm differs from their conclusions in some very important respects.

It is well known that the ancient Germans had three different kinds of public assembly for performing the necessary public business, whether religious, political, or judicial. They are known as the assembly of the confederation, of the tribe (the *concilium* of Tacitus), and of the hundred. It is agreed that these were of unequal importance so far as the number of members in each was concerned, but it has been believed that all were equally competent to deal with all those interests, religious, political, and judicial, which constitute the public duties of every people so far back as we can penetrate into history. And from this the conclusion was drawn that the ancient Germans, too ignorant to distinguish these public interests according to their nature, had no idea of the difference which exists between public and private law any more than they had of the division of powers into religious, political, legislative, and judicial; in short, that notwithstanding the admitted existence of three separate assemblies, the Germanic constitution offered a striking example of unity and simplicity. Prof. Sohm shows in the introduction and first part of his book that the assembly of the confederation united by a religious tie all the peoples or tribes which retained the tradition of a common origin. These tribes had the same sanctuaries. Their assemblies were for the satisfaction of religious duties. The tribal assembly, the *concilium* of Tacitus, united in one single permanent association the freemen who had the same political interests, and its political jurisdiction excluded that of any other assembly. This is the *civitas* of the Germans, their political organ. And finally, in the assembly of the hundred were regulated all judicial relations, under the presidency of a magistrate elected in the *concilium* or political assembly. The hundred court was therefore the peculiar and exclusive law-court of the ancient Germans. In the mechanism of this constitution the king performed no very important work. Where the king existed at all, he was merely a man, noble by birth, whom the people elected in their tribal assembly to appear as their representative. The king's functions before the epoch of invasion were functions of honor.

The author's demonstration of these theses is very well done, and seems to us convincing. He then proceeds to the foundation of the Germanic kingdoms on Roman soil, and shows what became of the ancient assemblies. The religious assembly disappeared. The *civitas* was replaced by the warlike association of tribes which had united for purposes of conquest. These confederations were the nucleus of the various German kingdoms, Frankish, Burgundian, Lombard, and the rest. As for the assembly of the hundred, with its judicial functions, it survived through all historical vicissitudes. This is an original idea of Prof. Sohm's, and he verifies it by numerous citations. This historical phenomenon is studied with peculiar care, and the author concludes by saying that the judicial organization of the hundred which existed in the epoch of Tacitus, "survived the storms of the folk-wanderings, the kingdom of Clovis, the reforms of Charlemagne, the dissolution of his empire, the dissolution of the shire constitution, the dissolution of the public authority by feudalism, and only succumbed to a more powerful enemy, the awakening German science of law in the sixteenth century."

The study of the Germanic constitution, as exhibited in the Lex Salica, forms the transition between the epoch of Tacitus and that of the Merovingians and Carlovingians. In some respects, the Lex Salica belongs to the earlier, in some to the later period. It is in this part of his book that Prof. Sohm has made most use of the results gained in his earlier investigations. The contrast between the old state of things and the new appears principally in the union of the rights of sovereignty in the hands of the Frankish king, and in the influence of the king on the political and judicial organism through the intermediate agency of the counts or grafs, "those first modern functionaries." The extent of his functions, and the relation of the count to the king, are examined in detail in the second part of the book.

This volume, the first of a series which, if it keeps its promise, will be one of the most admirable works that have ever appeared on the history of institutions, contains also several studies on minor points which the author has put in the Appendix I. The Appendix II. makes use of the last results obtained by philologists, especially by Kern ('Die Glossen in der Lex Salica,' etc. Haag. 1869), in explanation of the German words found in the 'Lex Salica,' to establish the relation between the so-called Malberg gloss and the *legis actio* of the oldest Roman procedure. This is not the least interesting of these monographs, which have all been recently translated by M. Marcel Thévenin, and added as appendix to his translation of Sohm's 'Process der Lex Salica,' lately published in Paris. If a fault must be found with Professor Sohm, we are tempted to say that he makes too much parade of erudition and really abuses the right of citation. His knowledge of texts is very deep and has no need of proof. The number of notices, references, etc., fatigues the reader, and, what is of more consequence, incessantly breaks the thread which connects the different parts of his argument. This is, however, a slight fault. The book is all the same a great work, one of the best and most scientific within our knowledge.

History of the Descendants of John Dwight, of Dedham, Mass. By Benj. W. Dwight. Two vols. in one, pp. xxx.–1,144. (New York: Printed for the Author. 1874.)—Everybody has heard the story of De Tocqueville's amazement on learning that the little yellow spot on the map called Connecticut was the parent hive of so many Congressmen, representing all parts

of the United States. Something of the same feeling is excited in one who runs through the index to this bulky volume, and endeavors to imagine a surname which is not recorded as having some connection, near or remote, with John Dwight, of Dedham, Mass. And if he turns to the author's "General Summary of Results" he will still experience a lively surprise on learning that "one-sixtieth of all the liberally-educated people of the land [graduates of American colleges] have been connected by blood or by marriage with the history of two of its families [Dwight and Strong], and one of them [Dwight] of very moderate dimensions." Of this sixtieth, "more than 350 have been graduates of Yale, or about a twenty-fifth of all its alumni." We need not push our enquiries further as to the quality of the stock of which such an exhibit can be made. A glance at the early generations of Dwights, in one line, is enough to show that we are dealing with a remarkable family, and one possessing the best characteristics of New England Puritanism. We pass over John Dwight, the emigrant, who "is described in the Town Records of Dedham as 'having been publicly useful,' and 'a great peace-maker,'" with the remark that his easy circumstances ("he was the second man of wealth in Dedham") doubtless had much to do with the position and culture of his immediate descendants. His son, Capt. Timothy, had the civic virtues of his father, held many offices of trust, fought against the Indians, and found time, in a brief career of eighty-eight years, to marry six wives. Next comes Justice Nathaniel Dwight, of Hatfield and Northampton, whose removal to the Connecticut Valley gave a new and important turn to the family development, and who fully maintained the inheritance of his father and grandfather. His first-born, Col. Timothy Dwight, was a lawyer and judge, who acquired his military title in the old French war, when the building of Fort Dummer was entrusted to him. He was of medium size, but very strong, and the author tells of him the incredible story (though vouched for by report from President Dwight) that he once "threw a stone not only across the Connecticut at Northampton, which was some forty rods from the point where he stood, but thirty rods more beyond, or 1,165 feet in all." This physical vigor he transmitted to his son, Major Timothy Dwight, who was born at Fort Dummer, and so took naturally to soldiering. He was truly a giant, standing six feet and four inches high, and was capable on occasion of stopping an ox-team in full motion by holding back the wheels. He was a judge of probate for sixteen years, and also held other offices. Of him it is related that having been entrusted with a certain number of Princeton College lottery tickets to sell, on condition of paying for those not sold or not returned and accounted for, he set aside one as his own venture, and neglected to return the remaining nineteen; and when one of these proved to have drawn the highest prize, and that for £4,000, he refused to avail himself of his privilege of buying in the nineteen, and cheerfully paid the price of his chosen blank. He married Mary, the daughter of the famous Jonathan Edwards, by whom he had thirteen children; the eldest, another Timothy, better known as President Dwight, of Yale, of whom it is stated on p. 165—we do not know with how much probability—that "his name is used, it is believed, more abundantly in New England, and the Northern States generally, as a baptismal name, than any other name in the land, beside George Washington's; and it is not certain that that should be excepted." The author of 'Travels in New England' is too familiar a character to need that we should dwell upon him here.

Among the well-known men of Dwight parentage or connection by marriage of the present day we may mention President Theo. D. Woolsey, Prof. Jas. D. Dana, Dr. Leonard Bacon, Prof. W. D. Whitney, Hon. Geo. Bancroft, Geo. S. Hillard, Prof. F. J. Child, Chas. Eliot Norton, David A. Wells, Judge Geo. Hoadley, James T. Gardner, etc., etc. The college-graduates from first to last represent twenty-seven different institutions: Yale counts 144, Harvard 71, Dartmouth 33, Williams 26, all others less than twenty—West Point 6. "The great area of family-expansion lay wonderfully, for nearly two centuries, along the line of the Connecticut River, within the range of a dozen miles on either side of it. At Springfield it had a large mercantile development; at Belchertown, an agricultural one; and at New Haven, Conn., one scholarly and professional." In the last-named class of families marriages have generally been late, and births not frequent. "The mortality that marked the larger families of Dwights in earlier times is certainly quite observable. It is believed that the history of other families in the land was of a similar type. If so, the statement is not worthy of acceptance that, inasmuch as our fathers were hardier than we, so their families were healthier and longer lived than those brought up amid modern refinements."

We could give, if we should try, but a faint idea of the amount of labor involved in the preparation of this book, which is the more extraordinary as it is the second one of the kind successfully carried through by the author on a grand scale. Genealogies belong at best in the class of *travaux longs et durs*, and the burden is immensely increased when the attempt is made, as here, to follow up the female lines as well as the male. Our author seems hardly warranted in his censure of those genealogists who have attended to the male lines solely. This justification is to be found in the fact that life is short, and that the field of research must somewhere be marked out with reference to human endurance and to perspicuity. Nobody will regret that Mr. Dwight has gathered so much as he has done between two covers, but he, too, has had to fix limits for himself, and he has not avoided an obscurity of arrangement which contrasts unfavorably with similar works that we could name. A few other trifling criticisms might be made if we were not aware that no amount of praise that he is likely to get for his disinterested endeavors, and no pecuniary return, could compensate the author for the drudgery of this compilation. Those only who have dabbled in the same fascinating pursuit can appreciate the physical cost of so vast an undertaking, or enter into the spirit which prompted him to commence it and sustained him to the end.

EDITED BY

EDWARD E. MORRIS, M.A.

Histories of countries are rapidly becoming so numerous that it is almost impossible for the most industrious student to keep pace with them. Such works are, of course, still less likely to be mastered by those of limited leisure. It is to meet the wants of this very numerous class of readers that the 'Epochs of History' has been projected. The series will comprise a number of compact, handsomely-printed manuals, prepared by thoroughly competent hands, each volume complete in itself, and sketching succinctly the most important epochs in the world's history, always making the history of a nation subordinate to this more general idea. No attempt will be made to recount all the events of any given period. The aim will be to bring out in the clearest light the salient incidents and features of each epoch. Special attention will be paid to the literature, manners, state of knowledge, and all those characteristics which exhibit the life of a people as well as the policy of their rulers during any period. To make the text more readily intelligible, outline maps will be given with each volume, and where this arrangement is desirable they will be distributed throughout the text so as to be more easy of reference. A series of works based upon this general plan cannot fail to be widely useful in popularizing history as science has lately been popularized. Those who have been discouraged from attempting more ambitious works because of their magnitude, will naturally turn to these 'Epochs of History' to get a general knowledge of any period; students may use them to great advantage in refreshing their memories and in keeping the true perspective of events, and in schools they will be of immense service as text-books—a point which shall be kept constantly in view in their preparation.

NOW READY,

VOLUMES I. AND II. OF THE SERIES.

THE ERA OF THE PROTESTANT REVOLUTION.

BY F. SEEBOHM,

Author of 'The Oxford Reformers—Colet, Erasmus, More.' 1 vol. 16mo, with outline maps, cloth, $1.

THE CRUSADES.

BY REV. G. W. COX, M.A.

Author of the 'History of Greece,' 'War,' etc. 1 vol. 16mo, with outline maps, cloth, $1.

*** *For sale by all booksellers. Sent post-paid on receipt of price by the publishers,*

SCRIBNER, ARMSTRONG & CO.,

No. 654 Broadway, New York.

THE WEEK IN TRADE AND FINANCE.

NEW YORK, August 24, 1874.

MONEY continues to rule easy at 2 to 3 per cent. on call, with the bulk of business doing at 2½ per cent. Commercial paper is in excellent demand at 5 and 6 per cent. for that having a short time to run, and at 6 to 7 per cent. for 3 and 4 months paper.

The Bank of England minimum discount rate was reduced on Thursday at the weekly meeting of the directors from 4 to 3½ per cent. The Bank gained £683,000 in bullion during the week.

The statement of the Clearing-House banks of this city for the week ending August 22 was unfavorable, showing a further reduction of $2,720,950 in the net surplus reserve—the banks now holding $26,730,275 in specie and legal-tenders over and above the amount required to be held by law against their liabilities; the surplus the previous week was $29,451,225.

The following shows the relation between the total reserve and the total liabilities:

	August 15.	August 22.		Differences.
Specie	$22,352,000	$19,554,900	Dec..	$2,797,100
Legal tenders	66,578,100	65,891,400	Dec..	686,700
Total reserve	$88,930,100	$85,446,300	Dec..	$3,483,800
Reserve required against deposits	59,478,875	58,716,025		
Excess of reserve above legal requirem't,	29,451,225	26,730,275	Dec..	2,720,950

During the past week stocks have advanced from one to three per cent. on the speculative share list. The most active dealings have taken place in Lake Shore, Western Union, Union Pacific, and Pacific Mail.

Milwaukee and St. Paul and the Northwestern stocks have remained steady, not sharing to any great extent in the rise which took place in the general list, owing to the pending litigation between them and the State of Wisconsin, which still remains undecided.

The investment stocks are all strong, although the demand for them has been limited. Delaware, Lackawanna and Western advanced to 103, at which figure a few hundred shares only changed hands. A semi-annual dividend of 5 per cent. has been declared upon the stocks of the Chicago, Burlington and Quincy, and the Burlington and Missouri River Railroad Companies, payable on the 15th of September; these two roads being both under the same management by the perpetual lease of the Burlington and Missouri by the Chicago, Burlington and Quincy.

In the Government bond market a moderate amount of business has been doing, the principal demand running on the old 10-40's for home account. Prices at the close of the week were a fraction higher as compared with those of the previous Saturday. The market closed this evening at the following quotations:

	BID.	ASKED		BID.	ASKED
Registered 6's, 1881, c	118⅜	118⅝	Registered 5-20, 1867, c	117⅝	117⅞
Registered 5-20, 1862, c	112¾	112¾	Registered 5-20, 1868, c	117¾	118
Registered 5-20, 1864, c	116	116¼	Registered 10-40's, c	114⅜	114¾
Registered 5-20, 1865, M and N.	117⅛	117⅜	Registered 5's of 1881	112⅜	112⅝
Registered 5-20, 1865, J and J	116⅛	116¾	U. S. Currency 6's	117⅜	117¾

The gold market has remained quiet and steady, the price fluctuating between 109½ and 110. The dulness which exists at present in the Gold-room is best shown by the statement of the Gold Exchange Bank of the amount of clearings for the past week, which, in round figures, was $92,500,000, against $128,500,000 for the corresponding week of last year. The shipments of specie during the week amount to $693,229. On Thursday the Treasury sold only $1,250,000, on account of the low prices of many of the bids. The total amount bid for was $4,733,000.

The following shows the range of gold quotations for the week ending August 22:

	Opening.	*Highest.*	*Lowest.*	*Closing.*
Monday, Aug. 17	109⅜	109⅝	109⅜	109⅝
Tuesday, Aug. 18	109⅝	109⅝	109⅝	109⅝
Wednesday, Aug. 19	109⅝	109⅞	109⅝	109¾
Thursday, Aug. 20	109⅞	109⅞	109⅝	109⅞
Friday, Aug. 21	109⅞	110	109⅞	109⅞
Saturday, Aug. 22	109⅞	110	109⅝	110

SPECIAL NOTICES.

TERMS: In advance, one insertion, four cents per word; five insertions, three cents per word, each. The enclosure of a stamped and addressed envelope will secure a numbered box, to which communications may be addressed.

A Harvard Graduate, Private Tutor in Cambridge, wants a pupil for the coming College year. Has experience and city references. Address Box 16, *Nation* office.

A Graduate of Harvard College would like two or three Pupils to fit for College or otherwise. Best references. Address Box 17, *Nation* office.

A Vassar Graduate of three years' experience in teaching, desires a situation in a select school. Refers to the Faculty of Vassar College. Address, Box 15, *Nation* Office.

A Graduate (with Classical Fellowship) of Princeton, who has studied abroad, takes in New York or vicinity private pupils preparing for college. References. Address Box 14, *Nation* office.

An Oxford M. A., of many years' experience in teaching in England and America, desires a situation as a Classical Master. Would prepare pupils for the English or American Universities. High references given on application to H. H., 1912 Latona Street, Philadelphia.

An Experienced Principal, College-bred, desires position. Address, stating salary, EXPERIENCE, *Nation* office.

A Teacher with Experience (ten years in music, four in drawing and painting) wishes employment in a school. MARTHA H. JONES, Meredith Village, N. H.

A Class for Young Gentleman, and Private Instruction. Circulars sent on application. THOMAS R. ASH, 17 East Sixteenth Street.

Partner with Capital Wanted.—To Manufacture Hardwood Lumber, and also to deal in Pine Uppers. An active and experienced business-man preferred. Best of references given and demanded. Address 'iCumberman," 27 East Seventy-fourth Street, New tYork 'Ly.

Excellent Governesses for Families in abundance. Please address "TEACHERS' AGENCY," Rev. L. W. Applegate, Mauch Chunk, Pa.

Wanted.—A position as Editor on a Liberal or Democratic paper, by a gentleman of collegiate education and some experience. Best of references. Address Box 13, *Nation* office.

SPECIAL NOTICES.

TERMS: In advance, one insertion, four cents per word; five insertions, three cents per word, each. The enclosure of a stamped and addressed envelope will secure a numbered box, to which communications may be addressed.

Wanted.—A Gentleman of literary attainments, and with some capital to put in, desires to make a business connection with some established Publishing House. Address J. T. B., Box 407, Medford, Mass.

Those Seeking Admission to Harvard, Yale, or any other American College, to Sheffield or Lawrence Scientific School, or any School of Technology, can receive thorough preparation at ROGERS HIGH SCHOOL, Newport, R. I. Special provision made for Laboratory Practice. Tuition, $60 per annum. Frederic W. Tilton, A.M. (late Principal of Phillips Academy), Head-Master.

Books for Sale.—Very fine copy "Breeches" Bible, title and two pages mounted. Folio, calf, rebacked, gilt. London, 1595. Price $30. Address LAWRENCE B. THOMAS, bookseller and stationer, 55 West Fayette Street, Baltimore.

For Sale.—Vols. X. to XIV. of the Nation inclusive, bound in boards, with red-leather backs. Price $2 50 each if taken together. Address the Publisher, Box 25, New York.

Mr. George Street, London, Agent of the *Nation* for Great Britain, receives Subscriptions and Advertisements for this paper. GEORGE STREET, 30 Cornhill, London, E.C.

No. 369 of the *Nation* wanted (dated July 25, 1872), for which 15 cents will be paid. Address the PUBLISHER, Box 25, New York.

Photography. — Three English Cameras complete, with Lenses, etc., etc., the most perfect yet produced; two for plates, 7¼ x 4½ in. (ordinary and pantoscopic), and one for 10 x 10 and less—the most comprehensive assortment of lenses and accessories possible. Instruction given for either at or near Boston or New York. Address W. J. STILLMAN, care Publisher of the *Nation*.

School of Mines, Columbia College.— Courses in Mining and Civil Engineering, Geology, Mineralogy, Chemistry, Assaying, etc., etc. Send for catalogue. C. F. CHANDLER, Dean of Faculty, East Forty-ninth Street, New York.

Sheffield Scientific School of Yale College. Information by addressing Prof. G. J. BRUSH, New Haven, Ct.

SPECIAL NOTICES.

TERMS: In advance, one insertion, four cents per word; five insertions, three cents per word, each. The enclosure of a stamped and addressed envelope will secure a numbered box, to which communications may be addressed.

Elmira Female College.—This is a college of the highest rank, for well-prepared students. It has also Eclectic and Preparatory Departments, and superior instruction in Music and Art. Terms moderate. Send for catalogue to Rev. A. W. COWLES, D.D., Elmira, N. Y. Next session begins September 9.

Rutgers College Grammar School, New Brunswick, N. J. Thirty-one boys admitted to College from this School last commencement. 104th year begins Sept. 8. Circulars free. Rev. ABRAHAM THOMPSON, A.M., Rector, Prof. D. T. Reiley, A.M., Associate Rector.

University of the City of New York.— Medical Department. Address PROF. CHAS. INSLEE PARDEE, M.D., 426 E. 26th Street., New York City.

Union University.—Law School at Albany, N. Y. For Circulars make application to ISAAC EDWARDS, Esq., Albany, N. Y.

Wesleyan Female College, Wilmington, Delaware, offers thorough instruction in a liberal course of study, under home-like influences, at reasonable expense. Session begins September 10. Rev. JOHN WILSON, A.M., President.

Bellevue Hospital Medical College, City of New York, session of 1874-75. The Collegiate Year in this Institution embraces a preliminary autumnal term, the regular winter session, and a summer session. The Preliminary Autumnal Term for 1874-75 will commence on Wednesday, September 16, 1874, and continue until the opening of the regular session. During this term instruction, consisting of didactic lectures on special subjects and daily clinical lectures, will be given, as heretofore, by the entire faculty. Students designing to attend the regular session are strongly recommended to attend the preliminary term, but attendance during the latter is not required. During the preliminary term, clinical and didactic lectures will be given in precisely the same number and order as in the regular sessions. The Regular Session will commence on Wednesday, September 30, 1874, and end about the 1st of March 1875. For the annual circular and catalogue, giving regulations for graduation, and other information, address the Secretary of the College, Prof. AUSTIN FLINT, Jr., Bellevue Hospital Medical College.

American Families Going Abroad for some years' residence may be glad to know of a safe home in England, and gentlemanly training, with good teaching for their young sons. Such a home and such training is offered by Mr. Ernest H. Coleridge (M. A. Balliol College, Oxford), Beomonds, Chertsey, Surrey. A delightful place, with fresh air and genial climate; the house large and well adapted for school purposes. An American friend of Mr. Coleridge's, Mr. Ellis Yarnall of Philadelphia, will be glad to furnish further information.

The Nation.

NEW YORK, THURSDAY, SEPTEMBER 3, 1874.

The Week.

THE Tennessee whites have given renewed illustration, during the past week, of their determination to prevent the insolent black man from attempting to maintain his impudent assertion of equality —the means taken being the hanging of a few helpless, utterly defenceless negro prisoners by a large mob of armed men. The negroes, to the number of sixteen, who were confined in the Trenton jail on a charge of kidnapping, were taken out by this mob about two o'clock on the morning of the 26th ult., the jailer having been frightened into letting them into the prison. Firing was afterwards heard, and four negroes were found to have been shot dead and two wounded, ten remaining unaccounted for, whose bodies are said to have been afterwards found in the river-bottom. The pretext for this wholesale murder was the usual story, circulated in the neighborhood, that the blacks were on the point of rising; that "400 or 500 armed negroes were marching into town to burn the buildings and kill the people"; that a hundred negroes had been seen, "a portion armed, cleaning up everything"; that the negroes were "standing around groups of white men trying to ascertain what they were talking about"; and that the negroes were "organized over the entire country." On the circulation of these reports there was the usual excitement among the whites, who assembled from all quarters, to the number of 1,000 men, ready to sell their lives dearly; but, strange to say, the opposing negro army could not be discovered anywhere, "fourteen negroes, a portion armed," being the only trace of an African rising to be found in the country. The discovery of this foe produced no effect on the courage of the white troops, and all of the fourteen who had weapons were disarmed, only one resisting, who "came very near being shot." A great meeting was then held, and speeches were made deprecating any ill-feeling between the races and the murder of them by masked men.

It is only fair to say that the respectable people of Tennessee are as much disgusted and horrified at such outrages as this as respectable people are in any part of the country. The Memphis *Appeal*, a strong Democratic paper, says that the lynching was as unnecessary as it was barbarous, and makes the sensible observation that as the whites in Tennessee are a thousand to one in moral and physical force to the negro, and also in possession of the State and of all the machinery of government, there seems no particular reason why the present moment should be selected for subverting and defying the laws. The Governor of the State has determined, it is said, to make an example of the outlaws who did the lynching; and we can assure him that he could not do a better thing either for his party, or for the State, or for the country at large. Southerners are now making great efforts to build up the industries of their section, and what they need more than anything else is a supply of cheap labor, which they can expect to attract only by a quiet and orderly state of society. They succeed, however, about this time of year, by the help of their correlative and opposing Northern agitators—who, like Frederick Douglass, want to have an extra session of Congress called to deal with the local disturbances arising from the savage and half-civilized character of the population—in giving a picture of the country which will encourage few people to help them revive anything there. Fights like that between Jones and Bowley in South Carolina lead one-half of the North to say for themselves, There is no help for it, the South is becoming another Africa; and lynching like this in Tennessee leads the other half to the conclusion that nothing short of exterminating every one who has a shade of color in his skin will satisfy the whites.

Conventions were held last week in Illinois, Missouri, Ohio, Pennsylvania, Kansas, and other States. The platforms are of little interest except as they touch upon the currency and kindred questions. In Pennsylvania, the Democrats are in favor of bringing the legal-tenders to par with gold, and returning to specie payments "at the earliest possible period that resumption can be effected with safety." The Illinois Liberals and Democrats declare themselves in favor of a revenue tariff; the restoration of gold and silver "as the basis of the currency"; and of resumption at the same time laid down by the Pennsylvania Democrats; and that they are opposed to inflation and in favor of paying the national debt in the money of civilized countries. The Ohio Democrats, on the other hand, resolved "that a sound currency is indispensable to the welfare of the country"; that "its volume should be regulated by the necessities of business"; that "all laws that interfere with such natural regulations are vicious in principle and detrimental in their effects"; and announce themselves "in favor of such an increase of the circulating medium as the business interests of the country may from time to time require." They are also of opinion that one-half the customs duties should be payable in greenbacks; that the national banks should all be abolished as soon as possible, and legal-tenders substituted for the notes; that the 5-20's ought to be paid in greenbacks; and that the act of 1869, pledging payment in gold, was a "wicked sacrifice" of the interests of taxpayers. The Missouri Democrats announce the same opinion with regard to the 5-20's; favor the abolition of the national banking law, and the substitution of legal-tenders for the notes, but are plainer-spoken with regard to the intention of this scheme than their Ohio brethren, for they say that by this means $24,000,000 annual interest will be saved to the people; they are opposed to a paper currency, and think that the way to get back to specie payments is by making legal-tenders receivable for duties on imports. The Missouri, Indiana, and Ohio Democrats stand upon the same ground, and their resolutions show that they have learned nothing from their struggles and misfortunes during the past fifteen years. The resolutions in the other States are not of much importance, and, taking them together, they cannot be said to foreshadow anything very distinct, though, as between the two parties, the Democrats make, all things considered, the worse appearance.

The Louisiana Conservatives, forming a combination of all the parties opposed to Kellogg, have held their convention, made a nomination for state treasurer, and adopted resolutions declaring the existing government a fraudulent despotism; denouncing the Radicals for inflaming the passions of the negroes against the whites, and declaring the necessity forced upon the white people of acting together "in self-defence, and for the preservation of white civilization"; that "the rights of all men under the Constitution and the laws of the land must be respected and preserved inviolate, irrespective of race, color, or previous condition." They deny that Congress has any power to pass measures making social equality between the races compulsory; disclaim any intention of violence toward the negroes; and declare that they expect the assistance of a large colored vote. They promise payment of the just, and repudiation of the dishonest and fraudulent, debts of the State, and assure their friends that all they mean to do is to secure reform by putting honest and capable white men in office. The election in Louisiana will be of a good deal of importance, as the whites and blacks are very evenly matched,and it seems quite likely that, with a fair election, a good many blacks might appear on the Conservative side. The latest news from Louisiana is of the murder of several white Republicans, near Coushatta, in cold blood.

In the Essex District in Massachusetts, General Cogswell, mayor of Salem, announces his willingness to run against Butler

for the Congressional nomination. His platform is that the Republican party must take an honest and pronounced stand on the currency question, that specie payments must be resumed as soon as possible, and that, while not insisting on any particular plan, he would oppose all postponement of a settlement of the means to be used, as he would also any inflation. He would reform the present condition of the civil service and the abuses of patronage, and on the railroad question he actually says, in so many words, that he does not believe in the recent Western legislation, but thinks it ought to be revoked, "for it is unjust to those who have in good faith invested their money in railroad enterprise." What General Butler will do in this district does not yet seem to be settled; but, whatever he does, we sincerely trust that General Cogswell's nomination may be secured.

Mr. Hugh McCulloch has written a letter on the financial question to a number of prominent citizens of Cincinnati. He recognizes the supreme importance of the adoption of a settled policy, and suggests as a practical plan of resumption, first, that Congress should fix a period, say the 1st of December, 1876—or any other date not far off—after which United States notes should cease to be a legal-tender; second, that the Secretary of the Treasury should be authorized to retire (by the use of the surplus revenue, and, if this should be insufficient, by the sale of bonds) at least $50,000,000 of United States notes per annum, until all have been retired, and be prohibited from reissuing the notes thus retired, under any pretext or circumstances whatever; third, that in lieu of the United States notes retired, an equal amount of bank-notes, if they should be required, should be issued to national banks; fourth, that when the specie standard has been re-established by the repeal of the legal-tender acts, banking should be made free, and Congress should cease to interfere with the currency except so far as may be necessary to prevent illegal issues and to provide that the money in circulation by authority of law shall be secured beyond contingency, as is now the case, by a deposit of United States bonds in the Treasury. Mr. McCulloch, it is hardly necessary to say, is sound on the subject of repudiation.

The renomination of General Dix having apparently been decided upon by the New York Republicans, an effort is making to damage his reputation by showing that he was "mixed up" in the Crédit-Mobilier swindle. The facts about the connection of General Dix with the Crédit Mobilier seem to be these: He was at one time president of the Union Pacific Railroad Company, which was certainly a misfortune, as things turned out, for anybody, but is not, so far as we understand it, yet recognized even by the strictest moralists as in itself a crime. When he left the presidency, being then Minister to France, he had an unsettled account with the Company, his salary being in arrears; and, the settlement of the matter being left in the hands of his friends, the Company liquidated their debt to him by the payment of $50,000. While in office, he as president approved of the extension of the Hoxie contract, under which the road, or part of it, after the contract had been assigned to the Crédit Mobilier Company, was actually built. He never derived any benefit from the contract, nor owned any Crédit-Mobilier stock. The way in which these facts have been presented to the public is this: That Dix blackmailed the Company and got $50,000 by writing a threatening letter, and that he afterwards refused to appear before the Investigating Committee—a charge which has not a shadow of foundation, inasmuch as some communications of his recently published show that he was ready, and even more than ready, to go before the committee, but they did not order him to appear.

The Crédit-Mobilier scandal seems now to have reached that stage in which the facts have been pretty much all forgotten, but the association of anybody's name with the investigation throws a haze over his reputation—any discrimination between innocence and guilt being at this distance of time inconvenient and tiresome. It may, therefore, not be out of place here to say that the people who were really found guilty of heinous offences were those Congressmen who, being in a position of trust and profit with regard to the Pacific roads (*i.e.*, being members of a body from which the road really got all its aid), took an interest in a contract made by and among the directors, and involving the interest of the Government, without any proper enquiries as to its nature, and with every reason to believe, as the event showed, that they were getting an opportunity to make money out of the Government of which they were a part, solely by reason and in consideration of their position. As to General Dix, the Republicans, if they want to keep the control of the State in their hands, cannot do a better thing than make the nomination of him. Of all the politicians brought to the surface by the Reform movement, he is almost the only one who has managed to strengthen instead of impairing his good fame while in office, and he is almost the only man who, in this city, would call out what we might call the respectable and disgusted vote.

The committee of Plymouth Church has made its report on the Beecher-Tilton case, acquitting Mr. Beecher on all points. The verdict is a proper one on the evidence submitted. No tribunal could have reached any other conclusion. But the report itself makes no pretence to be judicial in tone. On the contrary, it says exactly what we might have expected certain friends of Mr. Beecher to say who had been asked by him to look into certain charges made against him by a man they despised, and who had done their work with the strongest presumptions in their pastor's favor. There is nothing surprising about this. It is what the public must have been prepared for. We are bound to say that we think they present a fair history of the case, but the summing up is that of counsel, not of a judge. The report was read to a crowded and excited meeting of the church on Friday evening, at which, after a review of some points of the case by Professor Rossiter W. Raymond, the conclusions were adopted by a unanimous vote, Moulton, the Mutual Friend, who was present, alone saying nay. He interrupted Professor Raymond by giving him the lie, and on leaving the church at the close came near being mobbed. He is, as might be expected, very angry, and is preparing another "statement," in which he promises to finish Beecher. Tilton is preparing one too, and what with these and the lawsuits the case promises to drag on until Christmas. It is of course Tilton's interest to keep it alive as long as possible, as its close will leave him in degraded obscurity, and Moulton is now so furious that he will keep on throwing mud at Beecher as long as any of it can be made to stick, but we hope the respectable papers will not give the pair any further facilities for keeping themselves before the public. Moulton's own account of his doings puts him beneath decent people's notice. We trust, too, that in any legal proceedings taken Mr. Henry C. Bowen will be somehow put into the hands of a skilful cross-examiner. The escape of this worthy thus far is one of the most discreditable features in the investigation. The temporary suspension of the business of "bringing souls to Christ," in which he says he is engaged, would be a cheap price to pay for having him turned inside out by a remorseless and practised hand in open court.

The discussion of the emigration question still continues, both in the English and in our papers. The "Bohemian" whose letters on the subject we lately noticed, and who drew such a doleful picture of his adventures in America, has been replied to from all sides, and so many of his statements have been shown to be utterly wild that his evidence must be considered worthless. The "Society of the Sons of St. George," however, at Philadelphia, have published a much-needed "caution to emigrants," in which they say that for the three months ending with the 23d of July, out of 450 applications to the Society for relief, "a large proportion have asked to be assisted to return to England, and through the kindness of two of the steamship companies the Society has been enabled to aid many to return who had nothing but want and suffering before them here."

They also say that this "applies more particularly to the great mass coming from your [English] manufacturing centres"; that the panic of last year, having paralyzed the manufacturing industry of the country, such men as these could not get any work. Farm-labor is out of the question for them, the "average English artisan" being "as helpless on American soil as he would be on an English farm." The Society declare that they are far from wishing to do anything to discourage "legitimate emigration"; indeed, they say "there is ample room for the whole of your population if they desired to come, and the country could have no better material; but 'there is a time for all things,' and the time to emigrate to America is not when all her industries are temporarily crippled by a panic so disastrous as that which began with the failure of Jay Cooke." The Society also warn intending emigrants of lying placards posted throughout England, announcing that 10,000 men are wanted to work on the Centennial building at Philadelphia at $5 a week, the whole thing being an absolute invention. At this port the arrivals have diminished by about fifty per cent. since the panic, and very naturally.

We are very sorry to have to add even one to the list of demagogues and mountebank agitators of the labor question here and in England; but it seems that Mr. Joseph Arch is, if not to be classed with the Odgers and Bradlaughs, very much more near them in feeling than he ought to be. Mr. Arch has been one of the leading promoters of the recent farm-laborers' lockout in England which has just come to such an unfortunate termination for the men, and the result, to say the least, shows that he induced them to embark in a very ruinous enterprise, in which the strength of the respective forces was much miscalculated. This might have been an error of judgment; but the leading agitators went far beyond advising the men to hold out against their employers. They assured them that the lock-out was only the beginning of a great revolution, which would end in the land being taken away from the owners and divided among the laborers, and these tales the simple-minded people listened to with great readiness. It seems hardly credible, but since the termination of the lock-out, and the discovery that there were no more funds in the Union treasury, and that the men must migrate, emigrate, or shift for themselves, the same kind of thing is still going on; a great meeting of locked-out men has recently been addressed by Mr. Arch, who assured them "that there was no such thing as a surplus of labor on the land," that "the land would bring double the produce into the market if more labor was employed upon it," that "the root of the evil lay in the monopoly of the land," and that it was high time all the uncultivated land should be seized, so that the state could "cultivate it for the people." And all this seems to have been a perfectly satisfactory solution of the question to the men who had been just turned out of their homes through having acted in accordance with this very advice.

The condition of Sicily is causing the Italian Government much uneasiness. The island is suffering from an outbreak of the form of brigandage called *malandrinaggio*, or that kind of lawlessness of which the railroad robbers in Missouri, and the gangs that formerly infested Central New York, furnish notorious examples. They plunder in the cities and in the fields, rescue any of their number who may be caught, or prevent their being brought to trial by intimidating judges and jurors. The evil has become so flagrant that the Government is urged to suspend trial by jury in the island; and it certainly appears better that the Government rather than the highwaymen themselves should suspend it. In a recent case at Palermo, where a pawnbroker's shop had been robbed, it was found impossible to go on with the trial, as a legal jury could not be obtained. Those on whom the lot fell preferred paying the fine for neglect to exposing themselves to the vengeance of the confederates of the accused. The crowd in the court-room, too, grew to be ominously large, and it was deemed prudent to search certain characters for concealed weapons. Sicily is seen to be too far behind the civilization of the best parts of the peninsula to make it possible for constitutional forms to maintain themselves there. The ignorance of the population is still, in spite of praiseworthy efforts on the part of the Government, very dense, and the influence of the priesthood as great as it is pernicious. Ecclesiastical marriages, which have no civil validity, prevail to a large extent, and the opposition to the secular administration of the kingdom shows but little sign of yielding to the advance in enlightenment and the material improvements in roads and railways. For these chronic causes of violence and sedition there is, of course, no remedy but time, patience, and education. The present disturbances call for summary measures and at least a temporary state of siege. Assassination has become alarmingly frequent in the cities.

A committee of which Dr. Döllinger is the head has appointed a convention or conference to be held at Bonn on the 14th of the present month. It will be composed of men belonging to different churches who desire "the grand future union of Christians," and who on the present occasion will examine together the formulas of faith of the early ages of the church, as well as the doctrines and institutions deemed essential in the Eastern and Western Churches prior to the separation. The object of the enquiry is not union, absorption, or fusion of the different churches, but the establishment of an ecclesiastical communion on the basis of "unity in things necessary," while preserving every peculiarity of each church not inconsistent with the substance of the ancient faith. One can hardly anticipate from such a movement any result worth the pains. There never has been, and it is safe to say that there never will be, outside of an infallible Pope, any practicable criterion for distinguishing what is particular from what is essential in church doctrine; and the historical essence, if it could be ascertained, would be about as useful in promoting Christian unity as the Sanskrit roots in furnishing a universal language for modern use. It appears, too, to be of small consequence whether common ground could be discovered on which Catholics like Dr. Döllinger, Father Hyacinthe, and his reverend brother the "little Mortara" might stand, so long as we have the scientific world not only fast settling down into Darwinism, but calmly giving ear to Tyndall's resolution of mind into matter, and matter into the only conceivable Creator of itself and of all phenomena.

A letter of Lieutenant Cameron's to Lord Derby on the East African slave-trade has been published, and is worth noting on account of the remedy which it proposes. The writer gives a minute description of the various phases of the trade between Lake Tanganyika and the sea, from which it appears that there is nobody among the inhabitants of that belt of country who does not engage in the business, either mainly or as an incident of warfare. There is even a band of runaway slaves, "who have their headquarters not very far from Ugogo," who subsist altogether by slave-trade and plunder. "With regard to its suppression," says Lieutenant Cameron, "it is and will continue an impossibility until communication with the civilized world is opened up." This could be done by means of a narrow-gauge railway constructed from Bagamoyo to Ujiji, which would encounter no engineering difficulties, and could be completed for $4,000,000. "The present traffic on this line would pay an interest of 5 per cent.," and the business would double or treble in a few years, owing to the multiplication of articles of export. In place of ivory and slaves alone, as now, natural products like cotton, India-rubber, palm-oil, rice, grain, coffee, spices, and hides would demand transportation. The English commissioners of the road should be stationed at Mbumi and Ujiji, with a small force of Indian soldiers, and enough European subordinates to repress the slave-trade and the petty wars which foster it. A few small vessels would also be needed at Ujiji for the police of the lake. Lieutenant Cameron even goes on to predict branch lines to the Victoria Nyanza and to Urori, and lines on the other side of Tanganyika. He will perhaps seem less of a visionary if he succeeds in proving the connection of the last-named lake with the Khedive's Nile.

CHICAGO AND THE INSURANCE COMPANIES.

THE politicians of Chicago have lately had laid before them an alternative which, to judge by the discussions now going on in that city, they seem to consider of a good deal of importance. This alternative is contained in an intimation from the insurance companies doing business in the city that unless certain material alterations are made in the municipal provisions for protection against fire, the companies will withdraw in about a month, cancel all their policies, and take no more risks. Their demands upon the authorities are, among other things, that the fire limits of Chicago shall be extended and the wooden buildings in them removed, that the supply of water shall be made sufficient for any emergency, and that an efficient fire department, entirely non-political, shall be created. It is unnecessary to state that the reason of this demand on the part of the insurance companies is the fact that Chicago, since the great fire of 1871, has taken no adequate means of preventing a recurrence of such a catastrophe, and the proof of this is to be found in the recent conflagration there, which destroyed several millions of property, and was only prevented by pure accident from going through the entire city, as the earlier one did. Under these circumstances, the insurance companies have naturally become timid. They maintain with considerable force that if the business of insurance is to be carried on at a profit, it is necessary that the insured property shall not in all cases be burned to the ground. What the city of Chicago will do about the matter seems not as yet decided. The politicians are divided, some of them favoring an immediate compliance with the companies' demands, others maintaining that these demands are only another instance of the arrogance of capital; that the best thing for the city would be to show, once for all, its independence; and that it is a matter of indifference to Chicago whether they go or not, for Chicago would "insure herself," if they all went. Exactly what is meant by Chicago "insuring herself" is not explained, and, indeed, as the city has been built up by Eastern capital, and the prevailing rate of interest on loans secured by real estate there is ten per cent., it seems unlikely that there is any large amount of capital lying idle which might be profitably employed in insurance of property regarded by Eastern capitalists as extra-hazardous. This view, indeed, is that held by the property-owners, who are strongly in favor of complying at once with the demands of the insurance companies.

The business of protection against fire throughout the United States has since the beginning of the Government been in the hands of a person who is fond of describing himself as the Practical Man. The book-worm, the closet-thinker, the pedant, and the critic have had little or nothing to do with it. What has been learnt in the United States about protection against fire has wholly come from experience of a rather bitter and dismal kind. Almost as soon as it was settled that "this should be a government of divided powers—co-ordinate, yet each independent in its own sphere," the system of volunteer fire departments was organized in all the large and growing towns. These volunteer fire departments —which consisted of "practical" but perfectly untrained men, called together on occasions of necessity and emergency—did very well so long as no very complicated difficulties arose. In thinly-peopled towns where the houses were low, far apart, and so almost protected by nature, this sort of fire militia was no doubt of great service, and did whatever was needed. But in the crowded cities, into which these towns presently began to change, the case was quite different. There the dense packing of the houses, the tremendous draughts furnished by the streets, and the complications introduced by modern improvements, such as elevators, in the houses and stores themselves, soon made protection against fire a complicated question, and one that needed, in order to be properly dealt with, a high degree of almost military organization, strict subordination, special training, and professional devotion. The volunteer firemen, therefore, became every year more and more useless, and every year they converted their excursions to fires into midnight orgies, frequently ending in faction fights; and the men, instead of becoming more and more devoted to their business, became more and more devoted to politics. As the fire companies became more and more useless, however, the belief in their virtues became among the Practical Men and politicians more and more profound, and about the time that experience had conclusively proved them utterly worthless, the Practical Man had convinced himself that they were one of the finest institutions of this or any country, and on public occasions he usually referred to them as a sort of bulwark of liberty like the trial by jury or habeas corpus. The legend about the institution even penetrated into foreign countries, as any one may satisfy himself by reading that amusing parody of American life, Laboulaye's 'Paris in America.'

By-and-by, however, the unpractical people who happened to live in the large cities discovered to their amazement and dismay, what might have been easily found out before by studying the history of protection against fire in other countries, that the "boys," instead of doing any good by running with the "machine," were making themselves a nuisance, and by their riotous, undisciplined behavior and lack of knowledge, and their frivolous way of treating the very grave charge they undertook, were a source to the cities they nominally protected of almost more danger than if they had no protection at all. The first step, therefore, in fire reform was the abolition of the volunteers and the creation of paid fire departments, utterly free from political interference, officered by responsible and trained men, and with the subordinates under a semi-military discipline, certain of promotion for good behavior, and of degradation for bad; and this step was made after much opposition and resistance from the Practical Men.

We believe we may say, without fear of contradiction, that the cities which since the volunteer period ended have been proved to be most secure from fire have been those in which this new régime has been most thoroughly and in good faith adopted. Any one who has looked into the subject at all knows that Portland, Boston, and Chicago had at the time of their great fires as bad fire systems as any in the country. New York, bad as most of its government undoubtedly has been, probably has had, till lately, the best. It cannot be questioned, either, that Chicago has had an opportunity within the last four years of discovering what its deficiencies were in these respects, and remedying them. But Chicago is one of the great headquarters in modern times of the Practical Man. There is, perhaps, no place of an equal population which contains so many men who have made their fortunes by a sharp look-out for the chances of a rise or fall in the market from day to day, without the slightest regard to ulterior conditions. The Practical Man who has settled in this great commercial centre is full of energy, full of perseverance, and always sanguine of success, and, in fact, has always been in the habit of laughing at any one who warned him of any danger to his future from any quarter. He was among the people, too, who were always confident that "what the politicians did" made no sort of difference, that if they did anything very mischievous the people would be sure to rise in their might and make them do right, and that, whatever might happen, it would "all come out right in the end."

It would appear that this plain, practical, common-sense way of looking at things the Chicagoans have applied to the question of protection against fire as well as to everything else; and, so far as can be made out, they have built up the city since the great conflagration of 1871 in very much the same condition in which the fire found it, and that their fire department is in much the same condition in which it would have been had they never heard of the fires in Boston or Portland. There has been no protection by means of open squares, and the department is as much in politics as it ever was, and because the department is in politics the city is partly composed of highly inflammable structures, put up and inhabited by the constituents of the men whose votes are necessary for their removal; and they have just had a second fire which has destroyed several more millions of property, and caused the insurance companies to threaten to cease doing business in the city.

It must be confessed that the Practical Man has, on the whole, made a bad record for himself with regard to protection against

fire. Within the past five years he has managed, by letting politics take care of themselves, to destroy as much property in the United States as would have been lost in a good-sized war. The critic, on the other hand, has had the best of the argument, and, unlike most prophets of evil, has had his predictions of disaster verified almost as they were uttered. We may say in conclusion, that we have no doubt that the Chicago authorities will now learn wisdom and accede to the demands of the insurance companies. It seems almost incredible that they should not. But it also seems almost incredible that they should have been so blind to the consequences of their own acts as they have been. The rest of the country has many interests centred at Chicago, which cannot be long submitted to a Fourth-of-July recklessness, established there as a principle of government. What with the railroads, that have built up Chicago, threatened on the one hand with robbery by the farmers, and the politicians of the city gravely discussing whether they will allow the property-holders to obtain insurance or not, we seem to have reached a point at which even the most Practical Man of them all must find time to ask himself whether he really is the finest product of civilization, or whether he is not capable, even in this most flourishing country and in this most flourishing age, of bringing disaster and ruin upon his foolish head by his extravagant and impudent conceit.

VILLAGE IMPROVEMENT.

THE discussion which always goes on in the newspapers during the summer as to the merits of the various places of retreat or amusement which the country affords the tired business man and his family, has this year brought to light some new facts about internal village economy in certain parts of the country which have attracted, as they deserved, a good deal of attention. It does not seem to have been generally known, to judge at least from the way the matter is referred to—as if it were a complete novelty—that now for a good many years in many of the villages in New England a vigorous attempt has been made by voluntary associations to render the villages in question attractive and pleasing to the eye, by the planting of trees and shrubs, the maintenance of orderly-looking and neat town-ways, and by infusing into the minds of the inhabitants a pride in the appearance and reputation of their town. How far the movement has extended it is difficult to tell, but there has been enough of this kind of æsthetic reform to attract much attention and serve as a good example. It is noticeable that this village-improvement ardor appears to have seized upon the minds of the rural innovators at about the same time that all the large cities in the United States began to consider the question of parks and of suburban improvement. There is no great difference, except the important one of magnitude, between the two schemes; it is not unfair to consider them together as a general indication of the rapid advance of the country in taste, and in that appreciation of the beautiful which has certainly been most sadly needed.

These village associations have one remarkable feature in common—that they are voluntary. In no case that we have seen has any attempt been made to use the town organization for the purpose of carrying out the objects of the society. If we were to make predictions on such a subject, we should undoubtedly look to see the improvements being made by the town organization itself, through the political machinery of which it is already in possession, and through which it has locally all necessary power. But we find, on the contrary, in all these cases that the voluntary associates have as little as possible to do with politics, and avoid as far as they can all connection with the regular machinery of town-meetings, assessors, and tax-collectors. The town, of course, in many cases carries on improvements of its own, renews bridges, subscribes for stock in railroads, or builds drains, but in all this they have no legal or substantial connection with the improvement reformers. So that, in those towns in which this beautification movement is in full force, we have two bodies at work, both directed theoretically to the same end—the benefit of the community; but one acting by the direction of the town itself, the other acting of its own motion, like a private corporation—an extra-legal town within a legal town. It would seem natural, perhaps, that one of these organizations should swallow up the other, but, as it is, they both go on side by side, one attending to the routine laid down for it in the statutes of the State, the other inventing and performing its own self-imposed duties as they from time to time suggest themselves.

If we look further into these villages, we shall find what is perhaps one explanation of this division of labor. Any one would naturally imagine, in communities so much interested in self-improvement, that the general political tone was high; that these were the old democratic communities of New England of which we have heard so much; that here at least town government had remained in a pure and sound state—the people really electing the best men to office, and controlling them with a vigorous public opinion. If, however, you make enquiries into the political condition of the village, you will be told that it is not by any means perfect, and, on pursuing your investigation further, you will very likely find that the people speak of the politicians of the place much as any one in New York would speak of Tweed or Sweeny; that they will assure you of the existence of a corrupt "ring," interested in jobs of all kinds, will point out some bridge or piece of canal that is well known to have been fraudulently enhanced in cost by the politicians who managed the contract; and will very likely end by giving you an amusing account of the device by which the town treasurer made use of his balances to build the neat-looking cottage which is attracting your attention on the other side of the way.

With the causes of the political decline in town life we have been made familiar by the discussions in the newspapers. We know very well how it is that, what with the emigration of large numbers of the young and able-bodied men to the West, the influx of the nomadic, ignorant foreign population has made the so-called "declining towns" of the older parts of the country the ideal home of the smaller and more disreputable politician, who by means of an ignorant laboring vote is able during ordinary times to keep control of the local machinery, and, by not committing any very outrageous or prominent crime, to feather his nest very comfortably. On the other hand, it is equally evident from such movements for local improvement as we hear of from time to time, if indeed we did not know it from other evidence, that there is a vast amount of energy, public spirit, and a genuine desire for a more pleasing and wholesome civilization than rural life commonly affords; and that, if it could only be set in motion, very important steps might be made in advance.

There is only one direction in which we can look for assistance, and fortunately it is the one from which assistance is apparently coming. What is wanted in the "declining towns" of the older parts of the country is the establishment of a class of responsible land-owners, fastened to the soil by interest and affection, and forced by their circumstances to take an active part in the local affairs. That there is a good deal of reason to believe in the appearance of such a class of people in the older parts of this country there can be little doubt. The steady creation of wealth, and the necessity of employing it, the overcrowding of professional life in the cities, and the natural attraction for a country life felt by all people of our race, make it not only possible but highly probable that year by year many of the small farms of the East will gradually be swallowed up in large farms, of one kind or another, and that the owners will in course of time acquire that sense of responsibility which long ownership and a complete identification of interest give. We may see this process now going on in New England. The change will have, among other good results, the effect of making the work of the individual reformer easier than it now is. It is not the influence of wealth and property in politics, but its illegitimate influence, that is to be deprecated. At present, in the cities, the system of municipal government in vogue takes away political weight from the man of wealth, position, and education. He is made to submit to and govern himself

by laws which he has no hand in making, and which are passed frequently as a bid for the vote of a part of the population whose interests are diametrically opposed to his. The consequence is that he is tempted to gain the ends fraudulently which he cannot secure by fair means. He is overtaxed, and despairing of any equal taxation he gets rid of his taxes by bribery, by having a friend in the board of assessors, by applying to corrupt courts to have assessments set aside, and so on; and in this way he in the end secures his object, but at what a cost! In the country, however, there is not generally this division of interest. In the country, the great foundation of all interest is the land: he who owns the most land is the best man—most respected, most feared, and most followed. Taxes are light because great public enterprises are unnecessary, and most of all because the taxes must in the country be voted by those who pay them. For this reason it is that in rural communities there is a real opportunity for men of means and education who desire the public good, to obtain lasting influence and power. At present, owing to the changing and unsettled character of the population, these local governments are corruptly used, but we believe reform will be made easier by the very change its elf.

A LESSON FOR SENTIMENTALISTS.

IT would be a pity if the public disgust with what has been going on over in Brooklyn, or public weariness of the pros and cons of the Tilton-Beecher case, should prevent some of its more obvious lessons from being laid to heart. The first thing which strikes one in the letters, "statements," "confessions," and other documents of the parties to the affair, is the extraordinary use made by them of the English language. In their hands, it seems almost to lose the character of an instrument for the expression of definite propositions—or, in other words, for the communication by one human being to another of formulated thought—and becomes a mere mode of indicating certain states of feeling, like the noises made by the lower animals. On reading their compositions, one has to guess at what they really mean, the only thing certain being that they are either happy or miserable, just as when a dog howls or barks we know that he is either glad or sorry or angry, but cannot well make out what he would like to have us do. They resemble the lower animals, too, very strikingly in the absence from their minds of all gradations of feeling, and of all reserve in their intercourse with each other. They seem to have no more power of pursuing a middle course, of making distinctions and allowances, of adapting their expression to circumstances, than our humble friends of the kennel and stable. They pass from the extreme of violent love and admiration to the fiercest hatred and malignity. Tilton, for instance, will one day call Bowen "a great and good man," and the next denounce him as the prince of evil, with no more bashfulness or sense of absurdity than a horse would have in kicking the mate he had just neighed for and run after. They embrace men whose acquaintance they have only just made as if they were friends of their youth, and call people by their Christian name almost at the first interview, so that you can infer nothing from their language as to the real length or nature of their relations with anybody. Mr. Beecher addresses Moulton, who was an avowed "heathen," and a Butlerite heathen to boot—and whom he *knew*, in the sense in which the word is ordinarily used, only very slightly—in terms of affection which leave him (Mr. Beecher) absolutely no means of describing his feelings towards a lifelong, trusted, and dearly loved associate belonging to his own church. The separation between religion and morality in the minds of many Sentimentalists, which often seems so shocking to outsiders, and of which this Brooklyn case furnishes so many examples, is often only apparent, and the appearance of it is due to their loose way of talking. Their extravagance of speech often leads people to infer that they hold opinions and cherish feelings which they really do not profess, and if questioned closely would not pretend to profess. They, therefore, often seem hypocrites when they really are not. Much of their religious phraseology, for instance, taken coldly and literally, ought to indicate an abiding sense of God's presence, which should keep them from the grosser forms of wrong-doing at least; but we see them use this phraseology one minute with great unction and tell barefaced lies the very next; and it in reality indicates merely a mushy, spasmodic, and for the most part feeble desire to be better men and women than they are. It is, in short, an expression of moods rather than of purposes, and they resort to it somewhat as an Italian takes up a violin, as a vent for feeling.

The most curious and illustrative phenomenon in their recent history has undoubtedly been the rise of Woodhull into prominence, and with some of them even into influence. This woman, before her appearance on the surface, had been the keeper of a disreputable house and a fortune-teller in Chicago; under ordinary circumstances, she would have been received in New York nowhere out of Greene Street; but when she came on here she found the Sentimentalists in a state of mind that made her rise into eminence among a portion of them easy and rapid, and finally enabled her to secure the services of a Sentimentalist editor as a biographer, and actually gave her, in the eyes of some of them, the position of a martyr, even though they did not share what they called her "opinions." It was in this character that she, we have been informed, came near getting an invitation to unpack her stock of "truths" before the Boston Radical Club. This state of mind was the direct result of a false analogy, a species of error which is constantly bringing Sentimentalism to grief. The imaginations of most of them were profoundly impressed by the anti-slavery agitation, especially by the contrast offered by its brilliant and dramatic close to its arduous and unpromising beginning. Now, the most striking thing in its history, as well as in the history of two other great movements—Christianity and the Reformation—was that doctrines which were first preached by a small body of reviled and persecuted men, and were held in detestation by what is called the respectable portion of society, finally convulsed the state, and triumphed over all opposition. The reasons of this success in all the three cases are, of course, to be found in the character of the doctrines and in the social and political conditions in which they made their appearance. The early insignificance of the Apostles, and the contempt and hostility with which they were at first received, are only secondary incidents, which account for nothing, explain nothing, and offer no materials for predicting the final results. The vast majority of strange doctrines preached by odious men have vanished from the world without leaving a trace on the surface of human affairs; and one needed neither great learning nor ability, nor anything but a stock of plain common-sense, to see that when a strumpet began to preach fornication as an instrument of social regeneration, the disgust of the public indicated, not that she might turn out to be a Luther or Savonarola or Garrison in disguise, but that she would probably and deservedly be put in jail for indecency. The Sentimentalists, however, had not as much common-sense as the occasion called for, and were rather startled by her appearance, and some of them began to ponder her dirty gospel with amazing seriousness. She took rank among the reformers, and made her way in this city into a not very savory locality, described by the reporters of the Brooklyn case by the term "inner suffrage circles," and actually got a nomination for the Presidency from the more crazy ones before her downfall.

For a while, all went on swimmingly. She used the proper reform phraseology, and seemed to be thoroughly in earnest, and was heartily persecuted by society. Hotels would not receive her; she could not hire a house; and no decent man would preside at her lectures. This, combined with the fact that she wanted to "emancipate" somebody, was opposed to "bonds," and was waging war against long-established usages, was all that was needed in a good many Sentimentalist eyes to entitle her to a respectful hearing. She ought not, they thought, to be "crushed" or "choked down." It was best that she should be allowed to utter what was in her. At this point another Sentimentalist illusion came to her aid—viz., that propositions which people do not want to listen to are probably "truths," and the more precious because "unpopular truths." Let any earnest body begin saying things which people find unpleasant, and his wares are at once put in the same category with Kepler's laws or Harvey's discovery, without any examination of their quality or composition. So Woodhull found herself for a while peddling goods which some people thought were "truths," and others thought might be "truths," and accordingly ought to be handled reverently. She was to be listened to, also, in the interest of liberty, which, according to many Sentimentalists, is a good in itself and not a means towards the attainment of good. Any sort of antics which show you are "free" are valuable, and ought not to be repressed.

The whole affair from first to last is a most impressive reminder of the value of reasonableness and sober-mindedness; of, in short, the necessity of cultivating, not the faculties we possess in common with the brutes, but those which differentiate us from the brutes. The family, the church, and the state are all best saved and defended, not by animal credulity, illogicality, impulsiveness, recklessness, but by human perception, discrimination, and forethought. The enthusiasm of the Puritans founded states, changed forms of government, and influenced the destiny of mankind, while the enthusiasm of an Irish clan usually produces nothing more lasting than a riot. The first duty of everybody is to cultivate habits of accurate speech and of sober discrimination, of honest respect for facts, and of reverence for the efforts heretofore made by the race to which he belongs towards right living.

IN BELGIUM.

OSTEND, August 14.

BELGIUM, in most itineraries, is visited conjointly with Holland. This is all very well so long as Belgium is visited first; and my advice to travellers who relish a method in their emotions is in this region to reverse the plan which is generally most judicious, and proceed in all confidence from south to north. Passing from the Low Countries into Flanders, you come back into the common world again—into a picturesque phase of it, certainly, and a country rich in architectural and artistic treasures. But you miss that something, individual and exquisite, which forms the charm of Holland, and of which, during the last forty-eight hours of my stay there (it seems a part of the delicacy of all things that one calculates one's stay in the little Dutch garden by hours), my impression became singularly deep. It has become deeper still in retrospect, as such things do, and there are moments when I feel as if in coming away I had wantonly turned my back upon the abode of tranquil happiness. I keep seeing a green canal with a screen of thin-stemmed trees on one side of it, and a foot-path, not at all sinuous, on the other. Beside the foot-path is a red-brick wall, superstitiously clean, and if you follow it a little while you come to a large iron gate flanked with high posts, with balls on top. Although the climate is damp, the ancient iron-work of the gate has not a particle of rust, and its hinges, as you turn it, are in perfect working order. Beyond it is a garden planted with tulips of a hundred kinds, and in the middle of the garden is a pond. Over the pond is stretched, from edge to edge, a sort of trellis of tense cord, which at first excites your surprise. In a moment, however, you perceive the propriety of the pond's being carefully guarded, for its contents are singularly precious. They consist of an immense number of gigantic water-lilies, sitting motionless among their emerald pads, and of a brilliancy and softness which makes you fancy they are modelled in wax; of a thousand little gold-fishes, of so deep a crimson that they look as if they were taken out every morning and neatly varnished over with a fine brush; and, lastly, of a majestic swan, of the purest porcelain. About the swan there is no doubt; he is of the finest Dutch delf—a substance which at a certain distance looks as well as flossy feathers, and has the advantage that a creature composed of it cannot circulate to the detriment of varnished fishes and waxen lilies. I do not know how this pond looks on paper, but in nature, if we may call it nature, it was delicious. There was a skyful of rolling gray clouds, with two or three little patches of blue, and over the tulip-beds there played a little cool breeze, with its edge just blurred by dampness. Under the trees was just one bench, but it was strictly sufficient.

I must not linger on Dutch benches, however, with all the art-wealth of Flanders awaiting me. I have by no means in fact examined it all, and have had to pay the tourist's usual tribute to reluctant omission. In such cases, if you are travelling *con amore*, the things omitted assume to the mind's eye a kind of mocking perfection, and the dozen successes of your journey seem a small compensation for this fatal failure. There is a certain little *hôtel de ville* at Louvain and a cathedral at Tournay which make a delicious figure in the excellent hand-book of M. Du Pays; but I hasten to declare that I have not seen them, and am well aware that my observations are by so much the less valuable. I first made acquaintance with Belgium, however, through the cathedral of Antwerp, and this is a first-rate introduction. I went into it of a Sunday morning during mass, and immediately perceived that I was in a sturdily Catholic country. The immense edifice was crowded with worshippers, and their manner was much more *receuilli*, as the phrase is, than that of the faithful in Italian churches. This too in spite of the fact that the great Rubenses were unveiled in honor of the day, so that all the world might behold them gratis. To be *receuilli* in the presence of a Rubens seems to me to indicate the real devotional temperament. The crowd, the Rubenses, the atmosphere, and the presence of some hundred or so of dear fellow-tourists was rather hostile to tranquil appreciation, so that at first I saw little in the cathedral of Antwerp to justify its great reputation. But I came back in the late afternoon, at that time which a wise man will always choose for visiting (finally at least) a great church—the half-hour before it closes. The Rubenses, those monstrous flowers of art, had folded their gorgeous petals; but this I did not regret, as I had been in the interval to the Museum, where there are a dozen more, and I had drifted to a conclusion. The church was empty, or filled only with the faded light and its own immense solemnity. It is very magnificent, not duskily nor mysteriously so, but with a vast, simple harmony which, like all great things, grows and grows as you observe it. Its length is extraordinary, and it has the peculiarity, unique in my observations, of possessing no less than six aisles, besides the nave. Its height is in harmony with these splendid proportions, and it gave me altogether (I do not know the literal measurements) an almost unequalled impression of vastness. Externally, its great tower, of the most florid and flamboyant, the most embroidered and perforated Gothic, is one of the few worthy rivals of the peerless steeple of Strassburg.

The Antwerp Museum is very handsomely housed, and has an air of opulence very striking after the meagre and dusky contrivances in this line of thrifty Holland. But there is logic in both cases. You bend your nose over a Gerard Dow and use a magnifying glass; whereas, the least that can be done by the protectors of Rubens's glory is to give you a room in which you can stand twenty yards from the canvas. I may say directly that even at twenty yards Rubens gave me less pleasure than I had hoped. I say hoped rather than expected, for I was already sufficiently familiar with him to have felt the tendency of my impressions, and yet I had fancied that in the atmosphere in which he wrought, in the city of which he is the *genius loci*, they might be diverted into the channel of sympathy. But they followed their own course, and I can express them only by saying that the painter does not please me. If Rubens does not *please* you, what is left?—for I find myself utterly unable to perceive in him a trace of that intellectual impressiveness claimed by some of his admirers. I read a while since a charming book in which an acute French critic, M. Emile Montégut, records his impressions of Belgium and Holland, and this work was partly responsible for my supposition that I should find more in the author of the "Descent from the Cross" collectively, at Antwerp, than I had found in him, individually, at London, Paris, and Florence. M. Montégut, I say, is acute, and the number of things his acuteness finds in Rubens it would take up all my space to recount. According to him, Rubens was not only one of the greatest of mere painters, but he was the greatest genius who ever *thought*, brush in hand. The answer to this seems simple: Rubens, to my sense, absolutely did *not* think. He not only did not think greatly, but he did not think at all. M. Montégut declares that he was a great dramatist superadded to a great painter, and calls upon the people of Antwerp to erect to him in the market-place a colossal monument (the one already standing there will do, it seems to me) and inscribe upon the pedestal his title to the glory of having carried his art beyond its traditional limits, and produced effects generally achieved only by the highest dramatic poetry. If the great painter of rosy brawn had had half his commentator's *finesse*, he would have been richly endowed. M. Montégut finds, among other things, unutterable meanings in the countenance of the Abyssinian king who is looking askance at the Virgin in the "Adoration" of the Antwerp Museum. I remembered them so well that, in leaving the cathedral, I hurried to commune with this masterpiece of expressiveness. I recommend him to the reader who may next pass that way. Let him tell me, from an unbiassed mind, how many supplementary emotions he finds reflected in the broad concupiscence of the monarch's black visage. I was disappointed; dramatists of the first order are rare, and here was one the less. If Rubens is anywhere dramatic, in the finer sense of the term, it is in his masterpiece, the "Descent from the Cross," of the cathedral; of all his pictures, this one comes the nearest to being impressive. It is superbly painted, and on the whole very noble; but it is only a happier specimen of the artist's habitual manner—painting by improvisation, not by reflection. Besides the Rubenses at Antwerp, I have seen several others. Those at Brussels, unfortunately, with most of their companions of the Flemish school, have been now some two years invisible. They are being restored; but one is curious to see the effect of two years' refreshment upon the native robustness of most Rubenses. I need not speak of these various productions in detail; some are better, some are worse, all are powerful, and all, on the whole, are irritating. They all tell the same story—that the artist had in a magnificent degree the painter's temperament, without having in anything like a proportionate degree the painter's mind. When one, therefore, says that he was perfectly superficial, one indicates a more fatal fault than in applying the same term to many a more delicate genius. What makes Rubens irritating is the fact that he always *might* have been more interesting. Half the conditions are there—vigor, facility, color, the prodigious impulse of genius. Nature has given them all, and he holds the other half in his own hands. But just when the others should appear and give the picture that stamp which draws from us, over and above our relish of the natural gift, a certain fine sympathy with the direction it takes, Rubens uncloses his careless grasp, and drops them utterly out of sight. He never approaches something really fine but to miss it; he never attempts a really interesting effect but to vulgarize it. Our deepest interest, as to an artist, depends on the way he deliberates and chooses. Everything up to that point may be superb, but we care for him with a certain affection only when we feel him responsibly selecting among a number of possibilities. This sensible, intellectual pulsation often gives a charm to the works of painters to whom nature has been anything but liberal, and the great limitation of Rubens is that in him one never perceives it. He takes what comes, and if it happens to be really pictorial, he has a singular faculty of suggesting that there is no merit in his having taken it. He never waits to choose; he never pauses to deliberate; and one may say, vulgarly, he throws away his oranges when he has given them but a single squeeze. The foolish fellow does not know how sweet they are! One ends, in a man-

ner, by disliking his real gifts. A little less facility, we call out, a shade or so less color, a figure or so the fewer traced in, a bosom or two less glowingly touched; only something once in a while to arrest us, with the thought that it has arrested you!

Almost as noteworthy as anything else in the Antwerp Museum is the title of a picture by Titian, of average Titianesque merit. It is worth transcribing for its bizarre conflict of suggestions: "John, Bastard of Sforza, Lord of Pesaro, husband, by her first marriage, of Lucretia Borgia, and then Bishop of Paphos and Admiral of the Pontifical Galleys, is presented to St. Peter by the Pope Alexander VI." Add to this that St. Peter is seated upon a fragment of antique sculpture, surrounded by a frieze representing a pagan sacrifice! Even that harshly sincere genius, Quentin Matsys, who shines hard by in a brilliantly pure piece of coloring, can hardly persuade us that we are in simple Flanders, and not in complex Italy.

It often happens in travelling that places turn out to be less curious than we had supposed, but it is a comparatively rare fortune to find them more so. And yet this was my luck with Brussels, a city of which my imagination had made so light that it hung by a hair whether I should go there or not. It is generally spoken of by its admirers as a miniature Paris, and I always viewed it with that contempt with which a properly-regulated mind regards those shabby, pirated editions of the successful French books of the day which are put forth in Belgium. These ill-conditioned little volumes are miniature Victor Hugos and Michelets. But Brussels should ask to be delivered from its friends. It is not a miniature anything, but a very solid and extensive old city, with a physiognomy and character quite its own. It is very much less elegant than the Paris of the last twenty years; but it is decidedly more picturesque. Paris has nothing to compare for quaintness of interest with the Brussels Hôtel de Ville, and the queer old carved and many-windowed houses which surround the square. The Hôtel de Ville is magnificent, and its beautiful Gothic belfry gives, in quite another line, an equal companion in one's memory to the soaring campanile of the palace of the Signory at Florence. Few cities have a cathedral in so impressive a position as St. Gudule—on a steep hill-top, with a long flight of steps at the base of its towers; and few cities, either, have so charming a public garden as the Parc. There is something peculiarly picturesque in that high-in-the-air look of the Parc as you glance from end to end of its long alleys, and see the sky beneath the arch of the immense trees meeting the bend of the path. All this part of Brussels, and the wide, windy Place Royale, handsome as the handsome was understood fifty years ago, has an extreme brightness and gaiety of aspect which is yet quite distinct from the made-to-order brilliancy of the finest parts of renovated Paris. The Brussels Museum of pictures is admirably arranged; but, unfortunately, as I have said, only half of it is now accessible. This, however, contains some gems of the Dutch school—among them a picture by Steen, representing a lad coming into a room to present a fish to a ruddy virago who sits leering at him. The young man, for reasons best known to himself, is sticking out his tongue, and these reasons, according to M. Montégut, are so numerous and so recondite that I should like the downright old caricaturist himself to have heard a few of them. I wonder where *his* tongue would have gone.

Ghent I found to be an enormous, empty city, with an old Flemish gable-end peeping here and there from its rows of dull, white houses, and various tall and battered old church-towers looking down over deserted sunny squares. In the very middle of all this, in the stately church of St. Bavon, is the great local treasure, the "Adoration of the Lamb," by the brothers Van Eyck. This is not only one of the pictures of Ghent, but one of the pictures of the world. It represents a large daisied meadow shut in with a great flaming tangle of hedges, out of which emerge various saints of either sex, carrying crowns and palms. In front are two other groups of apostles and prophets, all kneeling and worshipping. In the middle is an altar, surmounted with the fleecy symbol of the Word, and surrounded with a ring of adoring angels. Behind is a high horizon of blue mountains, and the silhouettes of three separate fantastic cities, all apparently composed of church-towers. The picture is too perfect for praise; the coloring seems not only not to have lost but actually to have been intensified and purified by time. One may say the same of the precious Memlings at Bruges—and this is all I may say of that drowsy little city of grassy streets, and colossal belfries, and sluggish canals, and picturesque memories.

Correspondence.

THE LYING IN THE "SCANDAL."

To the Editor of the Nation:

Sir: It is not often that your paper lacks perspicuity, but your article on "Moulton's Story" I cannot understand fully. Last week, reviewing Mr. Beecher's Statement, you said not guilty; this week, reviewing "Moulton's Story," you say "it adds nothing to the testimony against Beecher, nor anything which Beecher's Statement does not seem sufficient to explain except Moulton's assertion, etc." Closing, you say "the lying in *every* direction seems, etc.," and "it has come to be a conflict of veracity between people whose moral standard is not that of respectable men."

As, according to your own showing, it is now either "Moulton's assertion" or "Beecher's assertion," do we understand you give up faith in Mr. Beecher, and include him among those whose "moral standard, etc."; and, as the lying is tremendous in *every direction*, you also believe Beecher lies? I cannot understand what you mean, and would like to.

With respect, J. A. Walker.

August 27, 1874.

[Our phrase was certainly loose and careless, but was born of increasing disgust. We did not intend to include Mr. Beecher among the "liars." The charge of "unblushing and tremendous lying" we only intended to bring against those actors in the affair who are liars *on their own showing*, and in this category we place Tilton and his wife, Moulton, and "Bessie." Mr. Beecher may, humanly speaking, as they say in Brooklyn, have been guilty of falsehood, but it does not appear on the surface. He has not contradicted himself, or told two different tales about the same transaction. If he has told a lie, it is about the central fact of the case, and on this point there is nothing against him, thus far, except Moulton's and Tilton's assertions, they having, judiciously or injudiciously, destroyed Mrs. Tilton's "confession." At the same time, in a conflict of veracity between Beecher and Moulton, we are prevented from ruling Moulton out and accepting Beecher's assertions as final on points on which Moulton has not shaken his own credibility, by the fact that, so late as July 13, Beecher maintained his confidence in him and expressed it.—Ed. Nation.]

THE CHENEY DECISION.

To the Editor of the Nation:

Sir: Two points of more than general interest were decided by Judge Williams in the recent litigation in the Circuit Court of Cook County, involving the status of Rev. Dr. Cheney.

The first of these was as to the extent to which civil courts will go in examining into ecclesiastical proceedings; the second, as to the powers inherent in the office of a Bishop of the Protestant Episcopal Church in the United States.

Rev. Mr. Cheney was put upon his trial for the alleged offence of leaving a word out of the prescribed office for the administration of Infant Baptism, in July, 1869, before an ecclesiastical tribunal of five of his brother clergymen, selected by himself, or the Standing Committee for him, out of a list of eight furnished by the Bishop of Illinois, in accordance with the provisions in that regard of the Diocesan Canon.

An injunction against further proceedings was granted by the Superior Court of Chicago upon grounds not now necessary to be adverted to, and the trial suspended until January, 1871, when the injunction was dissolved, and Mr. Cheney's bill dismissed by the Supreme Court of Illinois. In the meantime, one of the five presbyters constituting the ecclesiastical court had been consecrated Bishop of Arkansas, and was disqualified from sitting. When, therefore, in February, the trial was resumed, but four members of the former tribunal assembled. The accused, through his counsel, protested that the court as such had ceased to exist, and that the four gentlemen had no power to try in the premises—in other words, had no jurisdiction. The trial, nevertheless, was proceeded with, and resulted in a finding of guilt and a sentence of suspension, which sentence having been pronounced and disregarded, Mr. Cheney was again impleaded for such violation of the sentence, and, being tried and found guilty, was sentenced to deposition. The case just decided was a bill in equity to enjoin the wardens and vestry of Mr. Cheney's parish from employing and paying him, the gravamen of the bill being the alleged deposition. The legality of both the sentences was therefore in issue.

Had the civil court the right to investigate and determine the question of the validity of the sentences?

The language of the opinion pronounced by the Supreme Court of the United States, in the celebrated case of Watson *v.* Jones (13th

Wallace) justified the complainant's counsel in contending that the decision of an ecclesiastical court as to *its own jurisdiction* was as conclusive upon the civil courts as its decision upon any other matter in controversy before it, and this position was further fortified by the opinion of the Supreme Court of Illinois in Chase *v.* Cheney, in which it was stated: "It is conceded that where jurisdiction attaches, the judgment of the church court is conclusive as to purely ecclesiastical offences. It should be *equally conclusive* upon doubtful and technical questions involving a criticism of the canons, *even though* they might comprise jurisdictional facts."

This proposition was criticised by the *Nation* (Jan.-Feb. 1871) as inaccurate at the time the opinion was published. Judge Williams, however, held that the sentences of church courts were entitled to no higher authority than those of other courts, and that their jurisdiction as to the person and the subject-matter must necessarily be open to scrutiny; that in the case before him the question of jurisdiction was simply a naked question of power, a question of *its existence* uncomplicated with any enquiry as to *its exercise;* and that, "to establish the doctrine that church courts shall, *in all cases*, be the sole judges of their jurisdiction, would not only be to give them precedence in this regard over all civil courts, but to yield them powers dangerous in the extreme to civil liberty."

The conclusion reached, though apparently obvious enough, and sustained by a long line of authority in England and Scotland, has, nevertheless, been considerably obscured in this country by the loose language used by learned judges in the delivery of opinions in this class of cases.

The second noticeable ruling by Judge Williams relates to the inherent powers of a Bishop of the Protestant Episcopal Church, and arose in this way. Conceding for the sake of the argument that Mr. Cheney had never had a canonical or any trial, it was contended that the sentence of his bishop was nevertheless practically conclusive upon him—practically conclusive because, although such sentence might be voidable, there was no church judicatory or authority by which it could be set aside. This position rested upon the proposition that by the ecclesiastical common law the power of discipline to the extent even of deposition inhered in the office of a bishop, that such power was neither conferred nor could be taken away by the church, and that hence, deposition without trial, even though the latter were prescribed by the constitution and canons, would present the case of a defective exercise of power, and not the want of it, and would, therefore, be voidable and not absolutely void. Upon this branch of the case a large amount of evidence was taken, embracing the depositions of Judge Hoffman, Bishops Whitehouse, Odenheimer, Vail, Whittle, Kip, Cummins, Drs. Goodwin, Fulton, Seymour, Tyng, Nicholson, Chase, Locke, and others.

Judge Williams held that it seemed to be the universally accepted doctrine of the Protestant Episcopal Church in America that a power of government and discipline inheres in the office of a bishop, but that, as the law of that church now existed, the power in question was not held to be arbitrary and absolute. Assuming that, in the time of Cyprian, bishops claimed and exercised the power of condemning and sentencing offenders of their own volition and without the intervention of ecclesiastical judicatories, yet such could scarcely be considered the law of a church in this country, because so hostile to the genius, object, and spirit of the institutions of a free government. If the Protestant Episcopal Church had asserted the infallibility of its bishops, that would be a strong fact in favor of the existence of precisely the same church polity in the nineteenth as in the third century, but it had never done so. The experience of the church has been not dissimilar to that of the state. The assumption and usurpation of power on the one hand has been denied and resisted on the other, and the result of the conflict has been the gradual extinction of absolutism and the slow uprising of limited and constitutional governments; and where changes in church polity are not forbidden by the ecclesiastical law, then the church regimen has universally conformed in some degree to the civil government. The Protestant Episcopal Church in the United States is a church of law and not of will, and whatever the powers of a bishop in ancient times, they were undoubtedly abridged by the constitution and canons. These canons furnish the stipulations between the parties, and constitute the law for the conduct of the trial. "To hold that, in such a case, the bishop could suspend and depose a clergyman without a trial, would be to overthrow the whole theory of the civil courts in this country in reference to church discipline and government as the same has been developed and settled by a long series of adjudications. It would be substituting the uncontrolled will of the bishop in the place of the solemn agreement of the parties and the limited supervision of the courts of law."

It will be perceived that the decision upon this point is of the profoundest interest to the clergy of the Episcopal Church, and it certainly seems to admit of but little doubt that (as decided in England in Long *v.* Bishop of Cape Town) the oath of canonical obedience does not mean that the presbyter will obey all the commands of his bishop, but only those which the bishop is by the pact between the parties authorized to impose. It is due to the memory of the lamented Bishop Whitehouse to say that that eminent prelate did not for a moment assert that it would be right for a bishop to proceed in any case contrary to the canons. His contention was that, simply as a matter of ecclesiastical law, an uncanonical sentence was voidable and not void, and was therefore practically absolute because irreversible.

MELVILLE W. FULLER.

COOLBAUGH'S, MONROE CO., PA., Aug. 24, 1874.

Notes.

THE entire remaining stock of the late Professor Agassiz's publications, "all printed at the author's private expense, and at great sacrifice, during his sojourn at Neuchâtel as Professor of Natural History," has been purchased of his family, and is now offered for sale by Bernard Quaritch, 15 Piccadilly, London. The titles and prices of these works will be found in Mr. Quaritch's 'Rough List, No. 21.'——The fall announcements of J. R. Osgood & Co. embrace a noticeably large proportion of native American productions, though in no case is expectation greatly aroused by them. Poetry by J. T. Trowbridge, by Whittier ('Hazel Blossoms'), Holmes ('Songs of Many Seasons'), Aldrich ('Cloth of Gold'), Bayard Taylor ('The Prophet'—a tragedy), and Lucy Larcom ('Childhood Songs'); essays by Emerson ('Poetry and Criticism'), Lowell, and Prof. T. Sterry Hunt ('Chemical and Geological Essays'); tales by Howells ('A Foregone Conclusion'), H. H. Boyesen ('Gunnar'), and Julian Hawthorne ('Idolatry'); a new volume on the education of girls, by Dr. E. H. Clarke; a companion volume, by Wilson Flagg, to his 'Woods and Byways of New England'; 'Ten Days in Spain,' by Kate Field—are all works whose measure we can pretty accurately take in advance. The same may perhaps be said of Mr. John Fiske's 'Outlines of Cosmic Philosophy.' Under the head of art and architecture we find the following works, new and old, but for the most part of approved merit: from the French of Viollet-le-Duc, 'The Story of a House,' translated by Geo. M. Towle, and 'Discourses on Architecture,' translated by Henry Van Brunt, both illustrated; 'Homes, and How to Make them,' by E. C. Gardner, illustrated by the author; 'Art in the House,' from the German of Jacob Falke, by Harriet W. Preston, edited by C. C. Perkins, and illustrated with heliotypes. Also, a quarto illustrated volume, 'Famous Painters and Paintings,' by Mrs. J. H. Shedd; a new and enlarged edition of Spooner's 'Dictionary of Painters and Engravers,' in two volumes; and 'The Antiquity of Engraving, and the Utility and Pleasure of Prints,' by W. S. Baker, with heliotype illustrations.——The Boston Public Library has, by annexation of suburban libraries erected into branches, and by the usual means of purchases and donations, been increased by nearly 25 per cent. during the past year. The total number of volumes is now 260,550. No less than 103 persons are employed in the library and its branches. The new Chicago Public Library reports about 26,000 volumes, of which 21,000 are adapted for circulation. In the sixteenth week after opening (on the 1st of May) the average daily circulation had reached the surprising figure of 1,118 volumes, or one in twenty of the entire collection; a striking evidence of the deprivation caused by the great fire.——The Centennial Commission desire early applications for space from American exhibitors, in order to be able to make the proper assignment to foreign nations. Early provision should also be made for the organization of such collective exhibitions of the natural resources and raw materials of different sections of the country as cannot be made by individual exhibitors. "The importance of this, as an incentive to immigration and to the investment of foreign capital, cannot be overestimated."——The *American Garden*, a monthly illustrated journal, devoted to garden art, published by Beach & Son, Brooklyn, now commences its third year and a new series, with James Hogg as editor. It ought to be excellent, and the opening number (for September) is so. The publishers' preface does not overstate the worth and the services of the late Thomas Hogg, who was almost the father of horticulture in this city, nor of his two sons. Let us note in passing that, in correcting the account of another journalist respecting the Jerusalem artichoke, the editor perhaps lays himself open to correction. It is very doubtful if it was "introduced into England from Canada in 1617, having been previously brought there from Brazil." It is pretty certain that it does not belong to Brazil, and most probable that it went to Europe from Louisiana.——The London *Academy* (July 18) devotes nearly half a column of its Notes of Travel to an account of a remarkable magnetic cave discovered in California. It copies without misgiving the statement that a hatchet, carried by one of the

exploring party, was "wrested from him by a magnetic rock near which he passed, and the combined strength of four of the party was insufficient to detach it"; that "a pocket-knife, accidentally dropped to the floor, had to remain there, none of the party having sufficient strength to pick it up"; and, finally, that one of the explorers had to be lifted out of his nail-studded miner's boots, which were left immovably fixed to the magnetic floor of this cavern.——Number 251 of *Nature*, which Macmillan & Co. will have for sale on Saturday next, will contain a full report of Professor Tyndall's Presidential Address before the British Association at Belfast. With the same number of *Nature* will be given a portrait of Professor Tyndall, engraved on steel by Jeens, with a notice by Professor Helmholtz, forming the fourth of the series of illustrated articles on "Scientific Worthies" which is appearing in this periodical.

—We find in the California *Mail-Bag* for August a sketch of the career of James Lick, whose extraordinary disposition of his immense property in founding an asylum, an observatory, an art school, free baths, etc., etc., is well known to our readers. It appears that he was born Aug. 25, 1796, at Fredericksburg, Lebanon Co., Penn., being of German descent through his paternal grandfather. His first occupation was in an organ factory at Hanover in his native State; afterwards he obtained employment with a piano manufacturer in Baltimore. Shortly after the independence of the South American republics was declared he embarked for Buenos Ayres, and for a number of years in that country, in Chili, and in Peru he carried on the manufacture and the sale of pianos chiefly, acquiring a tolerable capital. With this, in 1847, he landed in California, where his real-estate investments in San Francisco soon made him wealthy, and ended in making him a millionaire. A better education than it was possible for him to obtain in his boyhood would probably have modified the character of some of his endowments, but as it might also have made him more selfish and less public-spirited, perhaps it is as well not to deplore the roughness of our diamond. Mr. Lick's conveyance is printed in full in the *Mail-Bag*, together with photographic likenesses of himself and his seven trustees (including the present mayor of the city and two ex-mayors), and of Leland Stanford, President of the Central Pacific Railroad.

—It is not often that a conviction for theft is followed by a spontaneous expression of sympathy with the thief on the part of property-owners; yet such seems to have been the result of the conviction of the unfortunate Mr. Weightman, an English barrister, who was sentenced some time ago to six months' hard labor for stealing books from the library of the Inner Temple. Mr. Weightman has been disbarred by the benchers of his inn, too, though they remarked "that it was a matter of great pain to them to have to do what duty had rendered imperative, but, while they regretted the circumstances compelling them to the decision at which they had arrived, yet they could not, after the commission of a crime so derogatory to the honor of the profession, relax their severity, but must do that which would protect and uphold the dignity of the bar"; and on being released from prison a check was handed to him, being the result of a public subscription of £600. The explanation of this sympathy is not to be found in the fact that Mr. Weightman had been engaged in the political arena and so needed a vindication, but that he had been actually compelled to steal books to save himself from starvation, and, according to rumor, he had, out of the proceeds derived from the sale of one book, applied a portion to the sustenance of a brother barrister since dead, who, like himself, was at the time of the theft starving and dying. These revelations of destitution in the profession have led to the institution of a fund for the relief of poor barristers in London.

—A libel suit brought in England by Mr. John R. Herbert, R.A., against the proprietor of the *Westminster Gazette*, has brought to light a form of libellous attacks which exhibits in the inventor considerable ingenuity. It consists of a series of questions addressed to the person whom it is intended to bring into public ridicule and contempt, the answers to which are rather implied than stated, and which are indeed expected to be suggested to the unhappy victim by the remorse of his own guilty conscience. For example, the first question which the Royal Academician was requested to answer by Mr. E. Welby Pugin, who seems to have been the original libeller, was: "Did I not try to cajole Pugin out of a house worth £4,000 for £2,000? did I not, in conjunction with others, act as though he dare not strike a blow in his defence? did I not, under the impression that he was penniless, exclaim, 'Now I have drawn my sword it shall not be sheathed until it is covered with glory or gore?'" and second, "Did I not resort to every dirty and filthy trick to avoid paying my just liabilities?" third, "Have I not loved my 'louis' more than my honor?" fourth, "Am I not a cur of the worst breed to have shirked opening my own letters, and to have requested my wife to keep them from my sight?" fifth, "Am I not a coward of the most contemptible nature to have made such a request, and then to have gone howling about the country, 'I did not mind so long as his letters were addressed to myself, that I could endure; but to have placed them in the hands of one's wife exceeds the bounds of endurance?'" sixth. "Am I not a dog, too contemptible to be worth kicking, for having apologized to Edward Barry for having written what I believed to be true?" seventh, "Have I not justly incurred the wretchedness I am suffering? Shall I not be a man utterly ruined both in reputation and purse?" eighth, "Will not the evidence that will be admitted at the trial make me wish I had never been born?" ninth, "Can I deny that I am a perjurer?" tenth, "Can I deny that I am a slanderer?" eleventh, "Can I deny that such conduct as I have been guilty of makes me, even in my own estimation, more stinking than the dunghills, more foul than the cesspools, to which Pugin has referred?" twelfth, "Have I gained anything by dragging an influential friend and kind patron into the vortex where my folly and rascality has (sic) driven me?" thirteenth, "Have I not, after the habit of the monkey, sought for cat's-paws to do my dirty work?" fourteenth, "Have I not conspired to effect this man's ruin?" fifteenth, "Have I got a hope on earth left?" sixteenth, "Can I expect mercy hereafter?" and in conclusion, Mr. Pugin comprehensively asks, "Now, sir, if you have courage to read this, the above examination of your conscience, is there an interrogatory that you can answer in the negative with any satisfactory result? I will now leave you to your reflections, and I do not envy you, but remain, E. Welby Pugin." Should this lively gentleman's publisher come well out of the suit brought against him, we may expect the catechistic form of libel to become very popular, as it manifestly suits the needs of a large and worthy class in every community.

—A writer in *Nature*, August 6, publishes part of a letter addressed him by M. Houzeau, author of a work in which the mental faculties of animals are compared with those of man. M. Houzeau is a resident of Jamaica, and has for a year past been studying the comparative development of intelligence in children belonging to different races. For two hours daily he taught fifteen pupils from neighboring families, and carefully watched their proceedings and rate of improvement under a common instruction. His conclusions, which are not to be regarded as final, but provisional, are, in brief, that "the rate of improvement is due almost entirely to the relative elevation of the parental circle in which children live—the home influence." In the unequal progress exhibited he finds nothing that can clearly and unmistakably be referred to the differences of race; and even the "personal coefficient" of each child—the degree of intellectual proficiency peculiar to itself—has less to do with the differences observed than he had anticipated. "Those whose parents are restricted to the narrowest gauge of intellectual exercise, live in such a material and coarse *milieu* that their mental faculties remain slumbering and gradually become atrophied; while those who hear at home of many things, and are brought up to intellectual life, show a corresponding proficiency in their learning." M. Houzeau's views derive a weight to which so limited an experiment would not entitle them, not only from the studies already mentioned as the basis of a former work, but from his having had some rare opportunities of studying "inferior races," including American Indians and half-breed Indians of the mixed race of Mexico. "I believe," he says, "that most of the savans of Europe have but a very incomplete idea of the mental, and still more the moral, status of 'inferior societies.'" His main conclusion is certainly a very strengthening one, and it is likely that the influence of the *milieu* has been as much underestimated as he perhaps overestimates it. His correspondent, Mr. W. Lauder Lindsay, reminds him of the "impossibility of duly estimating the direction or amount of future or adult mental development by the study of mental phenomena in the young." Familiar examples of this are the frequently superior quickness of girls over boys in acquiring knowledge up to a certain age; and the superiority in mental endowments, at certain stages of development, of the young of animals over the human child.

—One of the losses caused by the burning of the library of the Louvre under the Commune was a unique manuscript, entitled "Glorieuses marques du militaire français.' It was prepared in 1809 by Jean-François-Louis d'Hozier, herald-at-arms, and undertook to record the name and regiment of French officers of every grade killed or wounded from the time of the Crusades down to and including the reign of Louis XVI., and the engagement in which each suffered. By great good fortune, M. Louis Paris had as early as 1861 begun publishing this record in his magazine, *Le Cabinet historique*, and had made a complete copy of the original. This he is now reproducing in four volumes 8vo, with a supplement, in which the same service is rendered the killed and wounded of the French marine. A work which in some sort is a companion to the foregoing (of which the new title, by the way, is 'L'Impôt de Sang, ou la noblesse française sur les champs de bataille') is General Susane's 'History of the French Cavalry,' which gives the genea-

logy of the regiments from their formation down to 1815, and the chronology of each one.

—A society has lately been formed in Paris for the publication of texts relating to the history and geography of the Latin Orient, comprising in this term the kingdoms of Jerusalem, Cyprus, and Armenia, the principalities of Antioch and Achaia, and the Latin Empire of Constantinople. These texts are such as are, by reason of their secondary value, neglected by the Academy of Inscriptions and Belles-Lettres in publishing their 'Collection of Historians of the Crusades.' Pilgrimages to the Holy Land, for instance, will receive the especial attention of the new society. Its publications will be at the rate of two volumes annually, and will be in three series—historic, geographical (illustrated with maps), and poetic. The texts will be Latin; Greek, Hebrew, Slavic, Scandinavian, accompanied by a Latin version; French, Italian, Spanish, German, and English; and will be mostly printed for the first time. There will also be a limited number of phototypographic facsimiles of rare pieces. The profits accruing from sales and subscriptions will be capitalized until such time as they will permit the publication of two folio volumes of the cartography of the Latin Orient in the Middle Ages, and its numismatics, sigillography, and epigraphy. The society will admit three hundred and fifty associate subscribers, who, on the annual payment of fifteen francs, will be entitled to the book publications of the year. Applications should be addressed to Monsieur le Gérant de la Société Bibliographique, 75, rue du Bac, Paris.

—The French Minister of the Interior, General Chabaud-Latour, and his under-secretary, M. Cornélis de Witt, both happen to be Protestants. This circumstance, which displeases the Bonapartists, is not a source of unmixed gratification to the shorn remnant of the minister's coreligionaries—some 700,000 to 800,000, exclusive of the Alsatian Protestants. The Orthodox party menaces the Liberals with ministerial interference in favor of the Synod to which the latter so strenuously object; the Liberals can only say that General Chabaud-Latour is too high-minded a man to act as judge in questions in which he has a personal interest as a member of the Synod and of the Paris Consistory. A literary event in which both parties should take some satisfaction is announced in the *Renaissance* of July 18. This is the approaching publication of a new translation of the Bible by Professor Reuss, of the old faculty of Strassburg—a French scholar, so say his publishers, who was prior to 1870 an object of envy to Germany, and whom, after that date, she fondly counted upon as part of the booty of the conquered territory. His option, however, was for France, and so was that of MM. Sandoz and Fischbacher, who issue his prospectus. The work is not a small one. Besides the translation, it includes an introduction to each book, explanatory notes on the Old Testament, and a complete commentary on the New, making 12 to 15 volumes, or 7,000 pages octavo.

—The historian of Austria since 1848, Baron von Helfert, has recently issued a pamphlet—'Die Böhmische Frage in ihrer jüngsten Phase'—advising his countrymen of Bohemia to lay aside their passive policy of abstinence from imperial affairs, and to carry on their contest against the Austrian Government within the Government itself. The author professes the fullest sympathy with the objects of the anti-administration party in Bohemia, the maintenance of Bohemian nationality and the same degree of independence for Bohemia which is enjoyed by Hungary; he thinks, however, that the time has come when these objects can be best attained by a change of policy. The most interesting, or at least most novel, portion of the pamphlet is that in which he sketches the earlier constitutional struggles in Bohemia; from 1845 on, that is. Everybody knows something of the noble struggle of Hungary against Austrian despotism; it is not generally known, however, that Bohemia was likewise the seat of a vigorous and able constitutional resistance, which, like so many other promising movements, was brought to nought by the spasmodic revolution of 1848; but even after this there was a renewal and succession of similar efforts down to the present time. The history of these constitutional struggles is narrated by Baron von Helfert in a clear and interesting style and with the illustration of abundant documents.

DEMOCRATIC ILLUSIONS.*

MR. MORRIS'S sketch makes no pretensions to original research. It is a clear statement of the results of modern enquiry into the history of the great Revolution. But, though a book which cannot from its nature lay claim to originality, it is a very valuable and instructive essay. Mr. Morris (except in his far too favorable view of the influence of the Roman Catholic religion and the Roman Catholic hierarchy) has carefully followed the best and soundest modern authorities. He has the rare good sense to keep his head clear in treating of events which have generally seemed to affect injuriously the judgment of those who attemped to narrate them, and has kept in mind throughout his sketch the sound but constantly forgotten principle, that revolutionary crises must be examined and judged of, like all other periods, by the rules of ordinary common-sense and ordinary morality, and must not be looked at as times of miracle, when human nature puts forth unheard-of powers, and is freed from subjection to ordinary ethical rules. The belief, expressed in a thousand different forms, that revolutionary movements, because they display human nature in unaccustomed forms, and divested of some of the restraints of custom, have a virtually supernatural character, is the source of half the delusions which pervert modern views of the events which make up the history of France from 1789 to 1815. These transactions are wonderful enough in themselves, but imagination and sentiment have turned wonders into miracles, and have given birth to a whole host of democratic illusions and revolutionary legends. False theories have produced misconceptions of fact, and misconceptions of history have in their turn been made the basis of erroneous theories. Gradually a whole mass of errors has grown up which obscures our views of the past, misguides our judgment of the present, and leads to mistaken anticipations of the future. It is of course impossible, in a mere essay consisting of three hundred and odd pages, to confute and expose errors which can only be undermined by the judgment and industry of philosophic historians. But it is Mr. Morris's great merit to have at least pointed out to the notice of intelligent readers a number of delusions to which the history of the Revolution is supposed to give countenance. Thus, he has shortly noticed the indubitable fact that the Terrorists were, with the possible exception of Danton, not men of marked ability, and by this mere statement has given a fatal blow to the illusion that at periods of excitement, popular judgment being as it were inspired, the instinct of the people becomes a substitute for statesmanlike prudence. The notion, however, that a politician who commits great crimes must therefore be a great statesman is happily, in spite of declamation and sentimentality, being dispelled by the force of ordinary good sense and common moral feeling, and it is a proof that mankind does, after all, make some slight progress, that modern revolutionists have on the whole avoided the precedents of the guillotine and the *noyades*. It is of more consequence to call attention to other delusions which, to borrow the language of Bacon, may be termed revolutionary "idols," and are supposed to be supported by the facts of the great Revolution.

The most striking occurrence of the whole Revolutionary period is the repulse of the coalition by the arms of France. Make what deductions you will, the fact that the great military powers of Europe retreated before the half-organized levies of the French Republic; that the sovereigns who had sent forth their armies to restore the French king to power were defeated and routed, and their territories invaded by the Republicans whom they despised, remains, and always will remain, one of the marvels of history, bearing witness of the strength sometimes to be found in the national and political enthusiasm of an invaded people. But here, as elsewhere, a wonder has been transformed into a miracle. The received legend is that the armies of Europe set forth against France at a time when her forces were entirely dissolved, and that the European coalition was met by bodies of Republican volunteers who, under a Dumouriez, beat back the trained veterans of Austria and Prussia. The legend is undoubtedly grounded on fact, yet, taken alone, it is almost as misguiding as a pure fiction. France, it is forgotten, had been before the Revolution the great military nation of Europe. Her armies were in one sense dissolved when she was attacked by the coalition, because the result of the recent changes had been to break up the existing organization, but she was full of soldiers. Dumouriez's army was not by any means a mere volunteer force. He had in his ranks numbers of soldiers trained under the old régime. His troops, moreover, were as it was all but defeated, and defeated just because they consisted in great part of raw recruits. The men who in a year or two carried the tricolor into all the capitals of the Continent, exhibited in their first campaign all the defects of volunteers, and in spite of Dumouriez's generalship would have been routed had their opponents acted with vigor. For it is again forgotten, and this oversight is fatal to a true comprehension of the military history of the Revolution, that the coalition were not really united. If Brunswick in 1792 had been half as determined to reach Paris as was Blücher in 1814, the Prussians might, for all the heroic efforts of France, have crushed for a time the forces of the Revolution. Disunion among the allies, bad generalship on the part of Brunswick, and the existence of all the elements of military strength among the French nation, do not in the least deprive of their due fame national efforts which ought to be specially borne in mind at a time when there is a marked tendency to underrate the military prowess of France, but they do afford an explanation of the Revolutionary victories, and conclusively show that these successes lend no support to the idea that popular enthusiasm can of itself fit untrained vol-

* 'The French Revolution and First Empire: An Historical Sketch. By William O'Connor Morris.' London: Longmans, Green & Co. 1874.

unteers to meet bodies of trained veterans. "The efforts," writes Mr. Morris, "of France to resist her foes were heroic, and have hardly perhaps been ever surpassed, but should not blind by false illusions. The allies might without the least difficulty have entered Paris in the summer of 1793, and, memorable as its struggles were, the Revolution triumphed only through the divisions and negligence of its antagonists." This is the conclusion drawn by common-sense from the undoubted facts of the case. It is at once curious and melancholy to reflect that "illusions," based on erroneous views of history, have led revolutionary leaders of even such genius as Mazzini into errors of policy which resulted in the futile sacrifice of many of the best and bravest democrats of Europe.

The delusion that volunteers could meet trained veterans and defeat them by the force of mere enthusiasm, was no doubt an error; but it was an error clearly suggested by a superficial view of the facts of the great Revolution. It was in fact a mistake which could hardly be avoided by those who did not command the knowledge which the present generation possesses of the secret intrigues of the allied powers. A more curious, because far less plausible, illusion is to be found in the idea that in a popular insurrection the insurgents have a fair chance of defeating soldiers really inclined to use their arms. This notion is one which, till recently, was entertained by kings no less than by democrats. A student of the movements in 1848 will see that one crowned head after another yielded to mobs which might have been dispersed by the use of a very small body of troops whose fidelity could have been relied upon. Monarchs fell in panic dread of popular insurrection, just as democrats entertained superstitious belief in the certain success of hastily armed insurgents fighting behind barricades. The strange point is that the whole history of the revolutionary movements from 1789 down to 1870, gives scarcely any support whatever to the terror of monarchs or the confidence of revolutionists. What history does show is that troops cannot be relied upon to put down an insurrection with which they themselves sympathize. But history as conclusively shows both that trained soldiers will rarely, under proper guidance, fraternize with insurgents, and that, unless the troops desert, citizens have even under favorable circumstances no chance of success in a combat with a military force. During the whole of the great Revolution there were but few occasions on which the mob were met by troops really inclined to resist them. On the 10th of August, the Swiss would almost certainly have routed their antagonists if they had not been deserted by the king. On the 13th of Vendémiaire, Bonaparte showed that the famed sections of Paris could be put down by any general prepared to make use of grape-shot. The history of 1848 and of 1870 reads exactly the same lesson. Cavaignac suppressed the most formidable insurrection which Paris has witnessed by the use mainly of National Guards and of young Gardes Mobiles, drawn from the very populace against whom their arms were turned. The army which had been defeated on every battle-field of France, which was half-disorganized, and perhaps more than half-sympathized with the insurgents, was yet strong enough to put down the Commune, which had held possession of the capital for weeks, which had in its ranks numbers of trained soldiers, which commanded the services of at least one skilful commander, and was, moreover, supplied with arms, forts, and artillery. The triumphs of Garibaldi may perhaps be cited in proof of the strength to be found in volunteer levies, but Garibaldi was himself a first-rate guerilla leader. He was in his Sicilian campaign accompanied by military adventurers, and even there he triumphed rather by the sympathy of the armies sent against him than by the force of his own troops. He might have been foiled at last at Gaeta but for the aid of the Italian army, and Mentana bears witness how little his volunteers could effect against disciplined soldiers. It would in many respects be well for the chances of human freedom could rational men believe that a brave people could always in a last resort protect their liberties by insurrection. But experience proves that in war, as elsewhere, trained skill must triumph over untrained ignorance, and forbids the illusion that what is called the people rising in its might will be found to be anything else than a mob doomed to slaughter by its weakness.

The most deep-seated of all revolutionary delusions is the belief in the effect of words and phrases. How deeply rooted the belief is may be understood by any one who will observe with intelligence the history of modern revolutions. To many leaders it is quite clear that the word republic has come to possess a magic force. Within the last two years all the world has seen the Republicans of Spain refuse to support a monarch who sacrificed his position rather than break through his constitutional obligations, and who from his position was compelled to act as a supporter of political freedom and religious liberty. But Castelar preferred the uncertainties of revolution and a nominal republic to the reality of freedom under a constitutional monarch; and, whatever may be thought of his wisdom, acted in strict conformity with the revolutionary belief in the supreme consequence of words. This superstition or creed is obviously derived from the supposed facts of the First Revolution. It is certainly the case that words and formulas possessed or seem to have possessed at that period an influence which modern students find it hard to appreciate. The ground of this importance is probably at bottom that the revolutionary symbols, such as the pretentious dogmas of the rights of man, gave expression to the general feeling of European society, which at the end of the last century longed, and rightly longed, to get rid of the burdensome relics of feudalism. What was really important was not the formulas, but the sentiment to which the revolutionary dogmas appealed. As the French armies advanced on to foreign soil, they found themselves in the midst of populations who either actively welcomed, or at the lowest passively aided, armies which promised to bring deliverance from oppression. The rights of man, the proclamation of human equality, and the promise of universal fraternity, were in fact the passwords by which lovers of freedom recognized one another throughout the world. The greater part of European nations have now attained the kind of freedom for which at the end of the last century all rational men sighed, and, until the Revolution broke out, sighed in vain. The old forms and words have lost their meaning because the feeling which they expressed has more or less passed away. The history of the Revolution proves the force not of words, but of widespread sentiments. To believe in the magic effect of democratic formulas is to mistake the form for the substance, and to cherish the most dangerous because the most subtle of revolutionary delusions.

THE MAGAZINES FOR SEPTEMBER.

IN *Scribner's* Mr. John Burroughs writes some notes of travel. The name, "Mellow England," which he gives to the country which he visited, indicates the general impression produced on him by his journeyings, and this he pleasantly conveys; but the interest of his notes is their particularity—a recipe for interest which one might wish all travellers would have, did the world not know too well the kind of particulars to which nine in every ten of us would make the others listen. Mr. Burroughs, who is great in woodcraft, found his first refuge from the effects of his very inferior seamanship in watching for the birds that lighted in the ship's rigging. Not the sea-birds, with which he professes no sympathy, but the lost birds of the land which had disastrously missed their course: "No doubt," he thinks, "the number of our land-birds that actually perish in the sea during their autumn navigation, being carried far out of their course by the prevailing westerly winds of this season, is very great." On the other hand, if a land-bird perishes at sea, a sea-bird is equally shipwrecked on land, and Mr. Burroughs has known the Sooty Turn, with its almost omnipotent wing, to fall down in utter exhaustion two hundred miles from salt water; the want of food in this case doing what the combined want of food and of rest does in the case of land-birds cast away at sea. Making port and travelling through Southern England, Mr. Burroughs was first struck by the uninhabited character of the landscape and by its beauty as a garden; it seemed as if not only the land were tilled by gardeners, but as if the virtues of generations of gardeners had been worked into the soil itself. Then, returning to his birds, he wonders at the enormous number of them. He believes that were all the birds in the United States to be gathered into any two of the largest States they would not people the earth and air as Southern England—earth, water and sky—is peopled by its clouds of various kinds of fowl. Among these he by-and-by heard the sky-lark, and his description of its song, if not exactly that given by the poets, is worthy of the songster's repute. He makes bold, however, to doubt if poetry reports with exact accuracy when it loses the lark "at heaven's gate" in "a privacy of glorious light." About four hundred feet, this gratuitous sceptic thinks, is as high as those sky-larks went which he saw on the South Downs. He adds, however, that though he could follow the bird with his eye and see it all the while as it was making its greatest altitude, yet if he took his eye off he had a difficulty in finding his lark on looking for it again. He is candid enough to add further that perhaps in the spring-time, when the bird's heart is fullest of its impulse of song and its body fullest of strength—the time when the poets have naturally been busiest with it—the flight may be higher than in the autumn; and moreover, by reason of the lesser clearness of the vernal atmosphere, the bird may then more easily arrive at the point of invisibility. With the original statement as thus modified, no one will probably find fault. The sky-lark's song Mr. Burroughs found much less melodious than that of some of our birds, as for instance, that of the bobolink in the meadows, the vesper sparrow in the pastures, the purple finch in the groves, the winter wren, or any of the thrushes in the woods, or the wood-wagtail, whose song is like the sky-lark's, but even more rapid and ringing, and delivered in a similar manner. "But the wonder of it is its copiousness and sustained strength. . . . Our birds all stop when the sky-lark has only just begun. Away he goes on

quivering wing, inflating his throat fuller and fuller, mounting and mounting, and turning to all points of the compass, as if to embrace the whole landscape in his song, the notes still raining upon you as distinct as ever after you have left him far behind." So good are the words of a competent observer that, even after Jeremy Taylor and all the rest, this description which we have quoted will seem worth having. As regards other English matters than bird-songs, Mr. Burroughs is an observer and philosopher who requires not so much attention. All that he says is true, and evidently it is a record of individual impressions, but it is not often new or important. Among its other contents, the September *Scribner's* has Mr. Bret Harte's chat about a young Chinese boy whom he once knew; some account of our New York City Normal School, an institution of which most of us know nothing; Mr. Edward King's travels in Alabama and Mississippi; and a story by Miss Constance Woolson, noticeable for the raw coarseness of its assault on the feelings, and the unsteady, unskilful hand with which some commonplace figures of fiction are drawn. Our band of heart-wrenching female dealers in false feeling was never, we think, so numerous as now. Some of them are better, some worse, but all their performances, from Mrs. Harding Davis's down to "Saxe Holme's" and her companions, have the general truth of sentiment of a romance by the leading graduate of a young ladies' seminary. Their good effects on their writers and their readers may be guessed.

In the September *Atlantic*, Miss Woolson has another tale, wildly improbable, destitute of the truth of fact or the truth of fiction, which appears under the title of "The Lady of Little Fishing." It is of this as much as of her story in *Scribner's* that we are thinking when we speak of the large school of female writers to which she belongs, and of whom there is none who seems able to keep on her feet and write a moderate word when the reader's feelings are to be touched, by the display of the throbbing feelings of the characters. Of the uses of restraint and of the nature of reserve they seem to have really about as much conception as if they wrote letters for the Beecher-Tilton case; and of good sense as little. They are, in a strict and now obsolete sense of the word, indecent.

The *Atlantic* for September is not a very good number. Mr. Howells's story goes on; Prof. N. S. Shaler writes popularly, and with an occasional dip of the pen into the purple ink, about the moon; Mr. J. J. Jarves, with an evident fondness for the place, writes enthusiastically about an Italian village in the Apennines, and about its happy unsophisticate population; Mr. G. C. Eggleston describes the merits of the Confederate currency in a way that should please Mr. Bundy of Ohio; and there is, finally, a narrative of a journey in Chinese inland waters which attracts curiosity, but does so without repaying it. These articles are to be called fairly good, except Mr. Howells's, which is more than that; but apart from these and the book-reviews, the contents of the *Atlantic* are noticeable for other qualities than goodness or readability. Half-a-dozen of them together are such as to be considerably below the standard of poorer magazines than the *Atlantic*. There is nothing, for instance, in "A Vision of Lost Souls" which would seem capable of overbearing its resemblance to the very highly mannered "Blessed Damozel" of Mr. D. G. Rossetti. Two of the stanzas of "The Vision" we quote:

"And haply may God's Christ
Bend down from his high seat,
Or send his angels, who
Shall guide our wavering feet;
And cannot love's self make
Each bitter thing seem sweet?

"He stooped and kissed her hair
That glimmered golden red;
She leaned on him as when
On earth they two were wed;
And heaven was in her face
And peace—no word she said."

In the publication of such a poem as this in the *Atlantic* there appears to us to be a failure of taste and of judgment which is unaccountable, unless, indeed, it is intended that Mr. Bret Harte's remarkable imitation of Mr. Browning's "The Statue and the Bust" shall be followed in the magazine by similar excessively close imitations of all the celebrated pieces of contemporary poetry. The book-reviews of this month are of more variety and liveliness than usual, though not of more ability—Mr. Proctor, the English astronomical lecture-maker and book-maker, being talked about in a way to surprise and horrify Mr. James Redpath and all the other lecture-course agents and hundreds of thousands of the purchasers of the *Tribune's* "Lecture Extras."

All persons whom circumstances have thrown into the way of reading infinitely more magazine literature than falls to the lot of other human beings, will agree with us that while no one would say that *Lippincott's* is a magazine of great pretensions, or indeed of the greatest achievements in literature, there would nevertheless be difficulty in finding one in exchange for which they would more willingly throw away the matter, "cultured" or otherwise, turned out by the writers, great and small, of the other magazines. Doubtless the absence of pretension counts for much in bringing this about. A set comparison between the Philadelphia product and that of Boston and New York would probably show in the pages of the former a solid mass of the regulation article. But still there would also be found in *Lippincott's* a comparative freedom from staleness and familiar routine, which would command the good-will of the expert examiner. With the beginner the case would perhaps be different. This month Mr. Black's novel of "The Three Feathers" moves on; Mr. Adolphus Trollope contributes recollections of D'Azeglio, whom he greatly admired; "The Bearer of Despatches in London" is a tale which we imagine we must have dreamed before reading it here; "The New Hyperion" is as far from Paris as ever. In "Violins and Violin Players" persons interested may read an historic-anecdotical article of the kind periodically recurring in magazines, to the end, as we suppose, that each generation may know as much about violins (or Malays running a-muck, or the leaning tower of Pisa, or the Thugs, or the Austrian salt-mines, or the comparative longevity of animals, or Edmund Kean, or the great organ at Haarlem, or what not) as was known to the generation preceding it.

Old and New publishes an essay to which on its promised appearance in another form we may be able to give due attention, in which it is attempted to show that the character of Tiberius has been grossly and inconsistently blackened by Tacitus, and that the Emperor, neither tyrant nor debauchee, has for ages been made the victim of senatorial hate. The essayist, a Professor Huidekoper, is much in earnest, and evidently has satisfied one man of the good character of his hero.

Mr. Richard Grant White, in the *Galaxy*, discourses of the Abbé Liszt and his music. In what degree of esteem Mr. White holds this composer the reader learns very readily: "That dreariest of composers, Franz Liszt," whose compositions "remind us of some sermons that we all have heard, in which the doctrine was orthodox, the sentences well put together, the language pure, the illustrations scholarly, and the result barrenness"—Liszt, who "has probably covered more music-paper with his writings than Mozart and Beethoven did together" (having been working at music for more than fifty years), "and in all that time has not produced one musical idea that is worth one of the buttons on one of his old velvet paletots—not one which has character enough, even in its badness, to be recognized as one of his"—Liszt, of whom it is true to say that "the more he writes and the harder he works, the more does the stony sterility of his mind appear"; "who spends the first part of a movement in announcing that something is coming that never comes, and the last in subsiding from a climax that has never been reached"; who, finally, "for every deed of his not done on the piano-stool ought to sit on the stool of repentance." If Liszt, both as composer and as a life-long monument of curious affectation and indulged petty insolence, moves Mr. White to wrath, he is little better pleased with the Abbé when he thinks of him as a champion of "the music of the future," although he believes Liszt's proper place to be in Herr Wagner's camp, and believes, moreover, that Liszt's friendly patronage of Wagner was much to his personal credit. But still, in Mr. White's view, a musician who professes a devotion to the music of the future is simply a musician who is ignorant of the first principles of the art of which he wishes to be a practitioner, and, as such, is in heresy and schism; the latter part of his essay is therefore as warm as the former part, and, if the former will be disliked in the Conservatories, the latter will call to arms many loud-clanging warriors who follow Mr. Theodore Thomas in the cause of Wagnerism.

Other articles in the *Galaxy* are one by General Custer, and the first half of a depreciatory sketch of Marshal MacMahon, by M. Elie Reclus. M. Reclus is republican enough to think monarchs an infamous class of creatures, and of MacMahon he is free to assert that while at Metz Bazaine betrayed only the Empire, at Sedan MacMahon betrayed France. General Custer is as verbose as usual, and writes with an attention to the judicious breaking-up of his narrative into magazine lengths which does not savor very much of the camp, and, indeed, it may be the magazine office that is responsible for this. As for the verbosity and other defects of writing, they will no doubt maintain themselves in use among our literary army-officers till English is reasonably well taught at the Academy—if not afterwards, in fact.

Of *Harper's* we may say that the reader not having a monthly familiarity with the magazine will find in the September number an article on the materials used in making a long list of perfumes, the method of their preparation, and other points of interest about them. The *Catholic World* for this month contains nothing of interest to the secular reader.

The Centennial Gazetteer of the United States. By A. von Steinwehr, A.M. (Philadelphia: Zeigler & McCurdy.)—This work derives its chief

and exceptional value from the fact that it is the most recent of its kind. Its list of names is therefore more complete and its statistics more trustworthy, the compiler having had the benefit of the results of the Ninth Census. The typographical execution is very good indeed. Some fifty pages of description of the United States serve as an introduction, and deal in a competent manner with the physical geography of the country, its population, industries, etc., ending with an outline of the form of government, and a condensed history from the session of the first Colonial Congress. In discussing the present white population, General von Steinwehr roughly estimates the number of Anglo-Saxons at 8,340,000; Germans, of all countries, 8,930,000; Dutch and Scandinavians, 728,000, or a total of 17,998,000. The Celts, principally Irish, amount to 10,255,000; the Romanic nations to 1,016,000; and all other nationalities to 4,326,000, leaving a balance of about 2,400,000 in favor of the Germanic stock. "Were the fusion of these diverse elements complete, then, of 100 drops of American blood, 25 would be Anglo-Saxon, 27 German, 2 Dutch or Scandinavian, 30½ Celtic, 3 Romanic, and 12½ uncertain." Our distressingly unregulated town nomenclature is made apparent on every page of this gazetteer. As an example we take the name of *Lincoln*, which we might naturally suppose to have multiplied since 1861. In the first edition of Lippincott's Gazetteer the name occurs fourteen times in the United States, and in the appendix to the revised edition of 1865–6 thirteen times—in all, twenty-seven. It is specially mentioned under Lincoln, the capital of Logan Co., Illinois, that "this place, the origin of which is quite recent, was named in honor of President Abraham Lincoln." Now comes the 'Centennial Gazetteer' with upwards of 115 towns, townships, and counties called Lincoln, and it is probably fair to assume that the increase (about ten per annum) is almost wholly due to the same motive which determined the naming of the Illinois town. It is further to be remarked that Iowa, which had but one Lincoln in 1866, now endures the confusion of twenty-five.

Compendious Dictionary of the French Language. French-English; English-French. By Gustave Masson. (New York: Macmillan & Co. 1874.)—Purchasers of this handy volume will get the usual vocabulary and definitions in a compact and clearly-printed form, but in place of the usual pronunciation of the French words their etymologies, as given by Littré, Schéler, and Brachet. This feature is carried still further in a separate list of the principal diverging derivations in the language, taken from Brachet's 'Dictionnaire des Doublets,' as, for example, *catafalque* and *échafaud*, from Low Latin *catafalcus; Cravate* and *Croate; nombre* and *numéro; libération* and *livraison (liberationem)*, etc. But above all will be valued the tables prefixed to the Dictionary proper. These are: (1) Chronological tables of the history of French literature from the ninth century to the Second Empire. Not only the chief writers, but the momentous political events of each period, are enumerated, and its characteristic literature analyzed, with groups of writers and titles of works which it is extremely convenient to have in such small compass for ready reference. Another very useful list is (2) that of the principal chronicles and memoirs on the history of France from the days of Villehardouin (1160–1213) to the present time, ending with the Comte Philippe de Ségur's 'Histoire et Mémoires.' Then follow (3) a synoptical table of the principal *chansons de geste* composed in the *langue d'oïl*, indicating those which have been printed; (4) a synoptical table of the French mediæval dialects, after M. Fallot; (5) a chronological list of the principal French newspapers published during the Revolution and the First Empire; (6) a concordance of the French Republican calendar with the Gregorian; and (7) the Republican calendar itself. It will be seen that the dictionary is no ordinary compilation, and that its merits recommend it to all who seriously undertake the study of French.

Famous Trials. The Tichborne Claimant; Troppman; Prince Pierre Bonaparte; Mrs. Wharton; The Meteor; Mrs. Fair. By John T. Morse, jr. (Boston: Little, Brown & Company. 1874.)—Mr. Morse has, in this collection of essays (mainly reprinted from the *Law Review*) made an entertaining contribution to a kind of literature which stands midway between history and the newspaper criminal reports—not quite as pretentious as the former kind of writing has in these later days become, not so dry and detailed as the latter. The stories of the various trials are told in an entertaining and vivid manner, and if they do not add much to our previous knowledge of the subject, they are presented in an entertaining way. The longest and most elaborate of course is that of the Tichborne Claimant, while the most strictly novel and foreign to American readers are those of Troppman and Prince Bonaparte, giving as they do some insight into the peculiar judicial proceedings which in France are considered as conducive to the elucidation of truth. The French judge, bullying and browbeating not only the witnesses, but the prisoner at the bar, or it may be sustaining and encouraging him if he is a prisoner of the right kind, is one of those social monstrosities to which the Anglo-Saxon reader can only reconcile himself by reflecting that the prisoner and witnesses, as well as the judges, are French.

HENRY HOLT & CO.,
25 BOND STREET, NEW YORK,

Publish Freeman's Historical Course, Fiske's Class-room Taine, and many other Text-books of equal merit, including most of those for Modern Languages used at Yale, Harvard, and similar institutions. Among their miscellaneous publications are works of Maine, Mill, Taine, Tylor, Turgénieff, and many others. Catalogues free.

PEEPS AT OUR SUNDAY-
Schools. By Rev. Alfred Taylor. 12mo, price $1 25. Sent by mail on receipt of price.

Full of interest to the friends of Sunday-schools. The author carries you with him on his visit to the schools, and makes the trip an exceedingly lively, pleasant, and profitable one. In his preface he says:

"As you go with me to look at the Sunday-schools, and we enjoy our brief glimpses at them, please to remember that these pages are not meant to contain finely spun theories or didactic disquisitions on what a Sunday-school ought to be, but rather pictures of what our schools are."

805 Broadway, New York.

THE FAMOUS BEAUTIES OF the Court of Charles II. always wore ENGLISH CHANNEL SHOES. They never have ragged soles, wear longer, and cost no more. Ladies, make your dealers get them for you. The place where the channel is cut shows on the sole.

HARPER'S CATALOGUE. The attention of those designing to form libraries, or increase their Literary Collections, is respectfully invited to Harper's Catalogue, which comprises a large proportion of the standard and most esteemed works in English Literature—*comprehending over three thousand volumes.*

Librarians, who may not have access to a trustworthy guide in forming the true estimate of literary productions, will find this Catalogue especially valuable for reference.

The Catalogue is arranged alphabetically by the authors' names, anonymous works by their titles. The index is arranged by the titles of the books, besides having numerous appropriate heads, each general head being followed by the titles of all works on that subject.

Harper's Catalogue sent by mail on receipt of ten cents.

IN PRESS.

(Ready early in September.)

HOLDEN WITH THE CORDS.

BY W. L. M. JAY,

Author of 'Shiloh,' 'My Winter in Cuba,' etc.

E. P. DUTTON & CO., PUBLISHERS,
713 Broadway, New York.

American History.

BANCROFT AND PARKMAN.

Messrs. LITTLE, BROWN & Co. will publish in September two important contributions to American History, from the pens of George Bancroft and Francis Parkman.

A HISTORY OF THE UNITED STATES,

From the Discovery of the American Continent.

BY GEORGE BANCROFT.

With Portraits, Maps, etc. Vol. X., completing the work. 8vo, cloth, $2 50.

Price of the ten volumes, cloth, $25.

Vol. X. brings to a close this important work, which represents the labor of forty years, and has taken rank among the greatest historical masterpieces in all languages. The opinion pronounced many years ago by Edward Everett, in a review of one of the early volumes, that "it does such justice to its noble subject as to supersede the necessity of any other work of the same kind," has been confirmed by the highest literary authorities of England and the United States, and Bancroft's History has become a standard which at once satisfies the demands of patriotism, and induces the scrutiny of the most exacting critics.

"Among the historians who have attained a high and deserved reputation in the United States within the last few years, we are inclined to yield the first place to George Bancroft. His experience in political and diplomatic life, no less than his rare and generous culture, and his singular union of the highest mental faculties, enable us to predict with confidence that his work will be reckoned among the genuine masterpieces of historical genius."—*Westminster Review.*

The concluding volume treats of the period 1778–1782, narrating the momentous events, political and military, that crowded those memorable years, and terminating with a graphic picture of the surrender of Cornwallis and the close of the war.

THE OLD REGIME IN CANADA.

(France and England in North America, Vol. IV.)

BY FRANCIS PARKMAN.

8vo, cloth, $2 50.

This volume covers a century of the history of Canada, under French rule—1650–1750, and comprises pictures of the religious, political, social, and commercial life of the colony, drawn with the clearness and vividness peculiar to this author. He has searched assiduously the French archives, and brought to light for the first time a multitude of important and interesting facts bearing on Canadian history. From the recent correspondence between the French court and its representatives in the colony, he quotes extracts of especial piquancy, and which powerfully illustrate some curious phases of his subject. The book fascinates by the intrinsic interest of its theme and by the charm of its style; and, as exhibiting the simultaneous operation of the monarchical spirit, represented by the ambition of Louis XIV., and the mission spirit represented by Jesuit craft and enterprise, has a substantial historical value.

LITTLE, BROWN & CO., PUBLISHERS,

110 Washington Street, Boston.

LITTLE, BROWN & CO.,

Publishers and Importers, Boston.

THE WEEK IN TRADE AND FINANCE.

NEW YORK, August 31, 1874.

MONEY on call continues very abundant at 2 and 3 per cent., with the bulk of business doing at 2½ per cent. Commercial paper is in good demand at 5 and 6 per cent. for prime loans having a short time to run, while that running 3 and 4 months sells readily at 6 and 7 per cent.

Cable advices report a further reduction of ½ per cent. on the Bank of England rate of discount—the rate now standing at 3 per cent. The Bank lost £537,000 in bullion for the week ending on Thursday last.

The weekly statement of the Clearing House Banks on Saturday was favorable, the important features being the loss of $916,800 in specie, and gain of $1,391,200 in legal tenders. The surplus reserve shows a gain of $440,400 as compared with that of the previous week.

The following is a comparison of the averages for the past two weeks:

	August 22.	August 29.	Differences.	
Loans	$278,576,000	$278,319,800	Dec..	$256,200
Specie	19,554,900	18,638,100	Dec..	916,800
Legal tenders	65,891,400	67,282,600	Inc..	1,391,200
Deposits	234,864,100	235,000,100	Inc..	136,000
Circulation	25,820,000	25,803,300	Dec..	16,700

The following shows the relations between the total reserve and the total liabilities:

	August 22.	August 29.	Differences.	
Specie	$19,554,900	$18,638,100	Dec..	$916,800
Legal tenders	65,891,400	67,282,600	Inc..	1,391,200
Total reserve	$85,446,300	$85,920,700	Inc..	$474,400
Reserve required against deposits	58,716,025	58,750,025		
Excess of reserve above legal requirem't,	26,730,275	27,170,675	Inc..	440,400

The stock market, which opened strong and buoyant on Monday, subsequently became dull and heavy, and finally closed on Saturday at the lowest figures of the week. The chief feature of the market in the downward movement was Wabash, which was seriously hammered by the bears, who made use of the reported falling off in the earnings of the road as a means of depressing its market price. The decline in Wabash was equal to 2⅞ per cent., and the decline on the balance of the list ranged from ¾ to 2 per cent., the principal dealings being in Union Pacific, Lake Shore, Western Union, and Pacific Mail.

The market to-day was active, especially for Erie, which sharply advanced from 32¾ to 34⅛, in sympathy with the market in London, where an upward movement is being engineered. The advance in Erie is said to be based upon the recent closing-out in London of a loan for the Company, which was only partially subscribed for under the old management, but, when reopened by the new management, was promptly taken. The indications are, judging from the looks of the market to-night, that an upward movement in Erie has commenced, which bids fair to carry the quotation up to 40 before it is over.

The feature in the railroad-bond market has been the Income bonds of the Union Pacific R. R. Co. Of the original ten millions of these bonds, seven millions have been converted into the third mortgage 8 per cent. bonds, which the Company recently offered to give in exchange to the holders of the former at the rate of $12,000 of the new bonds for $10,000 of the Incomes. The Incomes fall due September 1, and it is said that, unless the Company pays the face value of the remaining unconverted bonds in cash, legal proceedings will be commenced to compel the Company to do so. We understand that the Company holds to its determination not to pay the bonds in cash, and will, if necessary, stand suit in the matter. During the early part of the week, the Incomes advanced to 87¼, but subsequently, when an effort was made to sell, the price quickly dropped to 85, the bonds being offered at that this afternoon with no bid.

The following shows the highest and lowest sales of the leading stocks at the Stock Exchange for the week ending Saturday, August 29, 1874:

	Monday.	Tuesday.	Wed'day.	Thursday	Friday.	Saturday.	Sales.
N. Y. C. & H. R...	102¾ 103⅜	.... 102⅞	102⅜ 102⅜	102¼ 102⅜	102¼ 102⅝	101⅜ 102½	10,900

C. C. & I. C.....	 13	12½ 12⅝	12⅛ 12¼	11⅞ 12	12 12¼	11⅜ 12	4,100
W. U. Tel.....	77 77⅜	77⅛ 77⅝	76½ 77	76¼ 76⅜	76⅜ 76⅞	76½ 76⅝	167,100
Pacific Mail	47¼ 48⅛	47½ 48¼	47⅝ 48⅛	47⅜ 47⅝	47½ 47⅝	47⅜ 47⅝	70,700

In Government bonds prices have been well maintained in the face of only a moderate demand for home account. Prices closed a fraction higher than last week. The following are the closing quotations to-night:

	BID.	ASKED		BID.	ASKED
Registered 6's, 1881, c.....	118½	118⅝	Registered 5-20, 1867, c.....	117⅝	117¾
Registered 5-20, 1862, c.....	112¼	112⅜	Registered 5-20, 1868, c.....	117⅝	118
Registered 5-20, 1864, c.....	115⅞	116¼	Registered 10-40's, c.....	114⅜	114⅝
Registered 5-20, 1865, M and N.	116⅞	117⅛	Registered 5's of 1881..	112⅝	112⅝
Registered 5-20, 1865, J and J..	116⅜	116⅝	U. S. Currency 6's.....	117¾	118

The quotations for gold have ranged between 109⅝ to 110. The short interest in gold is considerable, and is indicated by the fact that a small bonus was paid for its use at different times during the week. At the Treasury sale of $1,000,000 on Thursday, the total amount bid for was $4,470,000, which shows that there is a good demand for it. The shipments for the week were inconsiderable in amount, and mostly of foreign specie *in transitu*.

The following shows the range of quotations for every day during the week ending August 29:

	Opening.	*Highest.*	*Lowest.*	*Closing.*
Monday, Aug. 24.....	110	110	109⅞	109⅞
Tuesday, Aug. 25.....	110	110	109⅝	109⅝
Wednesday, Aug. 26.....	109⅝	109¾	109⅝	109⅝
Thursday, Aug. 27..	109⅝	109¾	109⅝	109¾
Friday, Aug. 28.....	109¾	109¾	109¾	109¾
Saturday, Aug. 29.....	109¾	109¾	109⅝	109¾

SPECIAL NOTICES.

TERMS: In advance, one insertion, four cents per word; five insertions, three cents per word, each. The enclosure of a stamped and addressed envelope will secure a numbered box, to which communications may be addressed.

A Visiting Governess, accustomed to teach English, French, and German, has spare hours. Address Box B, *Nation* Office.

An Experienced Teacher desires a situation to teach in a public or private school. Address Box 213, Terryville, Conn.

A Harvard Graduate, Private Tutor in Cambridge, wants a pupil for the coming College year. Has experience and city references. Address Box 16, *Nation* office.

A Graduate of Harvard College would like two or three Pupils to fit for College or otherwise. Best references. Address Box 17, *Nation* office.

Those Seeking Admission to Harvard, Yale, or any other American College, to Sheffield or Lawrence Scientific School, or any School of Technology, can receive thorough preparation at ROGERS HIGH SCHOOL, Newport, R. I. Special provision made for Laboratory Practice. Tuition, $60 per annum. Frederic W. Tilton, A.M. (late Principal of Phillips Academy), Head-Master.

For Sale.—Vols. X. to XIV. of the Nation inclusive, bound in boards, with red-leather backs. Price $2 50 each if taken together. Address the Publisher, Box 25, New York.

Mr. George Street, London, Agent of the *Nation* for Great Britain, receives Subscriptions and Advertisements for this paper. GEORGE STREET, 30 Cornhill, London, E.C.

No. 369 of the *Nation* wanted (dated July 25, 1872), for which 15 cents will be paid. Address the PUBLISHER, Box 25, New York.

School of Mines, Columbia College.— Courses in Mining and Civil Engineering, Geology, Mineralogy, Chemistry, Assaying, etc., etc. Send for catalogue. C. F. CHANDLER, Dean of Faculty, East Forty-ninth Street, New York.

University of the City of New York.— Medical Department. Address PROF. CHAS. INSLEE PARDEE, M.D., 426 E. 26th Street., New York City.

The Nation.

NEW YORK, THURSDAY, SEPTEMBER 10, 1874.

The Week.

THE President has determined to put a stop to the disturbances in the South by the use of all means in his power; and has given general directions to the Attorney-General and the Secretary of War to take what steps may be necessary in the premises. The Attorney-General has accordingly issued a circular to United States attorneys and marshals, calling their attention to the provisions of the Civil Rights Bill, passed April 9, 1866, the Enforcement Act, passed May 30, 1870, and the Ku-klux Act, passed April 20, 1871, which, with their amendments, he says, "make these deeds of violence and blood offences within the jurisdiction of the General Government." He directs them to spare no pains to arrest and punish the perpetrators of outrages, informs them that troops will be established at convenient points to give them all the aid they may need, and warns them not to interfere in politics, but devote themselves to the protection of the lives and property of all classes of citizens. The President's letter to General Belknap reads well enough, and the reference to the Attorney-General is no doubt intended to produce an impression on the public mind of law-abiding intentions at Washington.

Unfortunately, the Attorney-General has not much of the confidence of the public, and his caution about interference in politics will not tend to strengthen what there is of it. Comparing his circular with the laws referred to in it, it looks as if the Attorney-General had not yet made himself familiar with the contents of these acts. The second section of the Enforcement Act provides that whenever in any State or Territory any act is required by law as a "prerequisite or qualification for voting," and by the local laws any "persons or officers" are "charged with the performance of duties in furnishing to citizens an opportunity to perform such prerequisite, or to become qualified to vote," it shall be the duty of any such official to furnish such opportunity to such citizens alike, without distinction of race, color, or previous condition of servitude; the penalties for refusal or wilful omission being a liability in damages to the amount of $500, with costs and allowances to the aggrieved citizen, and also a criminal prosecution with the penalty of fine and imprisonment. Another section makes it a misdemeanor for any person to interfere with the right of voting in various ways, and enumerates such as threats of depriving voters of employment or occupation, of ejecting them from rented houses or lands, and of refusal to renew leases or contracts for labor. How this law is to be enforced without a very minute supervision of local politics we do not know, and indeed, considering that the application to the President for troops comes chiefly from notorious Southern politicians like Kellogg, and on the eve of important elections, the whole thing looks like a disingenuous attempt to bring about political ends under cover of a laudable effort at the preservation of the peace.

The Southerners are apparently learning, however, that it will be well for their own interests to discontinue lawlessness, and that the effect of Southern outrages of any kind is to strengthen the hands of the Republican party. As an instance of this, we may mention the fact that the Republican chieftains in this State are reported to be rubbing their hands over the Coushatta affair and other disturbances, and maintaining that the Democrats are not so strong here now as they were six weeks ago. The Coushatta murders are not fully explained yet, but it seems to be established that the "Conservatives" in that part of the country, having come to the conclusion that the blacks were engaged in a conspiracy against the whites assembled in force and demanded the resignation of the Republican office-holders, who were all, or nearly all, white. They then proceeded to convey these office-holders out of the State or to some distant point; but while on their way a "rescuing" party appeared, took the prisoners, and immediately put them to death. Whether there was any real negro conspiracy, whether the escort behaved in good faith, or who the murderers were, will probably never be determined. The *Tribune* has a report that the President has decided upon a plan of action with regard to Southern Federal appointments which ought to have a better effect than the Enforcement or the Ku-klux Acts in quieting the South. This is nothing else than to turn out of office all the incompetent officials who owe their commissions to the Republican Senators, and are scattered over the South in great numbers, and fill their places with new and suitable men—and to do this whether the Senators agree to it or not.

The Vermont election passed off very quietly, the Republicans carrying the State by a large majority, as usual. Public interest principally centred in the Congressional Districts. In the District hitherto so well represented by Mr. Willard, the regular nominee, Mr. Charles H. Joyce, was rewarded for his fatiguing campaign by an election; while Judge Poland has been defeated through dissatisfaction caused by the spectacle of his recent career in Congress. Judge Poland, as far as one can make him out from his own speeches and Congressional proceedings, represents a class of politicians who in some way contrive by their curious attitude in all important matters to make respectability itself disreputable. Mr. Poland has had a good enough reputation, and in deportment he is said to be irreproachable; he never does anything in Congress hastily or angrily; never gives his fellow-members the lie direct, never shakes his fist in their faces, but on all occasions conducts himself in a dignified and strictly parliamentary manner; he is an educated man, also; nevertheless, he is best known to the public at present as the author of the "Poland Gag-law" and of the Crédit-Mobilier report, and the defender of the "Back-pay grab." This dubious record has ruined him in Vermont, and another election will be held to choose his successor—the first having resulted in no choice. In the second, a plurality will suffice, and to all appearances the man who at present stands the best chance is well fitted in every way to fill the vacancy.

The People's Convention in Missouri, as it is called, has been held, has adopted a platform, and made nominations. The resolutions declare that long and painful experience has taught the people of Missouri the folly of confusing local affairs with those relating to the National Government and of electing State officers on partisan issues; demand the suppression of lawlessness and mob violence, "without regard to popular feeling"; denounce "proscription" for political differences of opinion; declare that to encourage emigration and investment the State needs a "faithful enforcement of the law." They demand strict fidelity to obligations of all kinds, oppose the increase of the State debt, and make noncommittal declarations on the subject of transportation and the currency—the hard-money men in the convention avoiding a struggle over the last question as being a "national issue," though it is not apparent why as a national issue it is spoken of at all. The material of the convention was thoroughly popular, and as the Republicans have since resolved not to make any nominations, the chances of success of the Independent movement have suddenly become very good. Mr. Gentry, the "People's" candidate for governor, is a wealthy farmer. Among the resolutions we notice one which indicates the tide of public feeling as to the value of our legislative bodies. One of the

planks in the platform declares the convention in favor of a constitutional provision requiring a session of the Missouri Legislature only once in four years, "unless in case of emergency." The Ohio Republicans have renominated their State officers, and adopted a platform "reaffirming the principles" of the Republican party, declaring for a tariff for revenue with incidental protection, denouncing all forms of repudiation, demanding the restoration of specie payments "gradually but certainly," and condemning the Southern outrages.

A correspondent writes to us from Massachusetts to say that there is grave reason for supposing General Cogswell, who has announced his willingness to run against Butler for the Congressional nomination in his district, to be really a Butler man in disguise. We had noticed this story already as one of the perplexities of Massachusetts politics, and take this opportunity of saying that we do not profess to have an intimate acquaintance with all the ins and outs of Butlerite politics, and do not know on what foundation the rumors about General Cogswell rest. But we have never seen any substantial proof of their truth, and there is no doubt whatever that the declaration of principles recently made by him is one of the very few straightforward, honest, and enlightened expressions of opinion about really important questions that have appeared for a long time from the benighted district represented at Washington by Butler. It is a platform to which a constituency can hold a man, which is more than can be said of most platforms, and it seems to us almost beyond the bounds of belief that its author could be in secret alliance with Butler. If he is, there ought to be some proof of it; for in that case, he is one of the most enormous hypocrites and rascals now at large in the United States, which is not exactly the character he has generally borne among his acquaintances hitherto. Of course, if a better man can be found, there will be no reason for nominating General Cogswell.

The discovery of gold in the Black Hills has caused a good deal of excitement in some parts of the West, and there are stories of the formation of expeditions at Sioux City and Yankton for the invasion of the country. General Sheridan has taken means to prevent this, by issuing an order directing the arrest of any persons concerned in violation of the Indian treaties in such an attempt, the burning of their trains, and destruction of their outfit. The Black Hills country really belongs to the Indians, and the Government is greatly to blame for the publicity it has given to the gold discoveries. The expedition of General Custer seemed from the outset—provided, as it was, with sensational correspondents, and led by a military man acting as chief of the corresponding staff—as if almost designed to bring about the very invasion which General Sheridan is now trying to prevent. There could certainly be no better way devised of sending off half of the desperadoes of Sioux City or Yankton towards the Black Hills. It is fortunate for General Custer that he is not in the "political arena"; if he were, the letters and despatches would probably be explained as the result of an arrangement with the gold-men, and exceptionally wise statesmen would be shaking their heads over him as having been, like so many others, "bought up." We suppose the real explanation is to be found in the reckless disregard for professional etiquette of any kind that distinguishes the conduct of the Government.

The *Tribune* has a correspondent in the West who sends on nearly every week, besides much useful information about the railroads, some curious scraps of Granger morality and philosophy. In a recent letter, in defence of the Potter law, he explains that large numbers of farmers in the State mortgaged their farms in order to buy stock in new railroads, which afterwards borrowed money on mortgages, and then the mortgages were foreclosed and the farmers' stock became worthless. He argues, therefore, that there is "something wrong" in all this, and that the farmers who have sustained these terrible losses are now justified "in fighting the railroads." What this means is simply that the farmers foolishly borrowed money to invest in railroads, which they lost. Hundreds, if not thousands, of people in this city are to-day exactly in this predicament. They have lost heavily by buying the stock of new roads, which the mortgagees, who were entire strangers to the original transaction, have taken away from them under a lawful contract. Now, what would be said if they were to assemble in large crowds at the offices of the companies, with sticks and stones, and declare that the bondholders must receive no interest, or have it reduced, in order to reimburse the poor fellows who had lost their money in the speculation? Is it possible that there is one code of morality and of mercantile usage for the Holy Farmer, and another for the poor trader or lawyer or mechanic? Why is it lawful for an unfortunate speculator to rob railroads in the West because he has lost money in them, any more than here? If a New York artisan buys a Milwaukee and St. Paul bond, valid under the law of the land, why has he to share his interest with a Wisconsin Granger who years ago speculated unfortunately in the stock, any more than with an unlucky railroad man here?

The general dearth of topics of interest in the newspapers shows what a godsend the Beecher-Tilton case was. It is almost painful to see the meagreness of the items which the reporters are now able to pick up about it. In their distress they have already published the verification of the answer filed by Mr. Beecher in Tilton *vs.* Beecher, the certificate attached to the jurat, and the acknowledgment of service made by the plaintiff's lawyers. The only hope now is that Moulton will speedily produce that second "statement," which is daily expected. In the meantime, we must request Plymouth Church to stop praying publicly for Tilton. This disgusts the community, which is already much nauseated, and does Tilton no good. Plymouth Church has had charge of his moral and religious training, and has failed in it so miserably that we are confident that no petition it now utters about him will receive any attention. The affair has produced some very curious suggestions for the regulation of the relations of the clergy with their flocks, amongst others, one that the minister's unfortunate wife should accompany him wherever he pays pastoral visits. It would seem to be plain enough that if pastors need surveillance in their domestic intercourse with their flocks, they ought to stop visiting. All remedies for evils such as are here hinted at have to be radical. The only thorough protection against being drowned is avoidance of water; and if ministers have to be watched when they call on ladies, the only adequate remedy is the cessation of calls.

The revival of the fall trade has, during the past few weeks, been a prominent subject of public discussion, and great and commendable activity has been displayed by reporters, and all connected with the press, in collecting facts bearing on the condition of business. The difficulty with these reports has been, not so much that they have been too complete, as that they have been, perhaps, too full of earnestness and fire, and hence now and then contradictory. We believe, however, that it is established that the fall trade has on at least one, if not two occasions, been entirely revived, though unfortunately, on the days when this took place, owing to the lack of effective means for keeping the movement going, and the absence of ready communication between the centres of business (the revival having come to a head toward sunset, and between the publication of the evening and the morning papers), it died out again after a few hours. A survey of all the evidence collected with regard to the arrivals of jobbers at the hotels, the bidding at auction sales, the announcement of withdrawals of foreclosure sales of real estate, will convince any impartial man that if there is not a sudden permanent revival of trade very soon, it will not be because the subject has not been thoroughly studied. One source of information, however, has as yet escaped observation;

and, for the benefit of the profession, we feel that we ought to call attention to it—and that is, the large boxes and packing-cases now standing in such great numbers on the Broadway sidewalks, in front of leading dry-goods establishments. We have not examined into the contents of these boxes, but this might easily be done after dark. If they were found to contain a "full line of dry-goods," they might be considered a distinct evidence of prosperity; if, on the other hand, they turned out to be empty, we do not know exactly what light the discovery would throw on anything, but we have that confidence in the ability of our brothers in the way of making inferences and generalizations that we have no doubt the discovery would prove to convey some valuable lessons. We should like, ourselves, to know what is in the boxes, and we think the public has a right to know.

The English papers, some even of those best acquainted with American politics, seem to be laboring under the idea that General Grant is determined by hook or by crook to get himself nominated for a third time. Even the *Spectator* fancies that if he cannot induce the Republicans to set him up, he will throw himself into the arms of the Democrats. After what the Democrats did in Greeley's case, it is of course not wonderful that foreigners should think it likely that they would undertake the job of putting Grant in the Presidency once more; but surely the result in Greeley's case ought to make it clear that no such candidate would have any chance of success. There is a public outside the ranks of both parties which punishes all such absurdities sternly, however carefully they may have been prepared at primary meetings and conventions. The "third term movement" never had any root in public opinion, and never received any countenance outside newspaper offices. General Grant cannot be either elected or nominated a third time, and he probably knows it. Even if the people wanted him, the politicians would not have him. He is no longer a winning card, and besides this, all the managers are satisfied that the time is coming for "a new deal." His return to private life is therefore certain, in spite of the dying out of all active opposition to him. From this he has been saved by his veto, and by the discovery that whether the Currency Bill means inflation or contraction, nobody has yet noticed any effects from it either way. In fact, the "Potter law" in Wisconsin is the one tangible result of all the "reform" movements which have been attempted under the Grant régime, and this reminds one of the mediæval priest who used to strip travellers on his way to say mass.

A controversy has been raging in England for two or three weeks, and occupying a large share of public attention, over the question whether a Wesleyan minister is entitled to prefix "Rev." to his name. A Wesleyan minister named Keet put up a headstone in the parish churchyard at his daughter's grave, on which he described her as the daughter of the "Rev. H. Keet, Wesleyan Minister." To the "Rev." the vicar objected, addressing himself to the stone-cutter, and refusing to hold any communication whatever with Mr. Keet himself. Whereupon the latter appealed to the Bishop, Dr. Wordsworth, who passes for a sensible and able man, but he sided with the vicar. Mr. Keet then went to the Archbishop of Canterbury, who condemned the vicar's conduct, and addressed Mr. Keet as "Rev.," and very courteously. The Bishop, however, stood his ground, and Mr. Keet then went before the public with the correspondence. The Bishop's position is that "Rev." is a title which belongs exclusively to the clergy of the Anglican Church, and that it is therefore wrong and inexpedient to give it to ministers of any other denomination, and he persistently addressed Mr. Keet as "Mr. Keet, Wesleyan preacher." The public appear, however, to have only one opinion about the matter, and that is that the conduct of the vicar was arrogant, ill-bred, and unlawful, and that the Bishop is all at sea in his logic, law, and social philosophy. A whole band of writers have rushed into print, showing that nobody is entitled legally to the prefix "Rev.," and that it is purely a title of courtesy; that its application even to Episcopal clergymen is of comparatively recent date; that it is officially given to ministers or religious teachers of all denominations; and that the vicar had no right to meddle with the headstone on this ground. The case is going into court, and there have been plenty of warnings addressed to the Bishop on the danger to the Church establishment of exasperating Dissenters about matters which are of no real importance to the Church, and in fact furnish materials for nothing better than petty insults.

Father Hyacinthe has resigned his charge at Geneva, on the ground that while he thought only of reforming the Catholic Church, he had to do with men who wished to found a new church, and were, in short, radicals rather than liberals. The Superior Council of the Reformed Catholic Church has accepted the resignation, and, having discussed it, ended by passing a series of resolutions condemning it. There are, it says, only three things which can have given him dissatisfaction—the laws for the organization of worship; the principles of the reform movement; or a disposition on the part of priests or people to destroy the basis of Catholicism. As for the laws, they relate only to the secular interests of the church, and Father Hyacinthe voted for them, as a member of the council, and swore to obey them as curé. As to the principles of the reform movement—opposition to Ultramontanism, abolition of sacerdotal celibacy and of auricular confession, and the conduct of worship in the vernacular, which Father Hyacinthe has preached—the Reformed Catholic Church has adopted and holds to them all. If there be any movement against them on the part of clergy or people, Father Hyacinthe, more than any other man, the council says, is responsible for it, but there is no such movement. With this they dismissed his case. In the meantime, he has gone into "retreat" in the mountains. It looks a little as if the Father was somewhat impracticable, if not unstable; timid he undoubtedly is.

In France there is nothing new. The Permanent Committee, which sits as lieutenant of the Assembly, hauls the Ministry over the coals about administrative details. Some members protest against certain suppressions of newspapers; others against certain arbitrary arrests; others against the recognition of Spain, and some keep a sharp lookout on the Bonapartist speeches and circulars. The election in Normandy, on which we have commented elsewhere, has greatly stimulated the activity of the Imperialists, and another election, which is fixed for the 13th inst., in the Department of Maine-et-Loire, is looked forward to with great interest. The *Univers* has been suspended for attacking Serrano, and in fact the press appears to have been rarely in hotter water.

The Government of Spain has been recognized by the great powers, which has given an amount of satisfaction at Madrid of which it is difficult for outsiders to see the reason. But the fact is that the non-recognition gave great encouragement to the Carlists, who were thus able to treat themselves as standing on an equal footing before the world with Serrano's Government, and apparently somewhat shook the confidence of the Madrid people in themselves. At all events, there has been within the last week or two a considerable revival in the activity of the operations against the Carlists, but as yet with no important results. The general muddle which followed Marshal Concha's defeat brought about a change of ministry, the only important feature of which is that it will probably send Moriones into the field again against the Carlists in place of Zabala. Puigcerda, which the Carlists have been besieging, has been relieved, and they are entrenching themselves once more about Bilbao. The French Government has at last taken vigorous measures to close the frontier to Carlist supplies.

AN "OFF-YEAR" IN NEW YORK.

IT sometimes seems as if the citizens of the United States had come to the disheartening conclusion that only once in about four years, when a President is to be elected, can popular feeling or belief have the slightest chance of influencing any nominating convention; and as if, as a consequence of this conclusion, they had made up their minds that during the intervening years they might as well let politics take care of themselves; let the politicians nominate with a view to their own convenience; let the platforms be drawn up with a single eye to the same object; and let the result of the vote be determined very much by the state of the weather on the day of election. Certainly, the four millions of innocent people whose votes in November will decide whether the State of New York is to be a Republican or Democratic State for the next year or so have probably, at the present moment, no very definite idea of what work their leaders are now engaged in; indeed, we may go further than this, and say that if they want to know they will find it extremely difficult to get any information. Beyond the fact that the Republicans have decided to renominate General Dix (supposing this to be a settled fact), we at least do not know that any one thing is determined upon. This certainly does not come from the unimportance of the election this autumn, either in the number of the candidates or what used to be called the dignity of the offices; there are no less than fifty-nine offices of all sorts to be filled, and of these two are judicial offices with large salaries; a governor is to be elected, a mayor for the largest city in the United States, and half-a-dozen members of Congress are to be chosen; and as there are three nominating conventions to be held, we may have in the field one hundred and seventy-seven candidates all told.

But, although it is difficult to gain any precise or accurate information about the movements or intentions of the political leaders, it is by no means difficult to get information and rumors which by their amount and variety make up for any other defects. Giving up all hope of accuracy, therefore, we will state the case as impartial rumor has it.

The next Legislature of this State will have to elect a senator to succeed Mr. Fenton, and as there is great doubt about the relative strength of the Republicans and Democrats, the main question which the politicians are at present considering is not, as the public foolishly suppose, who is to be governor, or mayor, or judge of the Court of Appeals, or even who are to be Congressmen, but how they can arrange matters so as to control this election of senator. To do this, it is necessary for the Conklingites to "fix things" in the Assembly districts, and this they could do but for one obstacle. There are in the world not only Conklingites but Fentonites, and Fenton, it should never be forgotten, is one of the leaders of the Liberal Republican party in New York—a party which, though it does not control many thousand votes, always holds conventions, and furnishes a very convenient base for fierce attacks upon the regular Republicans. The Liberals, indeed, hold to the regular party now very much the same relation which has in former years been held by the Young Democracy or the Apollo Hall Democracy to Tammany. They hire halls, make speeches, distribute documents, threaten awful exposures, insist on purity and reform, and so put their leaders into a position very convenient for making bargains with the enemy. This, it is now rumored, is exactly the use which the sagacious Fenton has made of the Greeley movement of 1872, and he, it is said, is now throwing out hints that he may, by means easily guessed at, make the majorities of the Republicans in the districts very small—so small, indeed, in some as to throw a large number into the hands of the Democrats, and thus prevent the election of a Republican senator. The Liberals hold their convention this week; and, whatever the convention may do, it is believed by the Conklingites that under cover of it Fenton is playing a double game—not that this is looked upon as at all to his discredit, but that it renders it necessary that he should be watched with care. This watching already, it is said, has revealed such a labyrinth of astute Fentonian plots, that the true and steadfast Republicans have been led by them to contemplate seriously the question whether it would not be better for them to allow Mr. Fenton to be his own successor in the Senate rather than run the risk of a Democrat being elected—a view of the situation which is not wholly unsatisfactory to Mr. Fenton, inasmuch as such a termination of the struggle may be regarded as a sort of crowning of the edifice, or the perfection, by the return of the prodigal senator to the fold, of the harmony and discipline which was once the boast of the great party. Feeling that Fenton had the key of the position, the Conklingites some time since, it is said, let him know that, in view of past and the hope of future services, much might be forgiven, and that if he would desert the Liberals he should not himself be left in the lurch, but should be elected senator. To this Fenton is said to have replied, that he had no doubt either of the benevolence or the patriotism of those who made the offer, but that, owing to the force of precedents in such cases, he should feel it his duty to insist that certain guarantees of good faith should be given—meaning, it is believed, that certain offices in the Custom-house should be handed over to him. So the matter stands at present; and this week the Liberals meet at Albany. It is said, on the one hand, that if Fenton appears there taking an active part publicly or half-publicly, assuring the people that the time is full of danger, that the civil service is corrupt, the system of protection destroying our industries, and that the cry of the hour is "decentralization and down with Grantism," it will mean that these guarantees are refused; while, on the other hand, if he does not appear as one of the prime movers at Albany, and declines to let the weight of his name go to the aid of the Liberals, it will mean that mature consideration has convinced him that the peril of the country is past, that the civil-service reform instituted by the President promises beneficent results at no distant day, that the delusions of free-trade have taken no hold upon the national mind, and that the duty of the hour is to beat down sham Democracy.

Such is the aspect of political affairs in the most important State of the Union, as it is gathered from the politicians by newspaper reporters. We do not vouch for every word of it, and every word of it would be denied by every prominent actor. But the general picture given is no doubt correct. Bargains within bargains, lies within lies, all turning much more on Washington than on local politics, is the sum and substance of it.

The Democrats have not absolutely decided upon their policy either. The best men among them wish to have Mr. Tilden nominated, and his nomination would unquestionably be the strongest that could be made. But there are influences at work against him, and, whatever the fact may be, it is openly maintained that these influences are in reality—Tweed; that "Tweed from his felon's cell has reached forth an arm" with which he is making terrible play among the politicians; that the politicians who feel the "current from Blackwell's Island" are immediately observed to lose all interest in Mr. Tilden; and, finally, it is even insinuated that if Mr. Tilden is not nominated, but one of the judges of the Court of Appeals is, it will be because this judge was ill on a recent important occasion when the Ring cases came up in the Court, or, to put the matter plainly, because he is "controlled" by the arm reaching forth as we have said. That Tweed is still in politics there is no more doubt than that he is on Blackwell's Island.

If we turn to the city, the condition of affairs is much the same, except that here politics are so small and politicians are so numerous, that even the newspaper reporter does not undertake to make predictions. There are certain things, however, well known. We are now at the fourth year of Reform, and the politicians whom the movement against Tweed brought to the head of affairs have had an opportunity of showing what stuff is in them. Of these, the mayor is under what is equivalent to indictment, and if it were not that he has only three months to serve, it would be more loudly demanded that he should be removed. In the Police Department, which is perhaps the most important bureau in the city, there have been a succession of scandalous appointments, either made by the mayor, or forced upon him by the Reformers at Albany, which have

all ended in a still more scandalous manner than they began, with public confidence both in the indicted commissioners and the mayor absolutely destroyed. The investigation into the affairs of the Commissioners of Charities and Correction shows that these reformers have been systematically falsifying their accounts; while the Comptroller has been obliged, in order to keep himself in office at all, to engage in "lobbying," and has thus exposed himself also to the dangers of indictment; and, to crown the whole, one of the most prominent Reformers now before the public, and loudly demanding recognition, who has managed to survive the wreck of so many reputations, is no other than Mr. Van Nort, who was a legacy to the city of Tweed himself, put in office at Tweed's request, as a condition of his going out.

Looking about us for some good and beneficent results of the Reform movement, which, though we have forgotten it, did enlist our sympathies only a short time ago so warmly—something that is higher and finer than the mere fact that we are not any longer governed by professed thieves and murderers—we certainly find it, if anywhere, in the fact that the rascally politicians who manage the State have been fairly compelled by sheer force of public sentiment, and a sense of decency in others if not in themselves, to keep at the head of the State government a man of the high reputation and unblemished integrity of General Dix. It is said that this year the same feeling will compel his renomination, and may so even put him in a prominent position as a candidate for the Presidency. We should be glad to believe it true. General Dix belongs to that very class in America which is from time to time exhorted by the politicians to take part in politics, and assured that they are the kind that the people are anxious to elect, if they will only show themselves—men of education, property, character, and position, who not merely would hesitate to do any dirty political action, but would feel themselves insulted at the supposition that they could be capable of it. Our present governor has during the past two years been rendering the community a very valuable service. He has not performed the duties of his office so as to curry favor with anybody. He has decided all questions in an honest, straightforward, and manly way, and without any reference to the next election. No one has attempted, we believe, to deny this. But at this moment his enemies are attempting to ruin the well-earned esteem in which he is held throughout the State, first, by reviving an old and lifeless story about his connection with the Crédit Mobilier, and then (he having shown by the production of his own letters and telegrams that he was always ready to explain his relation to the Crédit Mobilier at the proper time) by insisting upon it that his letters are fabricated. There is no redress; libel is obsolete; the public has an appetite for scandal, and the press must discuss "charges," for in politics nowadays there is little else to discuss.

As we have said, the possibility of re-electing General Dix is the only gratifying prospect now before us. This possibility is about the only chance of influencing politics in the direction of reform which the voter in this State has before him this fall. Any one with whom our advice has weight, we advise that it is his duty to go to the polls if he has an opportunity and vote for Dix, whose career, and whose career alone, gives a contradiction to the cynical generalization lately made, that "inasmuch as all participation in the correction of public abuses is fatal to any candidate for popular favor," the nominating conventions will do well to drop from their slates any man who has distinguished himself as a reformer.

AFFAIRS IN FRANCE.

THE latest election in France, that of Calvados, the principal department of Normandy, has resulted in another and very significant Bonapartist triumph. Out of 77,286 votes cast, the Bonapartist candidate, M. de Launay, received 40,794; M. Aubert, the Republican, 27,272; and M. de Fontelle, the Monarchist, only 8,978. Two years ago, there was another election in the same department, at which 63,000 votes were cast. Of these the Republican candidate got 28,000; the Legitimist, 17,000; the Orleanist, 15,000; and the Bonapartist only 3,000. The Legitimist has now lost half his support, the Republican has not quite held his own, and the Orleanists and the new voters have apparently gone over to the Bonapartist, who stood at the bottom of the list. In 1871, the same department sent up eight deputies to the Assembly, of whom five were Monarchists and the remainder Conservative Republicans. The Bonapartists did not show their faces. If these elections indicate anything as to the course run by French opinion, what they mean is this: that immediately after the war, in the richest and most intelligent department, the people were divided pretty equally between Monarchy and Moderate Republicanism; that, after the failure of the Comte de Chambord, the adherents of the Monarchy split between Legitimacy and Orleanism, but the Republic nearly kept pace with these two forms of faith; and that, after two years' trial of the present provisional régime, the majority have gone back to Bonapartism as the kind of government which they think, after much experiment, will suit them best; and that the probabilities are that the next Assembly, if elected now, would contain either a Bonapartist majority or a powerful Bonapartist minority, full of the insolence of approaching triumph.

Now, if this description of the situation is correct, it strikingly confirms the view we have several times of late maintained in these columns, that the French people are not strongly attached to any particular form of government, or, in other words, have no political convictions or traditions, and that each system which is set up at Paris appears to the country people in the attitude of a candidate for permanent power, with just as good a right to the place as any other if it can show itself worthy of it by capacity and determination in getting hold of it. Divine right they will not hear of, either in the Republic or the Monarchy, and they will not hear of feudalism or ecclesiasticism, or anything which savors of the old régime; but about everything else they are perfectly impartial. The notion so prevalent among Liberal journalists here and in England, that Frenchmen must be longing for a republic in their secret hearts, is the product of the not uncommon error of overlooking the influence which habits and traditions have in the formation of political opinions. Nine out of ten men that one meets in the street, or at a public meeting, even the most thoughtful and intelligent, if asked how they come by the political opinions which they hold, would answer unhesitatingly, that while, of course, their being born under their own government had something to do with their attachment to it, the main cause was their experience of its benefits, and their deliberate comparison of it with that of other countries. From this hallucination flows quite naturally the belief that other people select their form of government in the same careful and deliberate manner, and that they must therefore, as rational men, prefer a republic to any other. The fact is that three-fourths of people's liking for any tolerable government is inherited, or is the result of habit and association, and only about one-fourth that of a process of ratiocination—a fact on which many observers base the belief, that as an absolute monarchy has never been converted at one stroke into a republic, it never will be, inasmuch as it does not prepare people for a republic. Now, Frenchmen not only do not go through any such process, but they have at present no traditions which incline them to one form of government more than another. They *are* attached to their administrative and judicial systems, but do not care particularly who it is that turns the crank in Paris, provided he is a strong man, and will keep the crank turning the same way. Accordingly, having tried a Gambetta Republic, a Thiers Republic, and a Septennat, with a Monarchical Assembly, they are calmly preparing to go back to the despised Bonapartists.

The Paris papers are busy discussing how this state of things should have come to pass, and there does not seem to be much difference of opinion among them. The Gambetta Republic was discredited by the excesses of the Commune; the Legitimist Monarchy by the follies of the King; and now the Assembly and its Septennat are discredited by their failure to provide France with a permanent

government. Marshal MacMahon in the meantime seems to be in no way disturbed by the agitation around him. He has announced that no election, vote, or manifestation will shorten his tenure of office by one day, and it is curious to see how even this small instalment of security and permanency rallies the country to him, and how the candidates for the Assembly are obliged, whatever their other predilections may be, to give in their adhesion to the Septennat. Even the successful Bonapartist in Calvados felt compelled to proclaim his acquiescence in the postponement of the restoration of his favorite régime until the close of the Marshal's term, and the Marshal has been making a tour in Brittany, the very hotbed of Legitimism, in which he has been received with precisely the same flattery, and the same expressions of unbounded confidence in him as the safeguard of society, which used to greet Napoleon III. during similar progresses. The legislature has already passed into a subordinate if not despised position, and the next general election will take place once more under the shadow of the "one-man power." In other words, the peasants will send up deputies, not as the depositaries of the national sovereignty charged with the duty of providing France with a government, but as persons whom the "chief of the state" wishes to aid him. What will be the issue of all this more clearly than ever depends on MacMahon himself. He may make the Septennat the germ of a constitution, or merely a temporary barrier against revolutionary disorder. If he lives and, while exerting a fair amount of influence, refrains from too much interference with the expression of public opinion or the action of the Assembly, he will probably bring about two important results. In the first place, he will give the French people their first experience of the creation of a government by orderly debate and deliberation and the peaceful friction of parties and opinions. The delays and bickerings and dissensions of the last four years have been, in fact, an educational process of the highest value, and such as the French have never had. Through them all the people are finding out what their mind is about governmental questions, and are learning that it is really in their power to exert an influence more or less decisive in the formation of the constitution. All these elections which we are now witnessing have, in fact, a gravity which no French elections have ever had since 1789, because they place seriously and *bonâ fide* before the voter the question whether he prefers a republic or a monarchy, and, if the latter, what kind of monarchy. Hitherto, when he has been consulted on questions of this sort, his casting his ballot has been a mere form, for he was asked simply to ratify what had been accomplished by violence in Paris, well knowing that it made no substantial difference whether he was vexed or pleased. This is an immense gain. Any government created in this way must be a boon for France.

In the second place, the Marshal's course thus far makes it probable that, in any constitution that is framed, his relations with the Assembly will furnish the model for the rights and duties of the executive. If there is anything clear in French politics, it is that a "chief of the state" elected by the popular vote and commanding the army is sure to be dangerous. All French traditions, both civil and military, lead him to consider himself neither the servant nor colleague of the legislature, but its superior, and lead the people to sanction or encourage his pretensions to independence. The legislature is as yet a power which has not secured a foothold in French political traditions or habits. The people have had no experience of a body like the British Parliament or our Congress. All the imitations of it they have known have been sham or contemptible, and have been finally dispersed by mobs or by the army. The "man on horseback" is the only representative of the national sovereignty with which they are familiar, and which they look on as real. To break up this tradition, and make a deliberative body respected as the sole source of authority, and the only safe guardian of the national interests, would be another long step in French political education. Nothing could well help to bring this about more effectively than the practice of having the executive officer chosen by and removable by the Assembly, either after a fixed term or at pleasure. Unless, therefore, the making of a constitution is postponed for seven years, which is very unlikely, the present mode of selecting the president will probably be adopted; in fact, as the Marshal will not budge until his term has expired, it will probably *have* to be adopted, in order to get the new régime into working order before he goes out, and thus prevent a convulsion when he does go. Every one must see how desirable it is that the person who succeeds him should be his regular successor, chosen by the same process to the discharge of the same functions, and not a new officer, emanating from a different source and exercising a different species of authority.

Should the experiment of a Marshalate or Septennat prove successful in France, it is not unreasonable to suppose that it will become the means of transforming other Continental states from broken-down monarchies into conservative republics as their time comes. What is passing in Spain seems to give color to this expectation, dismal as the political outlook is in that country; but it has to be borne in mind that France enjoys an enormous advantage over Spain, in the trial of any such experiment, in the possession of an army which, with all its faults, has never lost its discipline or the habit of subordination to the Government, and whose military traditions are sufficient to preserve its self-respect and make it content with purely military functions. It has once overturned the civil government at the command of its general, but when it did so the state was on the verge of anarchy. During all other French revolutions it has been either a silent spectator or an obedient servant of the *de-facto* ruler. Louis Napoleon, when he made the *coup d'état*, was, in most French eyes, more nearly the seat of the sovereignty than anybody else, and the army at least might be excused for not perceiving the full extent of his usurpation. French generals have never caught the habit of pronunciamientos, and, in fact, soldiers rarely begin to turn to politics for occupation until the weakness of the state has made the army useless for purposes of offence or defence, and converted it into a sort of clumsy and corrupt police.

THE SWITZERLAND OF HOTEL-KEEPERS AND TOURISTS.

BASLE, August 25, 1874.

ONE of the most charming letters of Paul Louis Courier begins with these words, "Make haste and see Italy"; and he then describes the state of abandonment of many Italian churches and palaces, and ends, in the face of so many ruins, with the exclamation, "Lugete, Veneres Cupidinesque!" After a few weeks of travelling in Switzerland, I would almost exclaim also, "Make haste and see Switzerland"; for civilization is invading the country of Wilhelm Tell with an alarming rapidity. I remember climbing the Rigi twenty years ago, when it was a lonely and solemn mountain, by a romantic pathway among the pines. Now you can take a return ticket from Lucerne, and you go up the majestic slopes in a railway carriage. There are stations before great hotels, where hundreds of travellers are staying; instead of peasants, of shepherds, you see nothing but Englishmen with bandannas on their hats, muscular young ladies with ornamental Alpenstocks, Americans with the same hats which they wore a few days before at Paris on the boulevards. The Rigi-Kulm appears at times like the race-course on the Derby Day; you see before you the great Swiss plain, but your imagination covers it at once with innumerable hotels and *pensions*, in which the struggle for life has assumed a new form—the struggle of the tired and hungry traveller with the rapacious landlord. I met one of my friends at Lucerne, who said to me: "I have made a discovery: there is in Berne a vast reservoir of sauce, and when dinner-time comes it is pumped by hidden pipes all over Switzerland, into all hotels, to the top of all the mountains. It is always the same sauce; you will find it everywhere; it covers a multitude of sins; it has the same price everywhere." I could not help laughing at this denunciation of the Swiss hotels, and I remembered that before the time of the huge palaces in which you are now received and sent to some fourth story, there were small inns, with affable landlords and smiling maids and real milk. Switzerland has become more prosaic; it is a disagreeable sensation, when you are coming from some distant glacier, to enter a dining-room where silk gowns are rustling, to hear after dinner, instead of the distant cow-bells, the sound of the billiard-table. You can no longer escape this horrid civilization, and the *Times* and the *Daily News;* Reuter's telegrams will follow you to Zermatt and Chamouni. The mountaineers themselves are getting insufferable; they ask for champagne, and

speak of the Wetterhorn or the Weisshorn as they would of Richmond Hill. Young English ladies ascend the highest peaks, and keep a list of their big ascents as they would keep a list of dances in a ball-room. Enthusiasm is a thing unknown in the Alps; the only ambition of the mountaineers is to find what they call a new pass—to go up one valley and go down another; this new pass is absolutely of no use; they spend ten, twelve, sometimes sixteen hours, like senseless machines, blindly obeying guides who tell them at times where to place their feet; the guides are in reality the men who do all the work and solve all the difficulties; the object of these modern travellers is attained, however, if they have cut their way between two *horns* where nobody went before. It is very amusing to read in the books of Zinal, Zermatt, Saas, and the other places which are the centres of the difficult ascents, in the descriptions given by the Alpine Club members, the perpetual remark: "To my knowledge, nobody ever attempted this pass before."

I hope I am not influenced by an invidious spirit when I make such a criticism, as I have myself made some difficult ascents; but the institution of the Alpine Club, with all its advantages, has certainly helped to multiply the number of unnecessary expeditions. There are now two classes of travellers in the Alps—those who are like eagles, and who always move in the region of snow, who jump, as it were, from peak to peak, as if they had seven-league boots; and those (and the number of the latter is legion) who go from hotel to hotel in the lower altitudes. I confess that I myself always fly as much as I can above the latter; but, alas! they are making progress, and you find them higher year after year. It was my good fortune last year to find myself all alone with a companion three nights in succession in small inns in the neighborhood of Zinal; but this year I found a new and almost magnificent hotel, built in that romantic village called Mürren, which is the centre of a gigantic circle of glaciers and peaks, opposite the Jungfrau, the Eiger, and the Mönch. I was coming down the Schilthorn, and was feeling the delightful fatigue of a long day's work, when a young German with gold spectacles played long parts of "Lohengrin" on the piano in the room to which I had retired before going to bed; and after his performances an American went to him, and, in the name of a committee of ladies, offered him the thanks of the company. Fancy a committee of ladies at Mürren! On the small terrace of the Bel Alp or of the Aegischhorn, when night comes, you see it, as it were, come from under your feet; the valleys are already dark when the giant mountains of the Valais are still visible under the refracted rays of the sun. When they themselves disappear, one could not help feeling a strange sense of gloom and desolation if the voice of ladies did not enliven the solitude till nearly midnight. Go where you will, you cannot escape the tourist. There are travelling chaplains, who go from mountain to mountain and read the holy service on Sunday in the dining-room among the Alpenstocks, the collection of photographs, and the plates. When Sunday is over, these missionaries change their dress, and you will meet them the next day trying a new pass. I found one this year at Macugnaga, at the foot of Monte Rosa, reading the service all to himself in the small inn of that lovely place. He had prepared three rows of chairs, but there was no Englishman there, and the Italians had politely abandoned the room. This excellent man was travelling with a collection of tracts, as he belonged to the Low Church, and he left a few behind him in the Italian language, which are probably still among the volumes of Tauchnitz which form the library of most Alpine hotels.

Happy are the Swiss between France and Germany! Their neutrality is still respected; their little army costs them next to nothing, though I am assured that it would be very effective in a war. Thousands of travellers come every year, and there is a regular inundation of gold in the country as soon as the month of August returns. The net profit of the country must be enormous, judging by the number of new houses which are built every year, by the increasing wealth, not only of the towns, but of the smallest villages. Where you once saw the classic *châlets*, built of wood, with stones on the roof, you now see elegant houses. The valley of Interlaken has become like the decorations of an opera. Locomotives run between the Lake of Brienz and the Lake of Thun; they will soon go up the Lauterbrunnen and over the Brunig pass. At the cascade of the Giessbach, which I remember as so lonely, an immense hotel has lately sprung up, and it owes its success not only to the scenery, but to the regular illumination of the cascades every night, and to the appearance, in the midst of Bengal lights, on a wooden bridge, of a sham-savage, dressed like a Red Indian, with eagle plumes on his head and an axe in his hand. This *sauvage* makes, I hear, a thousand dollars a year by selling his photographs, and becomes in the daytime a respectable, ever-drinking and ever-smoking Swiss citizen.

You may say as a rule that wherever there is an easily accessible cascade the population become quite demoralized. At the Staubbach, for instance, near Lauterbrunnen, you are not yet prevented from looking at the cascade, but if you wish to approach near enough to see the rainbow, you will find a wooden barrier, a small door, and a young speculator who will ask for twenty sous. I crossed the Splügen this year, and my coachman stopped at a point of the road, saying to me: "If you go a few steps from the road, you will have a perfect view of the cascade." I had already had this cascade before me for half an hour. I consented; I had my perfect view, and was fined for it. On every road somewhat frequented by tourists you will find all varieties of beggary. Here the carriage stops for the echo; here a young girl offers you fruit which is not ripe; a few steps more, there is milk; then strawberries, then flowers; the offer of a bunch of *Edelweiss* is irresistible, as when you have it in your hat you are supposed to have plucked it on the high altitudes where it grows. I am somewhat familiar with all these forms of blackmail; but I discovered one this year which was new to me. I had just arrived at the bridge of the Via Mala, and was discussing with my companion, a Fellow of Cambridge, what might be the depth of the gorge under that famous bridge. "Let us try," said he, "how much we can count till a stone reaches the torrent, and apply the formula of accelerated motion." We looked round for a stone—there was none on the bridge; we went up the road, which is cut in the rock; not a stone was to be found—when suddenly an old woman came to us, and offered us some heavy stones at fifty centimes apiece.

Who would care much, however, for paying these small fines for the pleasure of seeing a country the beauty of which will ever remain unrivalled? And I will add that this demoralization is not yet felt among the guides; they are to this day the same men—truthful, brave, honest. I speak not of course of those guides who are to be found in the towns, and who are really mere couriers, accompanying families to such dangerous places as the Rigi; they show you the books, where you can find all their testimonials: "Franz or Hans has accompanied us to Lucerne, has crossed with us the Brunig (which is done in a diligence) to Interlaken, etc., etc." Then comes a long list of all the virtues of Franz or Hans from the enthusiastic and kind-hearted travellers. The true guides are those whom you engage in the mountains, and who go with you on the glacier, with rope on shoulder or axe in hand. The season for ascents is not long, and such guides have not much time to give to places where the tourists congregate. They are, as a rule, a most remarkable class of men—intelligent, quiet, as prudent as courageous; you can follow them blindly; there is fortunately, in every canton, a tariff which tells you how much you have to pay them for every excursion; they are in consequence never tempted to cheat the traveller; and I must say, having often used their services, that I have never found a more disinterested body of men, willing to do so much for a settled price. There are times, of course, and occasions where their services are invaluable; and there soon springs up between a good guide and yourself a feeling almost of affection. They are the men who preserve in the high altitudes the true character of the mountaineer; as for the Switzerland of hotel-keepers and of tourists, of cascades and sham-savages, it has become very prosaic, and sometimes very ridiculous. But there are spots on the sun, and, after all, the biggest hotels and the largest locomotives cannot much alter the character of most majestic scenery, though they may contribute powerfully to spoil the hours of necessary rest during excursions which once were so delightful and, if I may say so, so harmonious in all their parts.

Correspondence.

THE BOOK TRADE.

To the Editor of the Nation:

Sir: I have not observed that you have as yet taken notice of a matter which possesses no little interest for all lovers of books—the movement now on foot among booksellers to make such change in the mode of transacting business as shall release them from the necessity of selling their wares without a living profit.

It is, of course, the interest of the book-buyer to obtain his supplies of literature at the lowest prices compatible with the free continuance of those supplies; and it is the interest of the public that books, which are the means of diffusing culture, shall not alone be had at reasonable rates, but shall be within easy reach of all. Good books, in fact, should not only be accessible to those who seek them, but ought further to be placed in the way of all who can be tempted to acquire them. It is important, therefore, that the trade of the bookseller should be profitable enough to attract a class of men of sufficient energy and intelligence to push it with at least as much vigor as the selling of dry-goods or groceries. Such collections as are on the shelves of the leading booksellers of Cincinnati and Chicago are of no little public service. In fact, they are more important in some respects than even public

libraries, for experience shows how much the latter are resorted to for ephemeral literature, while books which are worth having, which really enlarge the mind and direct the thoughts of the reader, are apt to be purchased for repeated perusal and reference.

Yet there can be no question that the business of buying and selling books has been for years past steadily becoming less remunerative. Year by year there is less inducement to invest capital and brains in the endeavor to gain a livelihood by carrying on a book-store anywhere save in a few of the larger cities, and even in these the mere distribution of books, as dissociated from their manufacture, seems to be growing less and less remunerative and attractive. In the smaller cities and towns, the bookseller is steadily devoting increased attention to "fancy goods" and neglecting literature, while even in the larger centres the complaint seems to be general that a fair assortment of books yields no adequate return for money and labor invested in it. Nor are these complaints peculiar to this country. In England, the same state of affairs has long been the subject of comment. There the "country trade" is gradually becoming starved out, is compelled to sell without a profit, and attributes its decline to the fierce competition which it experiences from the metropolis.

I have watched with much interest the efforts recently made by the American booksellers to find a remedy for this, first at the Cincinnati meeting last January, and then at the July convention held at Put-in Bay. As far as I can judge, the measures adopted were reasonable, and no well-wisher to literature can help desiring them success, even though a slight increase in the current retail prices should result, for in the long run it is the interest of all that book-stores should be enabled to exist in every town where there are schools and possible readers to be tempted. Yet, after all, is not this a struggling against fate? Do not the improvements in communication and transportation which are the most palpable triumphs of modern practical science, inevitably tend to bring the producer and consumer nearer together and render the middleman superfluous? The tendency, so marked of late years, towards the concentration of business in the hands of those whose superior capital or energy enables them to crush their competitors, has no more powerful adjuvant than the railroads and the telegraph, and these instrumentalities must constantly tend to extinguish the business of intermediaries.

I cannot help thinking, therefore, that modern commerce must sooner or later undergo a change now only dimly foreseen, through the agency of constantly increasing facilities for intercommunication; and, from various causes, books are probably the articles that will earliest feel the approaching revolution. In the first place, every one knows that each copy of a given edition is precisely the same, is worth just as much as and no more than any other copy. For what A. sells at a dollar, therefore, B. cannot ask a dollar and a quarter without being deemed extortionate, though a similar difference in the price of a pound of tea or a yard of broadcloth might be thought justified by a possible difference in quality, and yet the loss of this percentage, through competition, may perhaps bring both A. and B. to bankruptcy. Thus the competition in books is much more direct and inevitable than in any other article of commerce; while at the same time books are so infinite in variety, so uncertain as investments, and so comparatively limited in amount of consumption, that the distinction between wholesale and retail dealings is much less rigidly preserved with them than with sugar, or flour, or brown sheetings.

This, again, is aggravated by the facilities afforded for the transmission of books through the post-office. Whether wisely or foolishly, books as mailable matter have been favored with a very low rate of postage, and thus the consumer can obtain his supplies at first hands at a comparatively trifling cost of transportation, while he knows that what he will get by mail will be precisely the same article which he would obtain from his local bookseller. The ordinary country storekeeper is paid for his trained skill in selecting certain grades of cloth, or coffee, or sugar, but a copy of Motley's 'Barneveld' is the same from whatever source procured. Thus has grown up the system under which the great publishing houses retail their books to distant customers—a system vehemently protested against at Cincinnati, but accepted as inevitable by the Put-in-Bay Convention.

Greatly as the existing evils of the book-trade are to be deplored, they would therefore seem to be unavoidable and incurable. All who recognize the services which the bookseller has rendered and still renders to literature and culture, will watch with interest the effort now making to restore prosperity to the business, but it is to be feared that the attempt is useless. The present condition of the trade is the result of causes which will rather strengthen than become weaker in the future, and it would seem that any relief that may be devised will only prove transitory and deceptive.

BOOKWORM.

September 1, 1874.

ARKANSAS POLITICS.

TO THE EDITOR OF THE NATION:

SIR: In your paper of the 20th instant, there is an editorial upon the Arkansas Congressional Investigating Committee, which from your recognized and known spirit of fairness I am confident would not have been written or published had you not been purposely deceived by some person having an end to accomplish. You say:

"The report of the Arkansas Investigating Committee appointed by Congress at the last session promises to be of a very lively character, though we imagine that the gentlemen of the committee are not going to find it an easy matter to reconcile all the evidence. But judging by what we hear from excellent authority, one committeeman, Mr. Ward, will have less difficulty than his fellow-members in coming to a conclusion; his method of reaching it will, however, call for an explanation. This impartial investigator—who has already expressed his opinion as favorable to the Brooksites, and has been so reported in the public prints—went to Little Rock in company with Dorsey, one of the precious Arkansas senators, was met at the railroad station by Brooks and some Brooksites, was taken to Dorsey's house and there remained during all of his stay in the town, was each morning driven in from there to attend the sessions of the committee, was met there by Judge McClure, formerly Brooks's man on the bench, Clayton, the leader of all this gang, Oliver, and others like them. The statements which these gentlemen imparted to him are supposed to be what Mr. Ward is now retailing to the Northern public as information derived from 'leading Arkansas Republicans.'"

To show that the evidence is "conflicting," and that "the gentlemen of the committee are not going to find it an easy matter to reconcile all the evidence," you quote from the testimony of Mr. Bartlett, given before the committee in Washington, page 149 of the pamphlet containing the evidence, wherein Judge Bartlett says "that the cause of the falling-out of the Republican leaders with Baxter was the latter's opposition to the Railroad Bill brought before the Legislature of 1873."

In the first place, no such bill as Judge Bartlett describes was ever before the Legislature, nor could there have been such a bill, because the condition of affairs on which the Judge predicates his supposed bill *did not exist*. Under what was called the Railroad Aid Law—which was submitted by the Legislature to the people, and almost unanimously voted for by them, the leading Republican and Democratic papers all supporting it—the State agreed to issue *its* bonds to aid in building eight hundred miles of railroads, loaning ten thousand dollars per mile to roads that had received land-grants from the United States, and fifteen thousand dollars per mile to those that had not received any land-grant. These are *State bonds*—the State agreeing to pay the principal and interest to the holders, and looking to the roads for reimbursement. Under this law, bonds to the amount of eleven million of dollars had been awarded to the different roads, and five million two hundred thousand dollars' worth of these bonds had been issued. The bill known as the Railroad Bill, *and which Governor Baxter agreed to sign if passed*, proposed that the State should release the road from any liability (to the State) for the bonds already issued, and receive in lieu thereof stock in the roads to the amount of the bonds issued, and the roads would release the State from its obligation to issue the additional six millions of bonds, and no more of them should be called for.

This shows how little Judge Bartlett knew of what he was endeavoring to tell. It is a mooted question among lawyers who have examined the law whether the State has *any* lien upon the roads to which these bonds were issued, and it is an undenied fact that upon *every* road receiving aid there was a first-mortgage lien, taking precedence of any claim that the State might have. The law provided that whenever ten miles of road were graded and tied it could call for and was entitled to receive the bonds for that distance, and so for every additional ten miles. But Mr. Bartlett's own testimony, under his cross-examination by Clayton and others, shows that he not only knew nothing of the law, but nothing of the cause of the split between Baxter and the Republicans who put him in office. Governor Baxter himself ought to be a good witness on this point, and I enclose you his testimony, when before the Committee, taken by a stenographer from his own utterances. By reading it you will see that Governor Baxter says Senator Clayton never applied to him for bonds, advised him against issuing any more, and opposed the issuance of some that were given by Baxter after he became Governor.

So far as Senator Dorsey is concerned, he resigned the presidency of the Arkansas Central Railroad immediately after his election to the United States Senate, and has never applied for any bonds. Governor Baxter endeavors to tell the cause of his falling-out with Clayton and the Republicans, but his reasons, as given under oath, are so confused and contradictory that no one can fathom them. It is true that Judge McClure quarrelled with Baxter soon after the Legislature of 1873 adjourned, and attacked his course in the *Republican* newspaper, of which he was the editor, waging bitter war upon him in that paper until the 29th of last September, when Senator

Clayton, Lieutenant-Governor Smith, and other leading Republicans, bought Judge McClure's interest in the *Republican* and placed it in accord and supporting Baxter; a day or two after this the Republican State Central Committee issued an address signed by all the members of the Committee (eight) except Judge McClure. After this, as Governor Baxter testifies, he required of Clayton that the resignation of several leading officials should be placed in his hands, as the price of his remaining "in harmony with the Republican party."

Now, sir, I submit that this testimony shows not only that Judge Bartlett was mistaken, to say the least of it, but it also shows another thing The testimony was an "appeal from Philip drunk to Philip sober"—from Baxter as a correspondent to Baxter under oath. In his letter to the New York *Herald* explaining the reasons why Clayton and the other Republican leaders quarrelled with him he said, "because he refused to issue railroad bonds, and to use improper means to carry the State elections." On oath before the committee, he said Clayton never asked him to issue any bonds, and that no Republican ever approached him with improper proposals except Asa Hodges, and for saying this Hodges called him a liar while he was on the stand before the committee. So far as published, there have been no discrepancies "to reconcile" in regard to the main fact before the committee—that is, whether Brooks or Baxter was elected governor; every witness who has sworn to anything of his own knowledge has proven that Brooks was elected, and the array of evidence is incontrovertible.

But what you say of Mr. Ward, a member of the committee, is evidently said without a due examination, and does that gentleman injustice. Mr. Ward did not stay at Senator Dorsey's house, because Senator Dorsey lives in Helena, over a hundred miles from Little Rock. If Mr. Ward has ever expressed an opinion, we have never been lucky enough to find it; an alleged interview with a reporter of the *Inter-Ocean* of Chicago was published in that paper, but Mr. Ward sent a letter to the *Gazette* of this city denying the statements published in that paper, so that that cannot be taken as an expression of his views, and we have seen no other professing to be.

Mr. Ward, when here, seemed to be anxious to arrive at the whole truth in regard to affairs in Arkansas; he went to the room where the committee held its sessions at nine o'clock in the morning, remained until after twelve M., returned at two and a half P.M., and remained until five or six in the afternoon every day. He declined all hospitalities tendered him, and devoted himself laboriously to the business before him. I know nothing of Mr. Ward; but he must be an exceedingly cheap Congressman if his verdict can be influenced, as you seem to indicate, by the fact that he was "driven" to the committee-room every morning in Governor Smith's buggy.

The other member of the committee here with Mr. Ward, the Hon. Milton Sayler of Ohio, occupied rooms at the Metropolitan Hotel prepared for him by a committee of Democrats. He accepted all invitations to eat, *drink*, and ride tendered him; and said *in a saloon* that all the Democrats had to do was "to hurry up the Constitutional Convention, submit the constitution prepared, have their officers installed, and their legislature in session before Congress meet, and then the committee became *functus officio*." And yet no Republican has charged or intimated that the acceptance of these hospitalities has or will influence Mr. Sayler in the report which he has to make upon Arkansas affairs. One thing his advice has done: the Bourbon ring are following it implicitly—their programme being for the convention to adjourn on the 5th of September, the constitution to be submitted to a vote (and all the officers to be elected at the same time) on or about the first of November, the Governor to be installed, and the legislature to be in session by the third or fourth Monday in November.

I hope, in justice to all parties, that you will publish the above.

COSMO.

LITTLE ROCK, ARK., August 28, 1874.

[We print the above for what it is worth, though it smacks of disingenuousness in the passage relating to Mr. Ward and his movements. This gentleman did stay at a house owned by Senator Dorsey, though then occupied by Lieutenant-Governor Smith. He stayed nowhere else, and he "declined all [other] hospitalities tendered him," because he readily consented to the policy of isolation and non-intercourse, which his hosts had an interest in maintaining. In fact, for seeing or hearing anything but what the Brooks party were willing he should see or hear, he might as well have been at Helena as at Dorsey's house on the river bluff a mile out of Little Rock, with "Smith's buggy" for his conveyance to and fro. —ED. NATION.]

Notes.

G. P. PUTNAM'S SONS resume publication of Washington Irving's works, which have for some years past borne the imprint of J. B. Lippincott & Co. Their fall announcements include 'Egypt and Iceland,' by Bayard Taylor, and 'Winter Homes for Invalids,' by Dr. Joseph W. Howe. ——Harper & Bros. announce a 'History of Germany from the Earliest Times,' founded on Müller's.——Henry Holt & Co. will publish Mill's 'Three Essays on Religion'; Sir Henry Maine's 'Early History of Institutions'; W. B. Scott's 'History and Practice of the Fine Arts'; and a translation of Wagner's Autobiography and Essays.——A volume of papers for young men, by President Mark Hopkins, is announced by Dodd & Mead.——In J. B. Ford & Co.'s list we remark 'The Abbé Tigrane, Candidate for the Papacy,' translated by Rev. L. W. Bacon; 'Life and Times of Sir Philip Sidney,' by S. W. Davis; 'The Poetry of Pets,' by Sarah B. Stebbins; 'We and Our Neighbors,' and 'Thoughts for Lent,' by Mrs. H. B. Stowe; and, by the Rev. Edward Beecher, 'History and Opinions of the Scriptural Doctrine of Retribution'—a work to which Lee & Shepard offer a companion volume in 'For Ever Lost,' by Prof. Townsend.——'A Theory of Art,' by Joseph Torrey; a popularly illustrated 'Manual of Mythology,' by A. S. Murray; and cheap editions of Stanley's 'How I Found Livingstone' and Jowett's 'Plato,' are to be issued by Scribner, Armstrong & Co. ——Sheldon & Co. have in press Gen. Custer's *Galaxy* serial, entitled 'Life on the Plains.'——Porter & Coates republish from the *Art Journal* its illustrated articles on 'The Stately Homes of England.'——The tenth and final volume of Bancroft's 'History of the United States,' and 'The Old Régime in Canada,' by Francis Parkman, will shortly be published by Little, Brown & Co.——Wm. F. Gill & Co. reprint 'Modern Christianity a Civilized Heathenism,' by the author of 'Dame Europa's School,' together with Charles Bradlaugh's 'Impeachment of the House of Brunswick.'——Keen, Cooke & Co., Chicago, solicit subscriptions to 'Historical Sketches of the Anti-slavery Movement in the United States,' being the papers read at the Abolitionist reunion held at Chicago in June.——On Monday, the 21st inst., we may expect to read the first number of the projected Administration organ in this city, the daily (morning) *Republic*. The editorial and business staff is an offshoot from the *Times*. Two doubts suggest themselves—whether "the party" can sustain the paper; whether the paper can save "the party."——From Washington we have the prospectus of a new monthly illustrated magazine, the *National*, to be published by J. P. Young & Co. Its list of contributors embraces a few good names, mostly of scientific men, but the literary corps seems decidedly mediocre.——In a pamphlet just published at Berlin, Prof. Steinthal indulges in some "anti-criticism" of Prof. Whitney, written, as a half-sympathizing correspondent of the *Athenæum* says, "in the old and antiquated style of literary warfare."——Persons afflicted with hay-fever (autumnal catarrh), who are disposed to further the scientific investigation of the cause and seat of this troublesome disease, will oblige Dr. George M. Beard, of this city, by applying to him for a circular which he has carefully prepared with fifty-two questions to be answered. His address is 53 West Twenty-third Street.——'"John Paul's" Book,' as we learn from Mr. Webb himself, is to be issued, by subscription, by the American Publishing Co., Hartford. It contains nearly all this humorist's letters to the *Tribune*, besides magazine articles and other matter, and will be illustrated.——Apropos of Robert Clarke & Co.'s collection of Confederate school-books, a friend writes us that he once saw at Columbia a Southern primer, in which the story of the good centurion was told, and this account of him given: "He was a good man and a slaveholder."

—As we write, the paintings confided by the Duc de Montpensier to the trustees of the Museum of Fine Arts in Boston are about arriving in that city. The circumstances of this quite unexampled loan have already been made known to our readers. Concerning the collection, the Boston papers have furnished a detailed account, from which we borrow the following particulars. The pictures are mostly of the Spanish school. There is a Murillo, valued at $100,000, "La Vierge aux Linges"; three pictures by Velasquez, one "long supposed to be a portrait of himself," the other two said to be the original studies of the equestrian portraits of Philip IV. and the Duke d'Olivares at Madrid; five pictures by Zurbaran, of which four represent the Annunciation, the Adoration of the Magi, and the Circumcision, the fifth a praying monk (total valuation, $120,000); a repulsive subject by Ribera, "Cato of Utica tearing out his Entrails"; and a number of other pictures by painters of inferior note. Among the works by non-Spanish artists are mentioned two fine landscapes by Salvator Rosa; "Lions in Repose," by Snyders; an interior by Van Ostade; and several modern paintings, including twenty-two Gospel subjects by Tony Johannot, which have been engraved. Attention is also called to a small portrait, in painted enamel, of

the Constable de Bourbon, who was killed at the siege of Rome in 1527. This is the work of his contemporary, Léonard de Limousin, another specimen of whose art is in the possession of the Museum. As soon as the Montpensier collection can be arranged it will be opened for public exhibition; it is hoped not long after the 15th instant. To the good reasons which one always has for visiting Boston, the trustees of the Art Museum have now added a rare and potent one, sufficient of itself to be the cause of many pilgrimages.

—The death of Professor Jeffries Wyman is a great sorrow and irreparable loss. Had his ambition borne any proportion to his ability, and his powers been seconded by health and strength throughout his productive years, his name and works would have been more widely known and his fame unsurpassed by any comparative anatomist of our day. He was a man of singular modesty and entire truthfulness, of the sweetest temper, the soundest judgment, and the clearest insight, of untiring industry up to the limit of his strength, and of great administrative ability. His published writings, mainly papers in the transactions of scientific societies and journals, and of considerable number, are none of them popular in character or in the least pretentious, but none of them ephemeral in value. They are all solid and implicitly trustworthy contributions to scientific knowledge. Jeffries Wyman was born at Chelmsford, Mass., August 11, 1814. His father was a distinguished physician, as is his surviving brother and classmate. Upon his graduation at Harvard University, in the remarkable class of 1833 (which has given six professors to its alma mater), he himself entered upon the study of medicine, took his medical doctorate in 1837, and then studied for two years in the hospitals and museums of Paris. Upon his return, he accepted the curatorship of the Lowell Institute, and there commenced his career as a teacher by delivering two courses of lectures upon comparative physiology and anatomy, one of which was published. About this time he published the first scientific account and name of the gorilla, from materials supplied by Dr. Savage, in a paper which the eminent foreign anatomist who next had the materials overlooked, but to which he had nothing of importance to add. In 1843, he became professor of anatomy and physiology in the medical school of Hampden-Sidney College, established at Richmond, Va.; in 1847, he was transferred to Cambridge, becoming Hussey professor of comparative anatomy. He fulfilled its duties, and gave his admirable courses of lectures until lately, when failing health obliged him to diminish and at length give up the work of instruction. Wholly unaided, he built up the Museum of Comparative Anatomy, making it for its size one of the best in existence. He was for many years president of the Boston Society of Natural History, and the centre of its scientific life. Upon the foundation, in 1866, of the Peabody Museum of American Archæology and Ethnology, Prof. Wyman was one of the founder's trustees, the one upon whom the building up of the establishment mainly devolved. To this the later years of his valuable life have been chiefly devoted. The seventh annual report, just issued, is his last production; and the already large, very important, and admirably ordered Archæological Museum at Cambridge is a memorial of his talents, ripe judgment, and perseverance under physical infirmity, no less than of the wisdom of its founder. Professor Wyman's life, it is thought, has been for several years prolonged by passing the latter part of every winter in Florida, and of the summer in the mountainous parts of New England. He was just established at his summer resort, apparently in better condition than in some former years, when the news of his sudden decease was received. He died at Bethlehem, N. H., on the 4th inst.

—The fifth number of the *International Review* is of less interest and less ability than any of its predecessors. Its articles are seven in number, one, and a very weak one, being made up of reviews of new books, and the others respectively treating of the condition of the Gulf-State Negroes (Dr. E. T. Winkler, of Georgia); the latest biography of Leonardo da Vinci (Professor G. L. Austin, of Cambridge, Mass.); the moral condition of France at the present moment (E. de Pressensé); the constitution of the sun (Professor C. A. Young, of Dartmouth College); the late Mr. Sumner considered as a lifelong advocate of peace and an active member of the Peace Society (Dr. C. F. Magoun, of Iowa College). The tale of seven articles is completed by a tragedy, as the author calls it, in five blank-verse acts, which is entitled 'Ariston,' and a very remarkable article and tragedy it is. The central action is the restoration to his better self of the hero of the play, who in the first two scenes of the first act is represented as having been so devoted to "the social glass," as the author calls it, as to have become an object of contempt to the street boys of Athens, of solicitude to his friends, and of hatred to his father, Alcander—an Athenian who, by the bye, is high in station and of very tyrannical proclivities. The author of the tragedy being a Jeffersonian Republican, whom both as Jeffersonian and as Prohibitionist Mr. James Parton might grasp by the hand, it may be surmised that the mob-contemning Alcander has meted out to him a peculiar kind of justice by his reformed son and his outraged fellow-citizens. In the third scene of the first act Ariston, the hero—recovered from his infatuation by his mother's walking out one evening to find him, when he was much intoxicated at a friend's house, laying her hand on his shoulder, and so bringing him home—makes a firm resolution of changing his name, departing into strange lands, beginning life anew, and earning a glorious reputation with which to return to Athens to his mother and to the lady of his love. He does so, fulfilling all his resolves. The lady of his love, however, returns with him. She had disguised herself as a page in the Elizabethan manner, and everywhere, in all the chances and changes of his fortune, had been his faithful servitor. As for Ariston's mother, she, missing his presence, went mad as soon as he departed from the city, and, fancying herself the goddess Ceres seeking Proserpine, wandered up and down continually singing lyrical pieces and demanding her lost child. She regains her wits in the last act, when Ariston, crowned as the deliverer of Greece, returns in triumph from a mighty victory over the Persian host, apparently that of Xerxes. As for Ariston, he of course has rehabilitated his reputation, while Ino, the disguised page and true maiden, is wedded to her hero-lover. In short, everything of any consequence ends well and merrily, unless we are to consider the fate of the unnatural, but entirely secondary, Alcander an important exception to the general felicity of this singular "tragedy." That aristocrat's hatred of popular institutions, equalling his hatred for his drunken son, has induced him to offer to betray his country to the barbarian king, and very near he comes to managing it. He is caught in time, however (his son, as Grecian general, keeping a sharp eye on him and intercepting his carrier-pigeons), and poisoning himself he dies in a dungeon—imprecatory, unrepentant, contumacious, and unnatural to the last. To let alone its dulness and feebleness, this work is a strange farrago of unredeemed solecisms of many kinds, and it is expressed in appropriate verse, as thus:

> "Men who shout thy praise intend thy exile."

The logical parts are of much the same quality:

> "Do gods create the vine?
> Then man should sip
> With grateful lip
> Bright gushing tides
> Which heaven provides."

It is a matter of some seriousness when a review making the pretensions of the *International*, and one which well managed might probably be so useful, is given over to productions like this "Ariston." Professor Young's paper on the sun's constitution seems very well adapted for general reading, if we may judge by our own easy perusal of it. Dr. Winkler's account of the negroes of the Gulf States is not altogether disheartening; but it reads like the opinions of a gentleman who had himself so far lost heart in contemplating the negro that he feels like Mrs. Somerville's mother when at sea in a gale—as if the time had come to trust in God, and things were in a pretty bad state. Apparently, Dr. Winkler is an old-fashioned man, who is in the way of hearing of the negroes more ill than good, who also sees in them with his own eyes real evil enough to answer all the purposes of corroborative evidence, and who is seriously despondent, though in a doctor-of-divinity kind of a way. The negro is dreadful, but Providence may perhaps intend that the colored population shall migrate, bearing off into Mexico, Central America, and those parts.

—Dr. C. F. Magoun's *International* article on Mr. Sumner as an advocate of peace deals in the needless superlative in the grammatical as well as in other senses. Thus, the evidence of a gentleman in favor of another gentleman's vast attainments, the cosmopolitan nature of his culture, and so forth, must fall short of the dignity of proof so long as the witness writes "most unique" when "unique" is enough. So, too, it is time for the witness to culture to stand down when he makes "pled" the imperfect indicative of the verb "to plead." It is still necessary to speak of this, because the world in some of its parts is still full of "ripe scholars" who are ever ready to bestow with an open hand any number of generous recommendations and testimonials regarding matters of which in reality they know nothing that justifies them in opening their mouths, or qualifies them for more than imperfectly intelligent listening when competent persons are speaking. Dr. Magoun is an admirer of Mr. Sumner, and he shows in fulness that aspect of his hero's character which more particularly interests him. In doing so, he defends Mr. Sumner against an accusation the truth of which would never have been so widely credited had it not been for the orator's rather arrogant, sweeping way of speech, and that visionary quality of his mind which made him often careless as to the practicability of schemes and notions of whose beauty and goodness he had persuaded himself. His early language about the barbarism of war was, for instance, so strong that a friendly critic, Mr. G. W. Curtis, spoke of it, in his eulogy at Boston, as "overstating its own case"; as exposing the

citizen-soldier "not only to ridicule, but to mortal aversion"; and as ignoring the fact that the military force which the orator derided in the presence of the volunteer companies was itself in the last analysis nothing but the law in execution. In saying this, however, says Dr. Magoun, Mr. Curtis has missed an obvious distinction—a distinction, adds the doctor, which Mr. Curtis would have taken had he been "an accomplished lawyer like his friend the Senator." This distinction lies between force employed for the maintenance of domestic laws, and force, war, employed in a public contest between different nations. The one employment of it Mr. Sumner always thought justifiable; it was the other that he hated, as being a relic of barbarous ages—"without law, above law, beyond law: he ever argued that this should give place to law." We believe this to be true as regards Mr. Sumner's views, though, as we have said, Mr. Sumner's way of speech was, for an honest man's, singularly adapted to accomplish the purpose of the dishonest man's, and to leave his thought misunderstood by plain people. Two or three notable instances of this were afforded in the last two or three years of his life. He was often a violent speaker; he was incapable of measuring the effect of his language, for he was egotistically unsympathetic and impatient of the minds and opinions of others; and he usually seemed incapable of correcting, by limiting it, any thought which had once got hold of him. It may be said that he was usually more anxious to pay out all the line he had than to take intelligent soundings. It is thus that even his friendly critics may easily have found themselves in error as to the length to which he meant practically to carry his peace doctrine; and thus, too, that he was ever ready to deliver orations in denunciation of war as the last resort of nations when as yet there was in existence, as binding upon nations, neither the law which he revered, nor the desired tribunal to settle cases, nor the material power to give force to the decrees of the court. But he was not the mere irrational non-resistant that his violent language, until modified, made him suspected of being. The article, "Leonardo da Vinci and his Works," by Prof. G. L. Austin, suggests that the "Cambridge, Mass.," which follows the writer's name might be misapprehended if understood to mean "of the University at Cambridge, Mass." It is ill-written, and of no value; from the book itself which is the occasion of it a writer ignorant of Leonardo, his times and his works, and of slight literary knack or practice, might with no difficulty have made a far better article. It would be hard to guess what Mr. Austin intended by sentences like this: "Cæsar Borgia—that Cæsar *aut nihil* of his age"; or why a man should write with this profundity about Leonardo at Milan: "One might justly suppose that he was the steward of the household. But no! He did all this with hand, not with heart. He was a courtier to please his master—not himself. No real delight he felt in material feasts; the intellectual feasts gratified him the most." M. de Pressensé's article is mostly trite, but is new in one respect: belonging as he does to that eminently respectable body—the Protestant Church in France—an institution of an entirely assured position, as perfectly well recognized and admitted by everybody as the Sorbonne itself; sheltered, however, from certain responsibilities—M. de Pressensé and its other members can cast a much more comfortable look over disordered France than can most Frenchmen: If, he may say, my countrymen will in spite of everything be clericals or else rationalists; if they will not take the golden mean of reasonable Protestantism—religious, moral, respectable, steady-going, anti-communist—yet wide as the poles asunder from Ultramontanism—why then, it is hardly to be expected that they should have a material prosperity or a religious life free from wild distractions or deep debasement. Meantime, he adds, as for our Protestant Church in France, it has been divided into two parts, the evangelical and the so-called liberal, which in numbers are to each other relatively as twelve is to ten; this has happened very recently—too recently for us to have wholly recovered from it; but it is to be expected that when the synodical evangelical church, which is ours, is well organized again, it will be left free to devote itself with vigor and success to a salutary propagandism, and that France may by-and-by learn from us that her destiny is not to be accomplished either by a religion without liberty or a philosophy without God, etc., etc. It will be seen that M. de Pressensé's is in no respect a position to be lightly treated; just at present, however, the extreme comfortableness of it has most clearly revealed itself to us.

—The text of Prof. Tyndall's address on the development of science does not bear out those of his critics who set him down as an enemy of religion. He appears, rather, as a defender of science in her negative attitude toward religion; and, provided that religion will undertake not to invade the scientific domain and distort facts, he is more than willing that the world should still be religious. Exactly what kind of religion Mr. Tyndall thinks possible among people who believe not merely in the Copernican system but in the evolutionary theories of Mr. Herbert Spencer, and the discoveries of Darwin as to the origin of species, we cannot discover from his address; but the hints thrown out seem to point in the direction of a religion, not of belief, but of imaginative devotion, escaping belief to find a refuge in the contemplation of the eternal mystery of the universe. "Man has never been, and he never will be, satisfied with the operations and products of the understanding alone; hence physical science cannot cover all the demands of his nature," Mr. Tyndall says at the beginning of his lecture; and at the end he declares that he is willing to affirm religion to be a field "for the noblest exercise of what, in contrast with the knowing faculties, may be called the creative faculties of man." His suggestion as to the future of religion is not unlike some remarks more at length by Mr. Herbert Spencer, in one of his papers on sociology, which we noticed some time since, and, indeed, may be taken to represent an opinion very commonly held among a number of well-known scientific men, who recognize the insoluble and impenetrable mystery of existence, and, at the same time, *quâ* men, devote themselves to the soluble and the penetrable.

—Mr. Tyndall avows himself a materialist; but it will be seen from the quotations we have already given how widely his materialism differs from that of the last century. The body of his address is an historical, but necessarily very discursive, review of the development of the enquiry into the nature of things, wrongly begun by our remote and superstitious ancestors, who handed over "the rule and governance of natural phenomena" to supersensual beings, confused from time to time by the metaphysico-religious speculations of later generations, but really set going, and carried forward to its present triumph over prejudice and opposition, by a series of investigators who have resolutely declined to listen to anything but the teaching of human experience of the external world. This historical essay is hardly to be taken as a complete or even completely connected review, but rather as an eloquent picture or series of pictures. Mr. Tyndall regards the beginning of true science as to be found in the speculations of those early philosophers who invented the "pregnant doctrine of atoms and molecules," and most people will be surprised to find that, according to Mr. Tyndall, we are thus carried back (not of course to our old acquaintance, Thales of Miletus, but to Democritus), who believed that nothing existed without its cause, and that all changes came from the combination and separation of molecules. "The great enigma, 'the exquisite adaptation of one part of an organism to another part, and to the conditions of life,' more especially the construction of the human body, Democritus made no attempt to solve." But Empedocles, noticing this gap in the doctrine of Democritus, "struck in with the penetrating thought, linked, however, with some wild speculation, that it lay in the very nature of those combinations which were suited to their ends (in other words, in harmony with their environment) to maintain themselves, while unfit combinations, having no proper habitat, must rapidly disappear. Thus, more than 2,000 years ago, the doctrine of the 'survival of the fittest,' which in our day, not on the basis of vague conjecture, but of positive knowledge, has been raised to such extraordinary significance, had received at all events partial enunciation." After this perhaps over-ingenious connection of Darwinism with the philosophy of Democritus, we have very interesting remarks on the development of the atomic philosophy, and incidental observations of great value, as for instance that describing the test of the truth of physical law furnished by the imagination, or act of mental presentation (*vorstellen, Vorstellung*), *e.g.*, the old explanation of the ascent of water in a pump by the law that "nature abhors a vacuum," is a truth which cannot be presented at all to the mind as a picture, and is in fact no truth at all.

—Perhaps the most interesting part of the address is the imaginary discussion between a disciple of Lucretius and Bishop Butler; the Bishop's position being that "our organized bodies are no more a part of ourselves than any other matter around us," the Lucretian materialist holding of course the exactly opposite opinion. The Lucretian begins by trying the Bishop's position by the test we have just mentioned, and asks whether a mental picture of what are called in the 'Analogy' "living powers," "percipient or perceiving powers," and "ourselves," can be formed apart from the organism through which these are supposed to act. Where is the conscious self? If there is such a thing apart from the body, it must be somewhere, it must have some habitation and form. If so, what form? When a leg is amputated, the body is divided into two parts; is the true self in both of them or in one? You begin at one end of the body, and show that its parts may be removed without prejudice to the perceiving power. What if you begin at the other end, and remove, instead of the leg, the brain? The body, as before, is divided into two parts; but both are now in the same predicament, and neither can be appealed to to prove that the other is foreign matter." The Lucretian wishes to know what is to be said also of the change of the brain from health to disease, and makes use of the electric telegraph to show the falsity of the Bishop's comparison of the organs of the body to

mechanical instruments. The telegraph wires, he says, and our nerves are no doubt similar; but there is this difference between the operator and our percipient selves: cut the wires, demagnetize the needle, break the battery—the operator survives; but if the human battery be broken, what is left? To this the Bishop replies that in the 'Analogy' he did not attempt to prove anything absolutely, but simply to show his "deistical friends" that they were no better off than the Christian. He is willing to go further, however, and discuss the atomic theory with the Lucretian. He admits, in the first place, the existence of molecular forces, and that crystalline forms result from them, but he requests the Lucretian to test his materialist theories by a simple experiment. Take, he says, dead atoms, dead carbon, dead oxygen, dead nitrogen, dead phosphorus, all the other atoms, dead as shot, of which the brain is formed, put them together, and then imagine, by the aid of *Vorstellungskraft*, if you can, how from this death sensation, thought, and emotion are to arise. It cannot be done. The dialogue ends in this admirable way:

"You cannot satisfy the human understanding in its demand for logical continuity between molecular processes and the phenomena of consciousness. This is a rock on which materialism must inevitably split whenever it pretends to be a complete philosophy of life. What is the moral, my Lucretian? You and I are not likely to indulge in ill temper in the discussion of these great topics, where we see so much room for honest differences of opinion. But there are people of less wit or more bigotry (I say it with humility) on both sides, who are ever ready to mingle anger and vituperation with such discussions. There are, for example, writers of note and influence at the present day who are not ashamed to assume the 'deep personal sin' of the great logician to be the cause of his unbelief in a theologic dogma. And there are others who hold that we, who cherish our noble Bible, wrought as it has been into the constitution of our forefathers and by inheritance into us, must necessarily be hypocritical and insincere. Let us disavow and discountenance such people, cherishing the unswerving faith that what is good and true in both our arguments will be preserved for the benefit of humanity, while all that is bad or false will disappear."

—On the 1st of October appears at Leipzig (H. Hartung & Sohn) the first number or volume of what we hope may prove to be a periodical, and if a quarterly, so much the better. We refer to the *Italia*, which Professor Karl Hillebrand will edit from Florence, and which he, if any man, is capable of making entertaining and profitable to readers of all nations. The work is, however, addressed primarily to that part of the German public which takes an interest in Italian affairs, and which is disposed not only to have a statistical knowledge of them, but, as the editor says in his prospectus, to understand them. The history, art, archæology, and landscape of the peninsula the Germans know already, and probably better than the Italians themselves; the inner springs of the national life of the present day are still a mystery and a riddle to the countrymen of Goethe and Winckelmann. That these may now be revealed by the aid of the foremost Italian specialists—savans, statesmen, and littérateurs—is the chief aim of *Italia*. The departments of history and scientific criticism, we are told, will be entrusted to Germans by right of eminent domain. Due account will be taken of the intellectual interaction of the two countries whose political alliance since Custozza, and especially since Sedan, has given assurance of a still closer and deeper intimacy, of which this magazine is a happy token. The second volume will appear on January 1, and the third at the will of Professor Hillebrand's audience if he succeeds in pleasing them. In the forthcoming volume the post of honor is rightly assigned to Professor Ruggero Bonghi, one of the ablest and most versatile of Italian parliamentarians. His topic is a comparison of the Italian and German methods of dealing with the church question. The tenant-system in Tuscany (by Sidney Sonnino); the paper currency (by Carlo Fontanelli); a tourist's impressions of Italy (by A. Gallenga, whose good wine needs no bush); the historical novel since Manzoni (by Prof. Angelo de Gubernatis); notes on Leonardo da Vinci (by Herman Grimm); the French in Sicily, 1674–78 (by O. Hartwig), still further enrich the table of contents, which we have not yet exhausted, for there are translations of Giusti's poetry, and again of German into Italian metres. With literary, dramatic, and political résumés—the last by Professor Hillebrand—and notices of current German literature relating to Italy, the volume closes; and that it is a brilliant "first number" will not be denied. Non-German readers may perhaps regret that the Italian contributions have to be rendered into German.

THE "HESSIAN" MERCENARIES.*

THE much controverted question whether there is anything in the nature of republican institutions to make republics ungrateful will, probably, never be satisfactorily solved. The political philosophers seem to-day as far from the solution of the grave problem as they were two thousand years ago—among other reasons, for the very simple one that the *fact* underlying the question is but an unproved hypothesis. There are, in the history of some of the most famous republics, instances of an uncommon tenacity of what we may call the political memory in contradistinction to the mere historical memory. We simply state the fact without venturing upon an explanation of it.

It will hardly be denied that the part taken by France in the War of Independence is, up to this day, a source of friendly sympathy bestowed by the Americans upon the French people in all their troubles. Time, a better knowledge of the historical facts, and a riper political judgment, have worked together to weaken this sympathy so far that it is impossible to make it ever again a war-cry of parties, as it was in the times of Jefferson and Hamilton. On the other hand, there is still enough left of it to make some editors and politicians deem it sufficiently strong, if properly managed, to get the better of the sober and impartial political judgment of the people. During the late Franco-German war, some of our papers wrote with as much fervor about the disinterested generosity shown by France to the United States during the Revolutionary War as if Lafayette had just taken his leave with a hand-shaking all round. Leading papers of this city considered themselves none too good to vent their inky wrath upon the poor "Hessians," as if the very men who, under Knyphausen, stormed Fort Washington, were then storming the heights of Spichern. It is not astonishing that the Congress of the Confederate States (Feb. 1864) called the German volunteers "legions of Hessian mercenaries." And it was, perhaps, not surprising either to find that in 1870 some editors in the Northern States had a livelier recollection of the 30,000 "Hessians" in the Revolutionary War than of the 200,000 German volunteers in the War of the Rebellion.

One need not belong to the school of political sentimentalists not to shrug one's shoulders over this sympathy for France, though there is now and then something unreasonable, and therefore unhealthy, in it. Honor to the nation that does not quite forget services rendered a hundred years ago. But even the editor of a village weekly should deem the "Hessians" too low a trump ever to be played against the living generation of Germans. To sink the last remnants of bitter feeling against the "Hessians" into the quiet deep of history we would recommend the publication of a translation of Dr. Kapp's 'Soldatenhandel.' It would certainly pay well in every respect. The author is too well known to the American public for us to dwell upon his exhaustive thoroughness, his rigid candor and true historical spirit, and the easy flow of his narrative. It may, however, be necessary to state that the treatise is not only of value to the historian *ex professo*. Any one taking an interest in historical subjects will not regret the time spent in its perusal. The author calls this second and enlarged edition "ein Beitrag zur Kulturgeschichte," and that it certainly is.

To read these pages and to harbor any rancor against the "Hessians" seems impossible. They are not guiltless; nay, their guilt appears almost unfathomable. But it is not they, individually taken, who could, in justice, be made responsible for it. It is the guilt of the whole German nation, whose pitiful representatives they are doomed to be; and not the guilt of the then living generation either, but the guilt of the nation as accumulated in many a century. Not that the "Hessians" felt any pangs of conscience in smiting liberty. Oh, no! "The people had rebelled, therefore they had to be brought to reason by the *ultima ratio regis*—in these few words all the political conceptions of the German officers are contained" (p. 229). "Once, in an unguarded moment, the Hessian General Loos even delights in the 'philosophical pleasure' of being able to tell an ungrateful prince and presumptuous minister: 'I do not want to serve you any longer.' But to the higher view, that this service is a contemptible beadle's service (*Schergendienst*) and incompatible with the self-respect of a free man, these gentlemen cannot and dare not rise" (p. 230). And the officers formed no exception; they thought as the rest of the nation did. "Even if Schiller (in 'Cabale und Liebe') did express the sentiments of a great part of the educated German youth, Germany in general remained indifferent to the forced participation of her sons in the American war. A real political conviction and independent political interests, and in consequence, therefore, political parties, had no existence in Germany before 1789. Even the first minds of the nation hardly knew political questions in the present sense of the term" (p. 203). Goethe, in all his writings, mentions the American war but twice, and then only incidentally. Klopstock and Lessing took hardly a more than superficial interest in it. Only Kant took part very decidedly with the United States against England. The higher classes in general "considered the traffic in soldiers a *regale* of the prince, and did not think it worth while to waste words about it" (p. 207).

All this cannot be excused, but it can be understood. To understand it fully, however, it is necessary to go back to the very beginning of German

* 'Der Soldatenhandel deutscher Fürsten nach Amerika. Ein Bertrag zur Kulturgeschichte des achtzehnten Jahrhunderts von Friedrich Kapp.' Zweite vermehrte und umgearbeitete Auflage. Berlin, 1874. Pp. 239. New York: B. Westermann & Co.

history, and, more particularly, to study the indescribable misery in which the Thirty Years' War left Germany. That is the indispensable background to the fearful picture unrolled in these pages. The Virginian slave-driver, hurrying his manacled gang "down South," might have learned a good deal from the German recruiting officers, stealing and driving to port these "Hessians," who, according to the Prince of Waldeck, "*ne demanderont certainement pas mieux que de trouver l'occasion de se sacrifier pour elle* [*Sa Majesté d'Angleterre*]," p. 244. A few lines from the instructions for corporals transporting recruits will prove the assertion. "If the recruit be in the least doubtful, he must, on command of the corporal, cut his suspenders, cut off the buttons from his pantaloons, and hold the pantaloons up with his hands. If he has made an attempt to escape, he must, without mercy, be chained, or the thumb-screws applied. It is bad if the corporal suffers it to go so far that he has to make use of his musket, and to wound or kill the recruit" (p. 15). It may seem strange that such treatment of the poor devils who longed so ardently to sacrifice themselves for George III. did not arouse a storm of indignation throughout the nation. The explanation is readily found: the rest of the people were not treated any better by these most gracious rulers of countries of vest-pocket size. In Hessia, if the parents of the kidnapped son complained, the father was sent to the iron-works, the mother to the penitentiary (p. 51). In Stuttgart, even, a councillor of the exchequer (*Kammerrath*) was treated by a simple lieutenant to twenty-five "Stockschlaege," well laid on by the soldiers of the guard, for the very good reason that he had not bowed to the officer. The head of the councillor being severely hurt, his life was in danger for several days. The lieutenant, belonging of course to the nobility, was hardly punished at all, for, as the courtiers said, it served the impudent clerk right (p. 99). The Markgrave of Anspach shot a chimney-sweeper from the roof of his castle because his mistress had expressed a wish to see the man tumble. To the widow of the murdered man, who implored mercy, the mild-hearted prince gave five gulden (p. 113). Mistresses were so dear a pleasure that five gulden, more or less, could not be of any consequence. The Landgrave of Hessia had to pay his *maitresse en titre* 10,000 thalers, gold, a year, and she was only the first among many, for he is said to have had over three hundred illegitimate children; his son, the Count of Hanau, had only seventy-four. In other respects, too, the son was unable to attain the towering eminence of his father. Cassel was one of the most beautiful and splendid cities of Germany. The sums expended by the Landgrave in magnificent buildings were enormous; and yet he managed to leave to his heirs 60,000,000 thalers. It was at least a well-paying business, this coining of the flesh and blood of one's subjects. There is certainly no known dealer in black human flesh who could boast of similar results. But even among the German princes, the Landgrave stood on a solitary eminence, principally, it is true, because many of them could not do as they would have liked to do. Karl Eugen of Würtemberg had, as late as 1782, a regiment of cavalry, one hundred and fifty men, of whom not one had a horse. Another prince kept fifty grenadiers as a body-guard, who had to have high heels on their shoes to appear taller. For this company of fifty there were two bearskin helmets; these the sentinels in front of the castle had to wear. Another had three different uniforms for his guard; to-day they were grenadiers, to-morrow cuirassiers, and a third day sharpshooters. Another had some regiments of dragoons on foot. From time to time they had to make cavalry evolutions on foot, and then they were allowed, during the attack, to neigh like horses (pp. 9, 10). Now, these are not fictions of the unbridled imagination of a satirist, but sober history.

There is one light point in the dark picture, auguring a better future. The princes of Hanover, Brunswick, the two Hessias, Waldeck, Anspach, and Anhalt-Zerbst, sold their subjects to George III. to subdue the rebels in America. Frederic II. of Prussia also was not overscrupulous about the manner in which his regiments were completed, but he did not sell them; he found an employment for them not now to be regretted by Germany. And more. There was nothing of that sympathy for the United States in Frederic sometimes ascribed to him by American sentimentalists; but he very heartily despised those on whom the immediate blame for those 30,000 "Hessians" rests. We may be allowed to give, in conclusion, part of a letter of Frederic II. to the Markgrave of Brandenburg-Bayreuth, now for the first time published by Mr. Kapp:

"POTSDAM, ce 24. Octobre, 1777.

"MONSIEUR MON NEVEU! J'avoue à Votre Altesse Serenissime, que Je ne pense jamais à la guerre actuelle en Amérique sans être frappé de l'empressement de quelques princes d'Allemagne, de sacrifier leurs Trouppes à une querelle qui ne les regarde pas. Mon étonnement augmente même quand Je Me rappelle de l'histoire ancienne, cet eloignement sage et général dans Nos Ancêtres, de prodiguer le sang allemand pour la defense des droits etrangers et qui passa même en loi dans le corps Germanique.

"Mais Je M'apperçois que Mon patriotisme M'emporte . . . FÉDÉRIC."

RECENT POETRY.*

II.

A WRITER evidently on terms of acquaintance and perhaps intimacy with Mr. Robert Buchanan has divulged the fact that it is to Mr. Buchanan that we owe the poem 'White Rose and Red,' and not only that, but a preceding poem entitled 'Saint Abe and His Seven Wives.' Both were published anonymously. There seems to our mind to be something of impertinence in a challenge from a writer like Mr. Buchanan which requires of the public that it should examine him anew. Why should we? He might well enough stay quietly in the class assigned him, and prove his right to promotion by good acknowledged work. It is taking a liberty to say in effect to the public that the poet, satisfied that his own estimate of his own powers is of more value than that of the judges, has chosen to change his name and apply under disguise for a new examination. Considerations of this kind do not, however, trouble Mr. Buchanan. All his literary career shows that having had strength of body, mind, and character sufficient to take him safely through the hectic stage of Scottish poetical development, he retains less than sufficient to raise him above a conceit of himself and his works and an ignorance of his incapacities which have often stood his literary countrymen in excellent stead, and which he himself is often displaying in various ways. Beginning his career as a writer in poetry by some sketches suffused, not to say saturated, with that pathos of elemental tragedy which so many a humble life exhibits, he at once gained a distinct success, and by-and-by he repeated it. Ambition growing within him, or rather unfolding itself, and reaching out in more than one direction, he has since constantly made distinct failures—sometimes obvious and sometimes radical but not obvious, first as a London man of letters, and secondly as a philosophic and lyric poet. But, indeed, lest the mention of a want of reach for certain kind of poetry should be misleading, let us say that his happy efforts, in such of the several kinds of poetry as he has attacked, have deserved to be called happy in a general literary sense rather than in a sense very poetical. For one thing, he has never yet mastered his subject; but in the early books—in the description of seduced fisherwomen with their idiot sons, or of David Grays dying of declines under the eyes of their mothers—this subserviency to the common feelings naturally rising from the situation is as fortunate for him as his sentimentalism and indulgence of his emotions are unfortunate for him when he fills a volume with verse such as that contained in his "Book of Orm"—a most tremendous philosophic tragedy of the soul of man, which makes the reader sigh for the old-fashioned five-act tragedy that young Scotchmen took up to London in their portmanteaus a hundred years ago—before the destiny of Mr. Buchanan had begun to trouble Clotho or any of us. Of Mr. Buchanan's course as a general man of letters, a principal waymark is a volume of essays which are very "loud" in tone. This is fair enough description, because, considered as intellectual judgments, the essays were without merit except in occasional flashes, and those infrequent. The late Professor Wilson, who has much to answer for as a corrupter of Scottish literary taste and an encourager of a violently and unallowably self-assertive style of writing, has apparently had his due degree of influence on Mr. Buchanan. But if Professor Wilson could not make it quite pleasant to his readers to tell them all the time that he was more than six feet high; was Kit North; could outjump the Flying Tailor and outbox the Flaming Tinman; admired the 'Excursion' and despised any man who did not admire it, would in fact refuse to drink Glenlivet whiskey with any such "sumph"—if Professor Wilson could not very long beguile us with this sort of writing, followers like Mr. Buchanan, who presumably are no more than five feet and some inches high, move the reader to but very little complacency when they confide to us that Dickens makes them cry, and swear that in their judgment a man who says The Good Genius's pathos is sad stuff is a duffer, or has never felt his soul melt at the note of the lapwing. Another and more exciting of Mr. Buchanan's critical labors was a gallant attempt of his at cleaning out the Swinburnian stable. This resulted in several letters and pamphlets of a noble character, some from Hercules and some from Augeas himself; but the former was much overborne by the contemptuousness and the Greek metres and other acquirements of the latter, and while the world greatly admired the pair of them, and gave full credit to the moral attitude of Mr. Buchanan, there was a general feeling that had he known the things that made for his own good as a literary person he would have unalterably held his tongue.

* 'White Rose and Red. A Love Story.' Boston: J. R. Osgood & Co. 1873.
'Thurid and Other Poems. By G. E. O.' Boston: Lee & Shepard. 1874.
'Satan. A Libretto. By Christopher Pearce Cranch.' Boston: Roberts Brothers. 1874.
'The Poems of Charles Fenno Hoffman. Collected and edited by Edward Fenno Hoffman.' Philadelphia: Porter & Coates. 1873.
'Poems. By Odnt Parkhurst of Iowa.' Chicago: The Western News Company. 1874.

The anonymous work which is Mr. Buchanan's latest poetical production is of no special importance that it should be anonymous and ask us to be curious about it. It is well enough and ill enough, and, except for length, is magazine poetry. It has for its heroine an Indian girl, a maid with moccásons, whom we may reasonably expect transatlantic readers to believe in with a clearer faith than can be given on this side of the water. She loves and is loved by a wandering white hunter, who speedily makes the young thing his wife after the fashion of the forest; but as it was wandering that brought him to her, so he soon is smitten with the desire to wander away again, and he seeks his home in Maine, promising soon to return. The scene of the loves of the hunter and "The Red Rose" is described with such collected wealth of acacias, magnolias, prairies, rattlesnakes, grizzly bears, crocodiles, green serpents like Mr. Joaquin Miller's large ones, and lovely Indian maidens, that as we have hinted we can find in ourselves but a confused and imperfect sympathy with it; but the scene in the Maine village is managed in a way which will not command high praise as a brilliant feat, but which deserves commendation for cleverness. It will recall to the reader the street conversations in 'Saint Abe,' the dialogue of which poem was to the purpose, lively and well, though not subtly, discriminated, and expressed in a fluent sort of verse whose ease often degenerated into the slipshod, but always was at all events easy and fluent, and if often vulgar and trivial, often appropriately so. The same general praise and blame are to be given to the versification of 'White Rose and Red.' Mr. Buchanan has evidently sought lightness of movement and has in a creditable measure attained it. The errant lover of course finds it possible to fall in love with a Maine girl, "The White Rose," who reminds him of the other by contrast, and the story closes with the death of the Indian wife at the long-sought home of her husband and her successful rival.

The author of 'Thurid,' "G. E. O.," is a writer the secret of whose initials we do not know. Of the three tales which the volume contains we have read two without being repelled from reading the other and without being attracted towards it. It was once a common saying in discussing the poems of young writers, that a superfluity of heat and of consequent tropicality of expression were good signs in the beginner; increasing years and awakening judgment being held competent to cool the ardor of the most glowing, but not capable of inflaming the cold and sterile. Such comments might just now seem to have a false sound. It has for many recent years been rather our habit to believe that a poet need not be a hard-working man at all, and that, if he has the true poetic fibre in him, poetry will come spontaneously out of him if the west wind blows on him or Shelley's cloud strikes him properly. The result of this judicious doctrine has been that the spontaneous school, with its plenitude of feeling and its economy of labor and of taciturnity, begins to cause a doubt in some minds whether, for the modern young poet, a tendency to verbal and mental baldness, and a disposition to mind his book and let the west wind alone, may not be a thing to be desired. Among "G. E. O.'s" qualities a deliberate simplicity of manner may be named. We do not see, either, that it is not truly enough "G. E. O.'s" natural way of speech. "Thurid," the poem which gives its name to the book, is not so deserving of these remarks as "Goodman John." The simple manner does not so well suit the former legend as the more heroic—the warp of the song being a well-known passion and resultant miseries of a kind familiar to all.

There can be no doubt that our time has to a very great extent discarded anything like a real faith in the existence of a devil, personal or impersonal. This, at any rate, is true of the belief of Americans. We have heard on good authority that American penitents composing their "meditations', during Roman Catholic "retreats," fail as a rule in making good meditations on the subject of hell. Probably it is not too far-fetched an inference that they thus fail because, whatever may be the condition of their own hearts and minds, they have been at least brought up under the million influences of a community which as unwillingly believes in a hell or a devil as in any other means, ministers, or symbols of restraint. De Tocqueville would probably find no difficulty in discovering both the bad and the good roots of this incapacity in our democratic system—or as some would say, in the various inherent conditions, political or what not, under which American life is carried on. Indeed, to assert this of American opinion on the topic named is to assert it in a degree of all modern civilized opinion, and we need not confine our remark to this country. Mr. Cranch speaks of his 'Satan' as "a libretto." "A libretto," he says, "is too often a mere thread on which the composer strings his pearls—a text for some work of art nobler than itself. While this poem makes no claim to be full-strung, it may perhaps serve to awaken a few snatches of a music containing some vital symbolic conception of the grandest of all harmonies—the Divine order in creation." As we understand this passage, real music, palpable to the sense, is not meant. The "libretto" is metaphorically a libretto, and the music which it is to awaken, a metaphorical music in the soul of the listener. We may say that Mr. Cranch describes for us a sort of Unitarian Satan, so to speak. He is a being whom we confess we have found very vaporous. The gist of it all is this thought: that Satan stands as the representative of all evil; but evil is good in the making, and in the end it will come out all right. Whatever this may be as theology, it will be seen that no one could make poetry out of it. Such naked dealings with what is after all the main question that occupies the mind of man, not even the Muses themselves would venture upon, and the problem as thus set forth is seen to be no business for the poet.

Mr. Charles Fenno Hoffman's nephew has piously collected all the songs and other poems of his uncle, so long sequestered from the world, and has published them in a good-looking duodecimo volume. The author has a neglected but not yet crumbled niche in the gallery of American literature, and it was well to gather his works together and let them together await posterity and the cicerone of the cyclopædias. We may be sure that these anacreontics here will sadden but few of our children—will reach a company small indeed in comparison with the fair women and brave men who listened to "Sparkling and Bright" a generation and more ago; yet it is a good deed to save them. The verses certainly are now touched with a yellowing melancholy, and a safer recipe for a winter evening of pensiveness could hardly be found for gentlemen past fifty than a resolve to reperuse their Hoffman when January is almost gone.

In almost every band of contemporary poets there is one who is abandoned to despair. Mr. Clint Parkhurst is, so to speak, actively abandoned, and has something of the look of a desperado. On page 79 he speaks of "creeds" in an epigram:

> "All human vagaries deceive,
> The best of creeds is—disbelieve."

Mr. Parkhurst's pronunciation and other literary accomplishments suffer by his youth's having been partly taken up with service in the war against the rebellion, and must not be reviewed harshly. On another page (44) we find the poem, "There is no Good," which begins thus:

> "Earth seems a hell.
> Life came unasked
> And so comes woe.
>
> . . . . . .
>
> I denounce existing things,
> There is no guiding hand."

This writer has, however, some signs of thought and some energy of language.

By Sea and by Land. Being a trip all round the world. By Henry Alworth Merewether, one of Her Majesty's Counsel. (London and New York: Macmillan & Co. 1874.)—For an old gentleman past sixty, a journey round the globe is still an arduous and, physically speaking, a creditable achievement. In undertaking it, our author showed himself a typical Englishman, and in the cause of his making it—the dispersion of his family—we have a reflection of the British Empire. He had a brother and married daughter in India, another brother in Australia, and two sons in New Zealand, whom he wished to see once more, probably for the last time. This determined him to go eastward through the Suez Canal, and curiosity to visit the New World led him to brave the tedious voyage from Sydney to San Francisco, and afterwards to cross the continent by rail. It is easy to feel an interest in so respectable a tourist, and to content ourselves for learning a little less about the countries he visits by learning a little more about him. We soon know him for a good-natured Tory, whose aversion to radical rule is hardly greater than to the rules of grammar, but who is capable of conquering his prejudices, and whose business as a traveller is to tell a plain tale of what he sees. His conservatism and his slipshod writing are illustrated in an early passage relating to his children: "Well, I had settled some of the thirteen, but among them were two boys at Winchester (notorious in these days for that absurd 'Tunding' controversy, of which I have received many, and should have been far better if I had got more)," etc. Of the countless instances in which *who* is used for *whom*, as flagrant as any is this one: "It reminded me of the poor mother in the quarantine ground, who it required all the stern vigilance of the Sydney Dogberry to prevent her folding her arms round her nice little girl." This literary license, however, as it began by melting the proof-reader's severity, ends by conciliating those who find other reasons for being in good humor with Mr. Merewether. A vein of pleasantry, never rising to wit, runs through all his narrative, as when, fearing an attack of cholera, he says: "I began to think seriously about it, and it will be pleasing to you, my friends, that I contemplated some post-mortem gifts to each and every of you—to one my watch, to another a set of ivory brushes. However, being willing still to come up to time and to brush my hair, I, directly I got home, took some chlorodyne, which happily composed internal troubles." Or, again: "To tell you the truth, I was beginning to

tire of mosques, especially as they are called musjids, which is a name conjoined with Sir Joseph Hawley's horse, which gave me the only painful recollection out of thirty-eight Derby Days."

Mr. Merewether's flying impressions afford little opportunity for quotation. In the garden of a fine house in Bombay he saw "a croquet-ground lit by gas, so that the game may be prolonged after the sun is gone down." At the Madras arsenal: "I was much struck, amidst an interesting collection of old arms, with the smallness of the hand-place for grasping the sword. A female would not have found the majority of them too large." We pass over his not very comfortable experiences in Australia and New Zealand, and his gloomy predictions of the future of society in the former country. Arriving in the United States, he saw a horse-race in San Francisco, saluted Brigham Young in Salt Lake City, visited rebuilt Chicago, admired Niagara, and—crossed the ocean delightedly with Barnum, some of whose long yarns he reproduces with great gusto. Mr. Merewether assigns the showman a home at "Bridport," alludes to the eminent preacher Dr. "Chafyn," and to President "Fillimore," and comes within about a mile of his mark when, apparently under the delusion of a false etymology, he speaks of "'spendoolia,' a pleasant American word for money." His car-window observations are enough to make him enamored of the country, to which he awards the palm over the English colonies he had just visited. "Of all places in the world where a man may be most comfortable, most independent, and may do best, America is the place for me." A single one of his reflections on American society appears to us worth citing:

"Giving this amount of consideration to the lower orders has gradually led to such a system of corruption in state matters as is incredible. They have not fine feeling enough to appreciate what in other countries would be considered as operating as an actual bar to a man's elevation to a public post. Let me give this instance: There was a contest for a judgeship, the judges there [in San Francisco] being only elected for a period, and not, like ours, for life. One of the candidates had been accused of misappropriating some bonds, and the matter was still under enquiry. One would have thought that such a charge against a man who was an applicant for judicial station would at once have made his case hopeless. For, indeed, I have known, and still know, gentlemen who fill a high station at the bar, and have a large business, but against whom there is a 'something.' They may retain their practice, and so on, but they never hope to be made a judge. I ask the experience of my legal brethren whether such is not the case What was the case with this worthy man? He was a popular man, and the 'unwashed' voted for him as 'a smart fellow,' and he was elected."

The Dramatic Unities in the Present Day. By Edwin Simpson. (London: Trübner & Co. 1874.)—The phrase "dramatic unities" is one which, we fancy, is occasionally used by writers without exact comprehension of all that is implied by that once-potent formula, and when there is a disposition among dramatic critics to revive it, as, according to Mr. Simpson, is the case at present in England, it is only proper that their claim should be carefully considered. For this purpose this little volume will be found to be admirably fitted. It quotes from Aristotle the passages which are assumed to be the basis of the theory, and at the same time points out their application in the work of Gian Giorgio Trissino, one of the court of Leo the Tenth, and later writers. It is shown that the Greek tragedians did not comply with the laws afterwards formulated from their plays; and there follows an excellent summary of the arguments on the matter, with quotations from the French critics who supported it, and from Schlegel, Lessing, Goethe, and Dr. Johnson on the other side. There are also admirable illustrations of the difficulties of exact compliance with the rules imposed upon the French tragedians. Statistics are given of the efforts of English playwrights to cut themselves free from all the traditions of their wonderful dramatic literature and to fashion their work after the requirements of unnatural laws.

As the matter now stands, it would seem to be beginning at the wrong end to attempt to reform the defective play-writing of the present day by imposing novel and difficult rules upon a class of authors who are for the most part incapable of rising above abject triviality. The general principle we can look at with great equanimity; the battle has been fought, and the absolute power of the dramatic unities has been broken, but there is no one who would condemn a good play because the author had chosen to observe them. To demand them, however, to insist on them, is a very different and a most mischievous thing. One might as well ask of our artists that they paint nothing but Madonnas. How small is the foundation on which the theory rests is clearly and temperately shown in this little book; we hope it may be read, if for no other purpose than to see how a pretentious and bastard formula can impose for a long time on literature.

HENRY HOLT & CO.'S SCHOOL-BOOKS

Include among others, Freeman's Historical Course, the Class-room Taine, Siglar's English Exercises, the Ordo Series of Classics, Whitney's German Course, Otto's French and German Courses, etc. Reference is made to the faculties of all leading institutions. Catalogues sent on application. Address

Fourth Avenue and Twenty-third Street, New York.

GUNNAR: A NORSE ROMANCE. By H. H. Boyesen. Saunterer's Series. 1 vol. 18mo, $1 50.

"Gunnar has a kind of unworldly pathos and simplicity about it, that makes it seem, among the hot-pressed, over-ripe romances of the day, like a shy English violet among gaudy and scentless hot-house flowers."—*New York Tribune.*

HOMES AND HOW TO MAKE Them. By E. C. Gardner. 1 vol. square 12mo. Illustrated by the Author. $2.

A popular book by a skilled architect, showing in the clearest and most practical way how people may, with comparatively small expense, build healthy, comfortable, convenient, attractive homes.

*** *For sale by all booksellers. Sent post-paid on receipt of price by the publishers,*

JAMES R. OSGOOD & Co., Boston.

HARPER'S CATALOGUE. The attention of those designing to form libraries, or increase their Literary Collections, is respectfully invited to Harper's Catalogue, which comprises a large proportion of the standard and most esteemed works in English Literature—*comprehending over three thousand volumes.*

Librarians, who may not have access to a trustworthy guide in forming the true estimate of literary productions, will find this Catalogue especially valuable for reference.

The Catalogue is arranged alphabetically by the authors' names, anonymous works by their titles. The index is arranged by the titles of the books, besides having numerous appropriate heads, each general head being followed by the titles of all works on that subject.

Harper's Catalogue sent by mail on receipt of ten cents.

Address HARPER & BROTHERS,
Franklin Square, New York.

J. W. BOUTON'S
PRICED CATALOGUE
(41) of Choice Recent Importations and Purchases, comprising Standard and Miscellaneous Authors, Works on Witchcraft, Sorcery, Magic, Provincial and Anglo-Saxon Glossaries and Dictionaries, Fine Arts, Galleries of Engravings, Etchings, Architecture, Antiquities, etc., etc. Now ready, and sent to any address upon receipt of stamp to pay postage.

THE WEEK IN TRADE AND FINANCE.

NEW YORK, September 7, 1874.

WITH the exception of a moderate increase of business in the speculative stocks at the Stock Exchange, the past week has shown no new feature of importance. There is no change to report in the condition of the money market beyond a slight hardening in the rates on commercial paper. Prime endorsed names have ruled between 6½ and 7½ per cent., while good endorsed paper having three and four months to run is quoted at 8 to 9 per cent. Sales of extra choice endorsed names having sixty days to run are reported as low as 4 per cent.; but these were entirely exceptional. Money on call, secured by Stock Exchange collaterals, continues to rule between 2 and 3 per cent., with the bulk of business doing at 2½ per cent.

The foreign news is unimportant. The Bank of England minimum discount rate remains unchanged at 3 per cent., with money in the open market obtainable at 2¾ per cent. The Bank of England lost £94,000 in bullion, and the Bank of France lost 75,000 francs in specie, during the week.

The weekly statement of the New York Clearing-house banks on Saturday was unfavorable, the banks having lost $1,677,900 in legal tenders. The surplus reserve is down $1,361,175. The following shows the changes in the averages for the week ending September 6, as compared with those of the previous one:

	August 29.	Sept. 5.		Differences.
Loans	$278,319,800	$279,084,900	Inc..	$765,100
Specie	18,638,100	18,891,300	Inc..	253 200
Legal tenders	67,282,600	65,604,700	Dec..	1,677 9 0
Deposits	235,000,100	234,746,000	Dec..	254.100
Circulation	25,803,300	25,662,400	Dec..	140,900

The following shows the relations between the total reserve and the total liabilities:

	August 29.	Sept. 5.		Differences.
Specie	$18,638,100	$18,891.300	Inc...	$253.200
Legal tenders	67,282,600	65,604,700	Dec..	1,677,900

The stock market has been active, and prices generally at the close on Saturday showed a considerable advance over those at the close of the previous week. The most active stock was Western Union Telegraph, upon which a declaration of a quarterly dividend of 2 per cent. was made; this gave a stimulus to the market for the stock, under which the price advanced from 76⅛ on Monday to 78⅞ on Saturday. Union Pacific followed, and ran from 27⅞ to 30⅞. Lake Shore was next in importance in amount of dealings, and advanced from 72⅞ to 73⅞. The basis for the upward movement in stocks seems to have been the large uncovered short interest. A few operators bought largely to cover their own shorts, and, beyond this, to place themselves on the bull side of the market by going long. The effect of this was to set all the small operators, both in and out of the Stock Exchange, to buying stocks, and to such an extent that prices would undoubtedly have advanced much higher than they did had not those who were at the bottom of the movement stood ready to sell at the moderate profit which was offered.

The market to-day opened at ¼ per cent. higher on the leading stocks than it closed on Saturday, but under sales made to realize, principally upon Rock Island, the market underwent a fractional decline, except on Wabash, which fell off from 32⅞ to 31½. This was followed by a better feeling, upon which the market improved and finally closed strong at an advance of ⅛ to 1 per cent. from the closing prices of Saturday, the greatest improvement being in New York Central and Western Union, both of which were 1 per cent. higher. The investment stocks have been quiet. There was some activity in New Jersey Central, caused by a circular from the Company offering $5,000,000 new consolidated bonds to the stockholders for the purpose of making certain improvements. This was unfavorably looked upon at first, and led to considerable sales being made on sellers' option, the price at one time being 102¼. The low price of the stock brought out good buyers—friends of the road—and the price soon rallied up to nearly that at which it stood previous to the receipt of the circular.

The following shows the highest and lowest sales of the leading stocks at the Stock Exchange for the week ending September 5, 1874:

	Monday.	Tuesday.	Wed'day.	Thursday	Friday.	Saturday.	Sales.
N. Y. C. & H. R.	101⅜ 102⅛	102¼ 101⅜	102⅜ 102⅝	102¼ 102½	102⅜ 102⅝	102⅜ 103	15,000
Lake Shore	72⅛ 73⅜	73¼ 73⅜	73⅜ 74⅜	73⅝ 74⅛	73⅜ 73⅝	73⅝ 73⅞	112.400
Erie	32⅞ 34⅛	34⅜ 35⅜	34 35½	33⅜ 34⅜	33½ 34	33⅜ 34	75,800
Union Pacific	27⅜ 28⅜	28¼ 29½	29½ 30⅜	30 31	29⅜ 30½	30¼ 30⅞	149,500
Chi. & N. W.	37⅜ 38⅛	38 38⅜	38¼ 38½	38⅜ 38⅛	36⅜ 37⅜	36⅞ 38	17,500

W. U. Tel	76¼ 76⅝	76⅜ 77⅜	77⅜ 78½	77⅜ 78⅜	77⅜ 78¼	78½ 78⅞	216,900
Pacific Mail	47⅛ 47⅝	47⅝ 47⅞	47½ 47⅞	47¾ 47⅝	47¼ 47⅝	47⅜ 48⅛	65,300

Government bonds have been quiet and prices steady. The Secretary of the Treasury has issued another call for $15,000,000 5-20's of 1862, on which interest will cease December 1.

The following are the closing quotations of Governments this evening:

	BID.	ASKED		BID.	ASKED
Registered 6's, 1881, c	118¾	118⅝	Registered 5-20's, 1867, c	117⅛	117¼
Registered 5-20's, 1862, c	112⅜	112¾	Registered 5-20's, 1868, c	117⅜	117⅝
Registered 5-20's, 1864, c	115⅜	115¾	Registered 10-40's, c	111¾	112
Registered 5-20's, 1865, M and N	116¾	117⅛	Registered 5's of 1881	112½	112⅝
Registered 5-20's, 1865, J and J.	116½	116½	U. S. Currency 6's	117¼	117¾

The gold market has remained quiet, with the range of fluctuations confined between 109⅝ and 110 as extremes. The Treasury will sell only $3,000,000 gold during the present month. The specie shipments for the week amounted to only $472,000, of which $113,000 was in gold coin.

SPECIAL NOTICES.

TERMS: In advance, one insertion, four cents per word; five insertions, three cents per word, each. The enclosure of a stamped and addressed envelope will secure a numbered box, to which communications may be addressed.

A Young Lady desires a situation to teach the lower English branches in a public or private school, or as visiting teacher. Unexceptionable references. Address TEACHER, 39 South Portland Avenue, Brooklyn.

An educated American, a good Linguist, and accustomed to literary composition, desires employment on some literary or scientific journal, as writer or book reviewer. Address R. C. S., Box 51, Hoboken.

An experienced Classical and Mathematical Teacher, Scholar, and Gold Medallist of foreign University, desires to establish a school in which the thorough drill of English Public Schools would be given. Takes private pupils. Prepares for scientific schools and college (English or American). Highest city reference. Address TUTOR, 29 West Fifteenth Street, New York.

A Visiting Governess, accustomed to teach English, French, and German, has spare hours. Address Box B, *Nation* Office.

A Harvard Graduate, Private Tutor in Cambridge, wants a pupil for the coming College year. Has experience and city references. Address Box 16, *Nation* office.

A Graduate of Harvard College would like two or three Pupils to fit for College or otherwise. Best references. Address Box 17, *Nation* office.

SPECIAL NOTICES.

A Vassar Graduate of three years' experience in teaching, desires a situation in a select school. Refers to the Faculty of Vassar College. Address, Box 15, *Nation* Office.

A Teacher with Experience (ten years in music, four in drawing and painting) wishes employment in a school. MARTHA H. JONES, Meredith Village, N. H.

A Class for Young Gentlemen, and Private Instruction. Circulars sent on application. THOMAS R. ASH, 17 East Sixteenth Street.

Excellent Governesses for Families in abundance. Please address "TEACHERS' AGENCY," Rev. L. W. Applegate, Mauch Chunk, Pa.

Partner with Capital Wanted.—To Manufacture Hardwood Lumber, and also to deal in Pine Uppers. An active and experienced business-man preferred. Best of references given and demanded. Address "Lumberman," 27 East Seventy-fourth Street, New York City.

Wanted.—A Gentleman of literary attainments, and with some capital to put in, desires to make a business connection with some established Publishing House. Address J. T. B., Box 407, Medford, Mass.

Those Seeking Admission to Harvard, Yale, or any other American College, to Sheffield or Lawrence Scientific School, or any School of Technology, can receive thorough preparation at ROGERS HIGH SCHOOL, Newport, R. I. Special provision made for Laboratory Practice. Tuition, $60 per annum. Frederic W. Tilton, A.M. (late Principal of Phillips Academy), Head-Master.

SPECIAL NOTICES.

For Sale.—Vols. X. to XIV. of the Nation inclusive, bound in boards, with red-leather backs. Price $2 50 each if taken together. Address the Publisher, Box 25, New York.

Harvard University Divinity School.— This School is open, on equal terms, to persons of all denominations, and the next term will begin September 24. Information in regard to admission and pecuniary aid will be sent on application to Prof. OLIVER STEARNS, D.D., or Prof. E. J. YOUNG, Cambridge, Mass.

School of Mines, Columbia College.— Courses in Mining and Civil Engineering, Geology, Mineralogy, Chemistry, Assaying, etc., etc. Send for catalogue. C. F. CHANDLER, Dean of Faculty, East Forty-ninth Street, New York.

Bellevue Hospital Medical College, City of New York, session of 1874-75. The Collegiate Year in this Institution embraces a preliminary autumnal term, the regular winter session, and a summer session. The Preliminary Autumnal Term for 1874-75 will commence on Wednesday, September 16, 1874, and continue until the opening of the regular session. During this term instruction, consisting of didactic lectures on special subjects and daily clinical lectures, will be given, as heretofore, by the entire faculty. Students designing to attend the regular session are strongly recommended to attend the preliminary term, but attendance during the latter is not required. During the preliminary term, clinical and didactic lectures will be given in precisely the same number and order as in the regular sessions. The Regular Session will commence on Wednesday, September 30, 1874, and end about the 1st of March 1875. For the annual circular and catalogue, giving regulations for graduation, and other information, address the Secretary of the College, Prof. AUSTIN FLINT, Jr., Bellevue Hospital Medical College.

The Nation.

NEW YORK, THURSDAY, SEPTEMBER 17, 1874.

The Week.

THE discontent which has been smouldering in Louisiana for two years has broken out in an attempt at revolution. The whites in New Orleans have demanded Kellogg's resignation, and, Kellogg refusing, they have erected barricades and fought with the metropolitan police (mostly colored), Kellogg taking sanctuary in the Custom-house. Penn, the lieutenant-governor, in the absence of McEnery, issued a proclamation to the people of Louisiana, urging them to rise and drive the "usurpers" out of the State, and calling out the State militia. The citizens, after very little fighting, got possession of the city and the Government buildings on Tuesday. The President has issued a proclamation calling upon them to disperse within five days, and announcing his intention of enforcing the laws if they do not. The immediate cause of these disturbances is of course the approaching election, the Kellogg party having recently occupied themselves with seizing arms imported into the State, as they say, for the White Leaguers, under the pretence that the vessel which brought them had no manifest. On the other hand, the citizens point to the control which a recent law gave Kellogg over the election machinery, which renders a fair election impossible.

The trouble is now two years old, and, while there is little sympathy anywhere in the country for the violent remedies now adopted, there is as little doubt that the citizens are right in maintaining that Kellogg has been kept in power by fraudulent means and that his government is a usurpation. The history of the case has been often told. At the election of 1872 in Louisiana, there were two canvassing boards, both claiming to exercise the right of canvassing the votes cast, one in the interest of McEnery and the other in that of Kellogg. As nearly as can be made out, the Warmoth (McEnery) board was probably not a legal body, but it got possession of the returns, which showed a majority for McEnery, while the other board, which had no returns at all, was probably the only body legally authorized to canvass in the State. But before either board had made any returns, Kellogg and Casey got an order from Judge Durell, of the United States District Court, directing United States troops to take possession of the State House and install the Kellogg government. These matters were investigated more than a year ago by a Senate Committee, consisting of Messrs. Carpenter, Anthony, Alcorn, Logan, Trumbull, Morton, and Hill, and a majority reported that there was no State government existing in Louisiana; five members found that, if there was any legislature at all, it was the McEnery legislature. There could not well have been a more explicit censure of the method by which Kellogg had got possession of the State government; nevertheless, his government has been the only one recognized at Washington from the day of the election to the present moment.

Mr. Moulton's long-promised "statement" appeared during the week. It is of great length, and it would be impossible to analyze it, even if we had the space at command. Moreover, it is hardly necessary or worth while to do so, in view of the fact that the case is coming before the courts in October, when the whole story will be told over again, and when Moulton and Tilton and all concerned will be publicly examined and cross-examined. It is proper to say of the statement in the meantime, however, that, though damaging to Moulton himself in the highest degree, it unquestionably contains enough new matter, and enough corroboration of old matter, to render the report of the committee exonerating Mr. Beecher incomplete, and to render some further process of vindication absolutely necessary. He must assume the offensive before some differently-constituted tribunal, and we would earnestly warn him and his friends against the supposition that the eager, credulous affection of Plymouth Church can save his character. It is well as far as it goes, but it goes only a very little way.

The greatest value of the Moulton statement lies, on the whole, in the fresh illustration it affords of the morality of chromo-civilization. A more revolting picture than he paints of this could hardly be imagined. Tilton drags his wife and children through a slough of filth to revenge himself on Dr. Bacon for calling him "a dog." Moulton assumes to Beecher the relation of an intimate friend, and the repositary of awful secrets, which he blabs to his wife, his business partners, and all sorts of people during nearly the whole period. His pastor confesses to him offences of the most revolting kind, and he and his wife discuss them with the said pastor and his paramour in a friendly social way, and help him to conceal them and to retain his place as a Christian minister, and they both attend his preaching. Whenever, too, the parties to the scandal have anything particular to say to each other by way of reconciliation, or explanation, or accusation, or apology, they apparently cannot trust each other's oral statements, but draw up written protocols and treaties, which they confide to each other in solemn secresy, but immediately begin to show to their friends. One husband in the drama mentions to some ladies at a dinner party an attack made on his wife's virtue by his religious teacher as part of the social gossip of the day. The Mutual Friend and "Man of the World" in the affair, too, when he finds himself in a position of great perplexity in the discharge of a duty of the utmost delicacy, selects as his adviser a criminal lawyer notorious for the knavery of his practice and for the dishonesty of his public and private life, and fills his report of his trust with filthy insinuations, and sneers, and commentaries evidently suggested by this old satyr; and the reason he gives for going to such a counsellor in such a case is that he once got him clear of a charge of fraud brought against him by the Custom-House.

In nothing does the moral rottenness of the circle show itself more thoroughly than in the readiness of its members to draw up and publish sham cards, correspondences, and reports intended to deceive the public, either by downright falsehoods or misleading suggestions. One of their favorite ways out of a quarrel appears to have been the joint composition of letters containing fulsome eulogies on each other, and the presentation of them to the world as spontaneous and sincere expressions of feeling, or of cards containing a few open lies. One injured husband actually drafted a report, which he wished a committee of Christian men to sign, pretending to have made a thorough examination of facts which they had not examined, and to have reached the conclusion that he, the husband, his wife whom he believed guilty of adultery, and the partner of her crime, were all three persons of great "moral integrity and elevation of character."

General Butler has delivered the opening speech in his district, announcing his intention to run for Congress, and making a rather lame defence of his last winter's campaign in Washington. He gives his reason for voting in favor of the first inflation scheme, and it is, as might have been expected, that he knew that what the country needed was inflation, and not contraction. He says that the great curse of this country now is the high rate of interest for money, about which he seems to have some private information, for he says it is from 12 to 15 per cent. He declared that the money-lenders are the only people in the United States who make any money, for they lend to the producer, and, taking from him 12 or 15 per cent., leave him nothing for profit, so that he has to cultivate

the ground at a loss, and continually falls behind, until he will very soon have to stop altogether. Perhaps by that time the money-lender will see how foolish his conduct has been, and lower his rates; but the General does not hold out any hopes of this. He makes another curious statement of a mysterious link which, he says, in the last Congress bound together the *Alabama* Claims Bill and the inflation scheme. The seat of empire, the General said, as many gentlemen have said before him, is now west of the Alleghanies; and the seat of empire wanted inflation. Massachusetts, he knew, might be doubtful about inflation, but the Massachusetts fishermen who had their vessels burnt by the *Alabama* wanted their claims paid. General Butler saw, therefore, that if he wanted the seat of empire to vote for the *Alabama* Bill, he must do something for the seat of empire in the inflation business in return. He therefore voted for inflation, and the *Alabama* Bill was passed. He would probably have furnished us with this explanation sooner if he had thought of it.

Politics in New York are rapidly approaching a crisis. The Democrats meet this week in convention at Syracuse, and will determine the question whether Mr. Tilden is to be nominated for governor or some one else. Tilden would probably make the strongest candidate the party can put up, and he is supported by Tammany Hall, now under the leadership of John Kelly, a Catholic, and formerly sheriff, who has made himself a good deal of political capital out of the mayor's case. The Governor has decided this matter, declining to remove the mayor, but severely censuring him for his disregard of public opinion and his reckless misconduct in office. With regard to the reappointment of Charlick and Gardner, each being appointed to the other's vacant place, the mayor stated in his answer to the charges against him that "this was done to evade no law," but "with the view to prevent the making of any question as to the legality of the appointments." As to this the Governor says:

"If there is any appreciable difference in the two branches of this proposition, it is believed that there will be found an insurmountable difficulty in logically defining it. It cannot be doubted that there was, in regard to the reappointment of the commissioners, an indirectness of action unworthy of the character of its author—by the device of procuring their resignations before the executive could give notice that vacancies were caused by their conviction; of obtaining from a subordinate in the law department an opinion in favor of the legality of their reappointment; of assigning each to the vacancy created by the other; and of hastening the consummation of the act, after receiving the Governor's notice, without having recourse to the best authority to assure himself that he was not acting in violation of law. In all this, and in the reappointment of the convicted commissioners while under indictment for other offences, he offered an affront to public opinion and to the moral sense of the community, which resulted, as might have been expected, in compelling them to abandon the posts in which they were thus indecently reinstated."

This is very well put, and effectually riddles Havemeyer's defence. Havemeyer's disappearance from public life is, of course, and has for some time been, a foregone conclusion; but as yet nothing seems settled as to his successor. Whoever he may be, we may be quite sure that the career of Havemeyer will be a warning to him—and particularly so if the next governor happens to be Dix.

The Chicago *Tribune*, in reply to the recent article in the *Nation* on "Chicago and the Insurance Companies," characterizes the statement made by us that, "so far as can be made out, they (the people of Chicago) have built up the city since the great conflagration of 1871 in very much the same condition as the fire found it," as being "extraordinary," "reckless," and "injurious," and mentions various particulars in which the rebuilt district is safer than before it was burnt. We have considered the *Tribune's* suggestion that we should send a competent investigator to report upon the condition of the rebuilt district, but we have decided not to do it; first, because any one can see that our article refers to the general unsafe condition of the city, and not to particular districts or buildings; and, second, because a committee of competent investigators have been examining into the condition of the city for some time past—men entirely without bias—and they have made an elaborate report to the insurance companies, which is now before us; and these investigators reach the conclusion that "the city of Chicago is liable to a large conflagration at any time: first, from the inflammable material of which most of the city is constructed, and the reckless manner in which buildings are put up and light material stored; second, from its natural situation on flat ground, without protection from the gales that sweep with such violence from the prairie on the one side and the lake on the other;" and the National Board of Underwriters have, solely in consequence of these reports, decided to take no more risks in Chicago after the 1st of October, unless immediate means are taken to render the city safe. More than this, we know of policies being cancelled here now in advance of the decision of the question, to large amounts. The important thing for the people of Chicago to understand is this: Their city is peculiarly exposed to danger, owing to the frequent occurrence of high winds from the prairies, from which the place cannot be protected. Besides this, the business part of the city is surrounded by a belt of inflammable wooden buildings, which make the whole a tinder-box; and the Fire Department is a rotten piece of political machinery.

Senator Schurz has openly embarked with the People's Party of Missouri. At a ratification meeting on Friday night in St. Louis he made a brief speech, and promised a longer one shortly on national as well as on State questions. For the new organization, he disclaimed any pretence of its being the nucleus or starting-point of a new national movement, describing it as simply a popular uprising to rescue the government of Missouri from the reckless and partisan rule of rings. His own share in this movement was that of an individual citizen; it neither proceeded from him, nor had any reference to the promotion of his political interests. It had, however, his full sympathy, and would receive his active support; and though as regards the question of the national finances it might be said to "sit on the fence," he with others would make an honest effort to help it down on the right side. One of the firm resolves of the new party, according to Senator Schurz, is "that the shameless and alarming brigandage and ruffianism which so long have been permitted to disgrace the name of the State in the eyes of the civilized world, and have frightened away immigration from our borders, be at last rooted out with a strong hand."

The Maine election, which took place on Monday, was not of much importance. The State was of course carried by the Republicans, but the person chiefly interested in the result was probably Mr. Blaine, who had been promised by his friends an increased majority as a complimentary vote and a "send off" in the Presidential race. This he got, and is probably well contented. The elaborate calculation now going on in the Republican and Democratic newspapers as to the significance of the result in particular counties, in comparison with votes of previous years, will, we fear, lead to nothing decisive. The cry, "Oh! have you heard the news from Maine?" was once a soul-stirring enquiry. But it has lost its emotional value for the year from the fact that most people who have heard the news have also forgotten exactly what it was.

The South Carolina Republicans have adopted a platform and nominated Mr. D. H. Chamberlain, formerly Attorney-General, for governor. The objections to Mr. Chamberlain as a reform candidate are that, if not himself a thief, he was, under the Scott régime, badly mixed up with thieves. Nevertheless, as Moses is thus thrown over, the authorities at Washington are probably pretty well satisfied with the result. The platform adopted promises to carry out all the financial reforms which are necessary and have been promised and have been "in large measure fulfilled"; and demands the passage of the Civil-Rights Bill and the renomination of General Grant.

There are undoubtedly signs of "revival in business" in nearly all directions, and there is a considerable increase of activity in the

dealings on the Stock Exchange, which, in spite of the wickedness of brokers and speculators, is also a healthy sign—those persons who last fall thought the railroads could be cut off from the general interests of the country, and treated as a corrupt and immoral department of the national industry, having proved egregiously mistaken. Railroads cannot prosper unless the country is prospering; and that the country is recovering, the increased amount of freight carried by the railroads shows clearly, even if the increase in the amount of receipts does not as yet show it. And all this is perfectly natural and proper. The panic of last fall was not caused by losses such as we sustained during the war; nor yet to any great extent by over-investment in railroads, for the truth is that most of the capital put into the new railroads, over whose existence there has been so much lamentation, was foreign capital, the "sinking" of which does not incommode us in the least. Indeed, most of the trouble was caused by panic—that is, by vague terror; and what is now most needed to restore trade and industry to their normal condition is the disappearance of vague terror, though we do not anticipate its complete disappearance until the currency is put on a solid footing. As long as Congress pretends to control the amount of the circulating medium, we shall have more or less distrust.

If this view of the matter be correct, the labors of persons like the financial writer of the New York *Tribune*, who seems to be an able and well-informed man, in trying to prolong and intensify the prevailing distrust, may fairly be called mischievous. Although of late he has been compelled to admit that things are looking somewhat better, he does so with the utmost reluctance, and groans piteously every morning when he looks at the railroads, or the iron trade, or dry-goods trade, or grain trade, or, in fact, almost any field of activity in which there is buying and selling. He pretends sometimes to believe that we are now suffering from the effects of the war which closed in 1865; at others, that all the new railroads were made with hard-earned American money, which is now lost. One day he remarked that a friend of his, of the same gloomy temper, declared that it was as great folly to invest in railroads and stocks now as to have invested in slaves in 1860, a view which he evidently would like to take himself, but is ashamed. In fact, it would appear from his preachings that the only safe thing for an American man to do at this juncture is to sit quietly on an empty packing-box and wait. We must do him the justice to say that he does not treat us to any of the old post-panic gospel, and call for "fewer yachts and fast horses and champagne and a return to old-time simplicity and frugality"; but that he is unhappy there can be no doubt.

The main topic of interest in Europe is the condition of Spain. There is now no doubt that the Carlists have gained ground during the summer. Zabala accomplished no more than Moriones or Concha. Nearly all the positions captured in the spring are back in the enemy's hands, and the situation looks more serious than it ever did, for the plain truth is that there is nothing between Don Carlos and Madrid but a herd of raw and ill-led levies, and why he sticks so continuously in the mountains it is difficult to understand, unless he feels the want of cavalry. The other day, he took one hundred pieces of artillery and a large quantity of ammunition in Seo de Urgel, and in fact, as regards artillery, may be said to be very well off. An illustration of the supineness of the Republican army and the activity of the Carlists which has been much talked of, was furnished very recently by nine Carlists coming down to a railroad station in the heart of Zabala's position, knocking the engine-driver of a locomotive on the head, and carrying the locomotive off before the alarm was given. These and similar things, such as the easy capture of towns and villages, begin to be ascribed to the spread of treachery or to lukewarmness to the national cause among the people. A correspondent of the London *Times* describes the trade in contraband of war between Bordeaux and Nantes and the Carlist posts as enormous.

The Spanish Government has added to its political and military misfortunes the perpetration of an offence which between individuals would receive a very hard name. Our readers may remember that last year, after it had been for some time in default with the interest on the public debt, an arrangement was proposed which we described at the time, after Marshal Serrano came into power, by the Minister of Finance, Señor Echegaray, which was equivalent to what our defaulting railroads call "funding the coupons." In other words, the bondholders were to get for their arrears something in cash on condition that they took the balance in new bonds, and for the payment of the cash two kinds of collateral were to be deposited in the Bank of England, amounting in value to $25,000,000. The first was bonds issued by the Rio Tinto Mining Company, and the other was bonds of the purchasers of "National Property." This proposal was formally accepted by the committee, the bondholders sitting in London, and a contract embodying it was signed on behalf of the Government by Señor Echegaray and by the representatives of the bondholders, approved by the Council of State, and ratified by the minister of state. Under it, the Rio Tinto bonds were duly deposited in the bank. There was some delay about the others; and in the interval Señor Echegaray went out of office, and was succeeded by Señor Camacho, and it began to be rumored that the latter was inclined to repudiate the contract. The bondholders, however, though uneasy, thought that as long as the Rio Tinto bonds were in hand the agreement would probably after a while be carried out. But in July, however, there arose a report that the Rio Tinto bonds would be carried off; so the wretched creditors rushed into the Court of Chancery to get an injunction restraining the Bank of England from parting with them. But Camacho was too smart for them. By the time the injunction was out the bonds were gone, and he now says he will not carry out the old contract at all, but that he will propose another more advantageous for Spain. The bondholders naturally are furious, and decline to have any new dealings with him, and appeal to Serrano as a gentleman to see justice done. We think Camacho ought to receive a "hail" or two from American "confidence operators" like Pendleton and Butler.

The more particular accounts of the proceedings of the Cnogress at Brussels begin to reach us, although the official report has not yet been published. It is now admitted on all hands that, as seemed likely from the outset, the scheme proved a complete failure. It was originated by Russia, with what object is not well known, but, according to the conjectures of the Continental press, with the view of assuming a sort of moral leadership among the European powers. She was represented by Baron Jomini, who was elected president of the Congress and bore the part of mover in the proceedings; General Voigts-Rhetz, the German delegate, who showed great interest in the matter, for the most part acted with him; but it was apparent, very early, that England and the small states looked on Russia and Germany with suspicion and would enter into no concerted action. There was, of course, no difficulty in coming to terms about small matters, but as regarded the main conditions of warfare there was an irreconcilable difference of opinion. Russia and Germany sought to put as much power as possible in the hands of invading armies, and paralyze as far as possible popular or unorganized resistance. For instance, Baron Jomini proposed that an invading army should be considered as a *de facto* government, which the native officials within the radius of its authority should be bound to serve and obey, and which it would therefore be treasonable to resist. But Belgium, Holland, Switzerland, and Portugal all refused to accede to anything of the kind, or, in fact, to make any concessions likely to limit warfare exclusively to the operations of regular armies. The British representative preserved strict silence throughout. The whole affair, in fact, may be looked on as a curious attempt on the part of the masters of great armies to get the smaller states to agree to have conquest and occupation made easy. Unfortunately, nearly all the philanthropic tendencies of the day run in the same direction.

THE CIVIL-RIGHTS BILL.

TOWARDS the end of the last session of Congress, the Senate passed what was then usually spoken of as the Supplementary Civil-Rights Bill. It did not pass the House, although Mr. Sumner had, with great solemnity, on his death-bed bequeathed it as a sort of legislative legacy to Judge Hoar; and the death of Mr. Sumner and the threatened retirement of Judge Hoar from public life bid fair to leave the bill at the next session without any authoritatively recognized champion in either House. Its passage by the Senate did not at the time attract much attention at the North, except from the regular Republican newspapers, which seemed to regard it with a languid and perfunctory interest very different from the enthusiasm which had greeted the passage of the first Civil-Rights Bill. At the South, however, its fate has been very different. The provision contained in it for the enforcement of equality between the blacks and whites in the schools, we referred to at the time as one that might "be fairly called a blow aimed at popular education," and subsequent events have shown that in the present condition of politics at the South it might have also been fairly called a blow aimed at the party which had passed it; for in the States in which the Republicans still have strength, the passage of the bill has furnished the Conservatives with a powerful argument. Everybody in the South, Republican and Democrat alike, knows that the white children will not go to school with the black children, or be forced to do so by their parents and guardians, no matter what the latest civil-rights bill may be, and that the attempt to enforce a provision for mixed schools would only result in breaking up the whole school system. What is more than this, there is no evidence that the blacks themselves are particularly ambitious of social equality, or want either mixed schools or mixed hotels or cemeteries.

The Republicans in the Southern States, therefore, have found themselves in a very awkward predicament. They wish to conciliate the blacks, and it will not do for them to desert the party. At the same time, the last thing in the world that they want is to threaten the native white Southerners. The Conservatives of course denounce the attempt to pass in the last Congress a measure subversive of the whole social order at the South, and the Republicans find it very difficult to make any reply which will not either involve them in the support of an odious bill, or make them seem to turn their backs on their party. It is not at all unnatural, therefore, though it is curious, to find the Alabama Republican Convention, held about a month since, passing resolutions not in favor of but against "social equality," declaring that the Republican party in Alabama "does not desire or seek mixed schools or mixed accommodations for the colored people," and that "no civil law can or should invade the line of social exclusion that society gave us by laws more inexorable than statute or common law."

Since the discussion now going on with regard to this subject began, it is a singular fact that the constitutional power of Congress to pass any such bill as the Supplementary Civil-Rights Bill has hardly been questioned at all. It was discussed of course in Congress; but, since Congress adjourned, public discussion has been almost exclusively confined to the policy of the bill, and, from the articles in the newspapers and the stump, it would require some time and pains to discover that there were any constitutional questions involved. Yet there can be little doubt, if it were not for the fatal habit we have fallen into since the war of regarding the central Government practically above the law and the Constitution whenever the negro is concerned, that the mere suggestion of the constitutional points involved ought to have killed the bill for ever. It is plainly unconstitutional.

The bill provides that "all citizens and other persons within the jurisdiction of the United States shall be entitled to the full and equal enjoyment of the accommodations, advantages, facilities, and privileges of inns, public conveyances on land and water, theatres and other places of public amusement, and also of common-schools and public institutions of learning or benevolence supported in whole or in part by general taxation, and of cemeteries so supported, and also the institutions known as agricultural colleges, . . ." without regard to race, color, or previous condition of servitude, and makes "any person" who shall deny these equal privileges liable to $500 damages at the suit of the aggrieved person, and to conviction for a misdemeanor, with a fine of $1,000 and imprisonment for a year; and gives exclusive jurisdiction to the United States courts in all criminal proceedings arising under the act. There are also provisions with regard to service on juries; but the important part of the bill, and that which is causing the present excitement in the South, is that we have just cited.

The bill was passed in the Senate, it is to be presumed, under the impression that the power to pass it is somewhere given or implied in the Constitution, and the only clauses that have been cited in support of such a power are from the Fourteenth and Fifteenth Amendments. The Fifteenth Amendment relates entirely to the right to vote, but the Fourteenth Amendment contains this clause (sec. 1): "No State shall make or enforce any law which shall abridge the privileges or immunities of citizens of the United States, nor shall any State deprive any person of life, liberty, or property without due process of law, nor deny to any person within its jurisdiction the equal protection of the laws." This is all there is. The childish provision that "Congress shall have power to enforce by appropriate legislation the provisions of this article," adds nothing whatever, for Congress always has this power.

The first thing that strikes the mind with regard to the new Civil-Rights Bill, on comparing it with the Fourteenth Amendment, is that one contains a series of provisions and prohibitions directed to *persons*, while the other contains simply prohibitions against action on the part of the *States*. The Civil-Rights Bill, stripped of its technical phraseology, amounts to this—that if any white man shall turn a negro out of a hotel, or school, or car because of his color, he can be sued and prosecuted criminally in a United States court by the negro. The Amendment merely says that "no State shall make or enforce," "nor shall any State deprive," etc., etc. Nor is there the slightest difficulty in discovering what such prohibitions as these mean. The Constitution contains several of them. Article I., section 10, clause 1, provides that "no State shall enter into any treaty, alliance, or confederation; grant letters of marque and reprisal; coin money; emit bills of credit; make anything but gold and silver coin a tender in payment of debts; pass any bill of attainder, *ex post facto* law, or law impairing the obligation of contracts, or grant any title of nobility."

Of these provisions, there is one which fortunately has received unanimous construction, uniform and uninterrupted, almost from the beginning of the Government, and that is, "No State shall pass any law impairing the obligation of contracts." From the days of the Dartmouth College case to the present it has always been held that the effect of this clause was to nullify and avoid any State law impairing the obligation of contracts; but it has never been supposed for a moment that it authorized Congress to pass a statute making it a penal offence for a citizen to do any act under a State law passed in violation of the obligation of contracts. For the sake of illustration, let us take the case of the charter of a college, always held to be a contract, and suppose that the educational reformers in Congress discover that the States are beginning to manage their colleges in such a way as to impair the obligations of their charters by taxing them when they have no reserved right to do so, demanding illegal qualifications of the professors, and so on. Does any one suppose that the United States could, under these circumstances, make any act done in pursuance of these State provisions a penal offence against the United States triable only in the United States courts, and could send the State authorities to jail for attempting to carry it out? The States pass laws from time to time exempting large amounts of property from execution, and the Supreme Court holds these laws unconstitutional so far as they apply to past contracts. Suppose, now, that Congress should pass a law forbidding debtors to invoke the aid of the State law and to keep or transfer the exempt property, and should make these acts penal, and give the United States courts exclusive jurisdiction

of cases arising under such a statute. No one would undertake to deny that such laws as these were usurpations, yet in principle they do not differ from the Supplementary Civil-Rights Bill.

In other words, if the Supplementary Civil-Rights Bill is constitutional, there is nothing that we can see to prevent Congress, on the ground of protecting the "privileges and immunities" of citizens against invasion by the States, from passing a law bringing all common-law rights within the scope of a single statute, and declaring that any one, white, black, or yellow, who suffers any wrong any where at the hands of any other person, white, black, or yellow, may treat it as a criminal offence against the United States, and have the offender fined and sent to jail for it. Supposing, for instance, that the legal rate of railroad fare in a State is three cents a mile, there is nothing in the world to prevent Mr. McCrary and his friends, next winter, from passing a law making any conductor who charges five cents amenable to this new code in the United States Courts.

The Fourteenth Amendment has twice come before the Supreme Court at Washington, and on neither of these well-known occasions was the decision of the court of such a character as to lend much encouragement to those who believe the new Amendments to have introduced very revolutionary principles as to the relations of the States to the General Government. The first of these was the New Orleans Slaughter-house cases, in which the Supreme Court directed that the new prohibitions on States did not interfere with the rights of States to manage their own internal police, although in the cases in question this regulation led to a slaughter-house monopoly in the hands of a privileged slaughtering company. In the other, Mrs. Bradwell's case, the same court held that the new Amendments did not give women the right to practise in State courts where the State laws prohibited them. In the light of these decisions, it may safely be inferred that the Supreme Court must look with extreme suspicion upon a law upsetting the domestic law of States on the subject of schools, of common carriers, of innkeepers, and substituting for them the new and strange system invented by the authors of this bill. In the interest of the negro, we trust that it may never reach the court. Deeply as we sympathize with his wrongs, we have no expectation or hope of seeing them righted by hounding on his old masters to acts of violence and lawlessness by the passage of equally violent and lawless acts of Congress. The Reconstruction period is ended, and the negro in future will occupy such a position as his industry and sobriety entitle him to. Such bills as the one we have been considering do nothing for him but turn his friends into enemies.

TYNDALL AND THE THEOLOGIANS.

THE recent address delivered by Professor Tyndall before the British Association at Belfast, in which he "confessed" that he "prolonged the vision backwards across the boundary of experimental evidence and discerned in matter the promise and potency of every quality and form of life," produced one by no means very surprising result. Dr. Watts, a professor of theology in the Presbyterian College in that city, was led by it to offer to read before the Biological Section of the Association a paper containing a plan of his own for the establishment of "peace and co-operation between Science and Religion." The paper was, as might have been expected, declined. The author then read it before a large body of religious people, who apparently liked it, and they passed him a vote of thanks. The whole religious world indeed is greatly excited against both Tyndall and Huxley for their performances on this occasion, and papers by no means in sympathy with the religious world, the *Pall Mall Gazette* for instance, are very severe on them for having "recourse to a style of oratory and disquisition more appropriate to the chapel than the lecture-room," or, in other words, for using the meetings of the Association for a sort of propagandism not much superior in method to that of theological missionaries, and thus challenging the theologians to a conflict which may make it necessary in the interest of fair play to add a theological section to the Association. Of course, when Professor Tyndall passed "beyond the boundary of experimental evidence" and began to see with his "mind's eye" instead of with the microscope and telescope, he got into a region in which the theologian is not only more at home than he, but which theology claims as its exclusive domain, and in which ministers look on physicists as intruders.

But then, Dr. Watts's "plea for peace and co-operation between science and religion" is one of many signs that theologians are, in spite of all that has as yet been said, hardly alive to the exact nature of the attitude they occupy towards science. They evidently look upon scientific men as they look on a hostile school of theologians—as the Princeton men look on the Yale men, for instance, or the New looked on the Old School Presbyterians, or the Calvinists on the Arminians—that is, persons having a common standard of orthodoxy, but differing somewhat in their method of applying it, and who may, therefore, be induced from considerations of expediency to suppress all outward marks of divergence and work together harmoniously for the common end. All schools of theology seek the glory of God and salvation of souls, and, this being the case, differences on points of doctrine do seem trifling and capable of being put aside. It is this way of regarding the matter which has led Dr. Watts to propose an alliance between religion and science, and which produces the arguments one sometimes sees, in defence of Christianity against Positivism, drawn from a consideration of the services which Christianity has rendered to the race, and of the gloomy and desolate condition in which its disappearance would leave the world. Tyndall and Huxley do not, however, occupy the position of religious prophets or fathers. They preside over no church or other organization. They have no power or authority to draft any creed or articles which will bind anybody else, or which would have any claims on anybody's reverence or adhesion. No person, in short, is authorized to bring science into an alliance with religion or with anything else. Such "peace and co-operation" as Dr. Watts proposed would be peace and co-operation between him and Professor Tyndall, or between the theologians and the British Association, but "peace and co-operation between science and religion" is a term which carries absurdity on its face. Science is simply a body of facts which lead people familiar with them to infer the existence of certain laws. How can it, therefore, be either at peace or war with anybody or co-operate with anybody? What Professor Tyndall might promise would be either not to discover any more facts, or to discover only certain classes of facts, or to draw no inferences from facts which would be unfavorable to Dr. Watts's theory of the universe; but the only result of this would be that Tyndall would lose his place as a scientific man, and others would go on discovering the facts and drawing the inferences.

In like manner, the supposition that Christianity can be defended against Positivism on grounds of expediency implies a singular conception of the mental operations of those persons who are affected by Positivist theories, and indeed, we might add, of the thinking world generally. No man believes in a religion simply because he thinks it useful, and therefore no man's real adhesion to the Christian creed can be secured by showing him how human happiness would suffer by its extinction. This argument, if it had any weight at all, would only induce persons either to pretend to be Christians when they were not, or to refrain from assailing Christianity, or to avoid all enquiries which might possibly lead to sceptical conclusions. It is, therefore, perhaps a good argument to address to believers, because it may induce them to suppress doubts and avoid lines of thought or social relations likely to beget doubt; but it is an utterly futile argument to address to those who have already lost their faith. Men believe because they are convinced; it is not in their power to believe from motives of prudence or from public spirit.

However, the complaints of the theologians excited by Professor Tyndall's last utterances are not wholly unreasonable. Science has done nothing hitherto to give it any authority in the region of the unseen. "Beyond the boundary of experimental evidence" one

man's vision is about as good as another's. It is interesting to know that Professor Tyndall there "discerns in matter the potency and promise of every quality and form of life," but only because he is a distinguished man, who gives much thought to this class of subjects and occupies a very prominent place in the public eye. As a basis for belief of any kind, his vision is of no more value than that of the Archbishop of Canterbury, who would probably in that region discern the promise and potency of every form of life in a supreme and creative intelligence. Scientific men are continually pushing back the limits of our knowledge of the material universe. They have during the last eighty years made an enormous addition to the sum of that knowledge, but they have not, since Democritus, taken away one hair's-breadth from the Mystery which lies behind. In fact, their labors have in many ways deepened this Mystery. We can appeal confidently to any candid man to say, for instance, whether Darwin's theory of the origin of life and the evolution of species does not make this globe and its inhabitants a problem vastly darker and more inscrutable than the Mosaic account of the creation. Take, again, the light thrown on the constitution of the sun by the spectroscope; it is a marvellous addition to our knowledge of our environment, but then, does it not make our ignorance as to the origin of the sun seem deeper? No scientific man pretends that any success in discovery will ever lead the human mind beyond the resolution of the number of laws which now seem to govern phenomena, into a smaller number; but if we reached the limit of the possible in that direction to-morrow, we should be as far from the secret of the universe as ever. When we have all got to the blank wall which everybody admits lies at the boundary of experimental evidence, the philosopher will know no more about what lies beyond than the peasant, though the peasant will probably do then what he does now—people it with the creatures of his imagination. If a philosopher in our day likes to anticipate that period, and hazards the conjecture that matter lies beyond, he is welcome to his guess, but it ought to be understood that it is only a guess.

The danger to society from the men of science does not, we imagine, lie in the direction in which the theologians look for it. We do not think they need feel particularly troubled by Professor Tyndall's speculations as to the origin of things, for these speculations are very old, and have, after all, only a remote connection with human affairs. But there are signs both in his and Professor Huxley's methods of popularizing science, and in those of a good many of their followers, that we may fear the growth of something in the nature of a scientific priesthood, who, tempted by the great facilities for addressing the public which our age affords, and to which nearly every other profession has fallen a victim, will no longer confine themselves to their laboratories and museums and scientific journals, but serve as "ministers of nature" before great crowds of persons, for the most part of small knowledge and limited capacity, on whom their hints, suggestions, and denunciations will have a dangerously stimulating effect, particularly as the contempt of scientific men for what is called "literature"—that is, the recorded experience of the human race and the recorded expression of human feelings—grows every year stronger, and exerts more and more influence on the masses. The number of dabblers in science—of persons with a slight smattering of chemistry, geology, botany, and so on—too, promises to be largely increased for some time to come by the arrangements of one sort or another made by colleges and schools for scientific education; and though there is reason to expect from this education a considerable improvement in knowledge of the art of reasoning, there is also reason to fear a considerable increase of dogmatic temper, of eagerness for experimentation in all fields, and of scorn for the experience of persons who have never worked in the laboratory or done any deep-sea dredging. Now, whatever views we may hold as to the value of science in general and in the long run to the human race, and in particular its value for purposes of legislation and social economy, which we are far from denying, there is some risk that lectures like Prof. Huxley's at Belfast, dressed up for promiscuous crowds, and produced with the polite scorn of infallibility, in which the destruction of moral responsibility is broadly hinted at as one of the probable results of researches in biology, will do great mischief. For what does it matter, or rather ought it to matter, for social purposes, in what part of a man's system his conscience lies, or whether pressure on a particular portion of the brain may convert him into a thief, when we know, as of experience, that the establishment of good courts and police turns a robbers' den into a hive of peaceful industry, and when we see the wonders which discipline works in an ignorant crowd? When we read that Macdonald started across the plain at Wagram with 10,000 men, and that his column was, during his awful march, so torn with shot and shell that only 1,500 remained to break the Austrian line, but that none wavered, we feel that there are secrets in the composition of human character which Biology is as yet far from being able to explain; and we wish that she would if possible reserve for scientific men any such odds and ends of discovery as she may make, pending the preparation of a complete solution of the problem with which she concerns herself.

Notes.

NOYES, HOLMES & CO. announce for publication next month, 'Sermons and Songs of the Christian Life,' by Rev. E. H. Sears, D.D.; 'The Reasonableness and Efficacy of Prayer,' by Rev. Newman Hall, D.D.; and new editions of Dr. Thomas Hill's 'The Stars and the Earth' and Dr. Henry M. Dexter's 'Congregationalism.'——We have received the third number of *El Ateneo*, a monthly Spanish-American magazine of light literature, published in this city at 31 Park Row. It is well printed and profusely illustrated with woodcuts.——Part 21 of Stieler's 'Hand-Atlas' (New York: L. W. Schmidt) contains maps of France and Switzerland, Southwestern Russia and Turkey, and, in one sheet, South America, which has already been issued in two sheets.——The Bishop of Lincoln's remarks on cremation, on which we lately commented, are said to have been misreported. A correspondent of the *John Bull*, who heard the sermon in which they occurred, says the Bishop was speaking of the probable effects of cremation in weakening the popular faith in the resurrection, not as logically impairing the doctrine itself among "persons of sound and strong belief."——A few additional fall announcements by our publishers deserve mention: 'Campaigning on the Oxus, and the Fall of Khiva,' by J. A. MacGahan (Harper & Brothers); 'Democracy and Monarchy in France,' by C. K. Adams; Gautier's 'Tour in Russia'; selections from Sainte-Beuve's 'Causeries du Lundi,' translated by W. F. Rae; 'Far from the Madding Crowd' (Henry Holt & Co.); 'The Common Frog,' by St. George Mivart; and 'Ismailia,' the narrative of the last expedition of Samuel Baker (Macmillan & Co.) We shall also have this season, through John Murray, the 'Last Journals' of Dr. Livingstone. To the foregoing must be added: 'The Mistress of the Manse,' a narrative poem by Dr. J. G. Holland; 'Notes of a Journey in 1873 in the Russian Province of Turkestan,' by Eugene Schuyler (Scribner, Armstrong & Co.); 'History of the United States Marine Corps,' by M. Almy Aldrich; 'Cattle—their Management and Breeding,' by Dr. Geo. B. Loring; 'The Cellar Door Club, and Other Stories,' by Edward Eggleston (Henry L. Shepard & Co.)

—The Massachusetts Historical Society will shortly be put in possession of a full-length portrait of Washington, copied after an original painting in the private gallery of Lord Albemarle. A letter from Mr. Robert C. Winthrop to the vice-president of the society states the circumstances under which this copy was obtained, and in regard to the original says that it was intended for the Stadtholder in 1780, but being entrusted to Laurens, then on his way to The Hague as minister plenipotentiary, it shared his fate when he was captured by Captain Keppel of the British Navy. Keppel gave the portrait to his uncle, Admiral Lord Keppel, and it has ever since been preserved at Quidenham Park, Norfolk, the seat of the Earl of Albemarle, the present head of the Keppel family. It is by an unknown artist, whose work was none of the best, and it derives its main interest, to use Mr. Winthrop's words, "from the fate which befell it; from the period of Washington's life at which it was taken; and from the broad blue ribbon which is so conspicuous a feature of his costume." This ribbon was already known, from Washington's Orderly Book at Cambridge, in 1775, to have been prescribed as the distinctive designation of the commander-in-chief, who was an entire stranger to his troops on his arrival. It is fitting, therefore, that so peculiarly a Massachusetts portrait of Washington should be preserved by the Massachu-

setts Historical Society, at least in fac-simile, for the making of which photography has been employed with great success.

—In the September number of *Blackwood's*, which once would have been a curious place for it, appears the latest of the many literary memorials of Mr. Sumner. It is in the form of a poem of forty-one quatrains by Mr. W. W. Story, an American writer best known to his countrymen as a sculptor, but known to some of them also as a practitioner of others of the fine arts, including poetry. One might say that there is an appropriateness in this latest of the Sumner testimonials in that it occupies a sort of vanishing boundary-line between a particular grief and the region of the general elegiacs. More than nine-tenths of it, in fact, might be used in memory of any one who had died regretted by all who knew him, and—which is the bad thing—might be so used because it has no closeness of application to any one or anything. It is, in short, an elegiac poem in memory of a personal friend, in which there is little traceable sign of personal grief and no recognizable view of the friend's personality, but all is vaguely declamatory on accustomed texts. For this and other reasons the poem takes its place among the clever, well-filed pieces of verse, ambitious, but made of stuff not stern enough, an examination of which has always left Mr. Story a step or two short of an excellent place. The poem before us ventures ambitiously to suggest for itself a very severe and high standard; for this time the poet sought to be imitated in the metre and in the line of thought is Omar Khayyam, as he appears in the impressive and really captivating version of the English translator. To some minds, our later poet will seem to strike much the same key of thought as his Persian predecessor: Death is inevitable and a mystery; beyond it is we know not what; it is to be mourned; Love cannot hold back its victims. But the difference between the new poem and the one which it calls to mind is mainly the difference between thoughts and sentiments common and of universal interest and, on the other hand, thoughts and sentiments common too and also of universal interest, but the expression of which must usually be platitudinarian, and is so here. Our poet laments the mystery of death in terms which will be recognized as commonplaceness itself; the Persian deals with problems equally unevadable, but of a dignity (as being eternally sure of human contemplation and eternally sure of baffling its unaided strength) which raises them to a level far different from that on which we find the ordinary meditations on death and the departure of friends. The older writer also reveals a majestic turn of mind and a profundity of sentiment which find proper expression in his verse, over which he is a master with a most skilful and various hand, and in his powerful diction. It is to be regretted that among the earliest imitations of his metre, as rendered by his remarkable English admirer and follower, there should be verses so unmusical as these and a diction so bald. There is between the poems one difference of which we have not spoken, but it relates primarily to the differing philosophy of the two writers. Omar is to the last eyeing the inscrutable; Mr. Story teaches that "since nothing we can know" it is best that at least we dream of happiness and endless progress in the other world, if another there be.

—The several Associations for the Advancement of Science held their meetings nearly at the same time this year in England, France, and the United States; and the presidential addresses in all three were by physicists (the chemist is now strictly a physicist), and all led up—directly or incidentally—to that ultimate question of what is to be thought about the cause of things. Mr. Tyndall's now famous "confession" that he feels bound to discern in matter "the promise and potency of every form and quality of life," has been held (seemingly with good reason) tantamount to the proposition that, so far as we can ever know or rightly think, "matter is the final cause." But it is to be noted that matter, under Tyndall's view, means matter plus force. So that, after all, his deliverance may amount to only this, that the potentiality of life and of the forms endowed with it is in Nature, which "is seen to do all things without the *meddling* of the gods," as his old friend Lucretius affirms and the science of the day is nearly ready to admit. The question how matter, or (as some would rather say) the system of things, came to have such "promise and potency," may still be asked, although Tyndall thinks it must ever be asked in vain. He seems even to imply that the question is illegitimate. With complete consistency, and a frankness that ought not to be blamed, he warns the religious world off the domain, not of natural science merely, but of knowledge altogether, allowing it instead free range over that of the emotions. What was once declared of the Samaritans, "Ye worship ye know not what," he extends to the human kind, with the further declaration that, from the very nature of things, it cannot be otherwise. President Wurtz, of the French Association, took for his theme "The Atomic Theory in the General System of the World." At this writing, all we know of his address is contained in a short extract, in which, while equally declaring the inscrutability of primary causes, he implies that somewhat may be inferred about them nevertheless. "They lie within a domain which man's intellect will ever strive to enter and search. So is man constituted, and such he will ever continue. . . . *Excelsior!* He will strive onward and upward, and in his innate instinctive conviction that things have not within themselves their *raison d'être*, their foundation and origin, he is gradually led to subordinate them to a primary cause, a unique and universal God."

—It is of this French Association, barely two years old, that Professor Lovering speaks, at the close of his own thoughtful address, as having already displayed a vitality and a prosperity which our own Association, in its opening manhood, has not yet acquired. Yet, if we may judge of the character of our American Association by that of its retiring President's address, now just printed, it is well performing its part. The thoroughness of its exposition of the principal problems in physical science, and of the means of attacking them, is equalled and relieved by its admirable lucidity. Our present reference to it must be restricted to a single paragraph, pertinent to the high question before us:

"In the phraseology of our mechanics we define matter and force as if they had an independent existence. But we have no conception of inert matter or of disembodied force. All we know of matter is its pressure and its motion. The old atom had only potential energy; the energy of its substitute, the molecule, is partly potential and partly kinetic. If it could be shown that all the phenomena displayed in the physical world were simply transmutations of the original energy existing in the molecules, physical science would be satisfied. Where physical science ends, natural philosophy, which is not wholly exploded from our vocabulary, begins. Natural philosophy can give no account of energy when disconnected with an ever-present intelligence and will. In Herschel's beautiful dialogue on atoms, after one of the speakers had explained all the wonderful exhibitions of nature as the work of natural forces, Hermione replies: 'Wonderful, indeed! Anyhow, they must have not only good memories but astonishing presence of mind, to be always ready to act, and always to act, without mistake, according to the primary laws of their being, in every complication that occurs.' And elsewhere, 'Action, without will or effort, is to us, constituted as we are, unrealizable, unknowable, inconceivable.' The monads of Leibnitz and the demons of Maxwell express in words the personality implied in every manifestation of force."

—Those who use tobacco and defend the use of it have now become so numerous that it requires some courage to make a stand on the other side. Especially is this the case in Europe, which, according to Professor Mantejezza, is fast being turned into a cigar divan, so that it is daily becoming more difficult for a man of average strength of mind to assert his liberty to refrain from tobacco if he goes into society at all. In other words, the weed is fast acquiring in social intercourse—for men at least—the same symbolic value which has from the earliest ages attached to wine, so that the "I never smoke" of the American teetotaler threatens to excite the same incredulity and to give the same offence as his "I never drink." In this state of things, Dr. Drysdale, senior physician to the Metropolitan Free Hospital, and physician to the North London Consumption Hospital, is of opinion that it is time for such practitioners of the healing art as have anything to say about tobacco to speak out. Speak out he does, accordingly, in a paper read before the British Medical Association at Norwich in August. To sum up his indictment against tobacco, he charged it with causing blindness, palpitation of the heart, paralysis, diarrhœa, and diseases of the teeth and the mucous membrane of the mouth and tongue. It might, he allowed, be used for the treatment of asthma, but he could not, as a leading medical journal had recently done, recommend it as a necessary for British troops in foreign service, thus classing it with the hygienic remedies useful in malarious and tropical districts; and to admit tobacco smoking, chewing, and snuffing into the list of the luxuries of a refined and wealthy age was, in his opinion, a violation of the laws of public hygiene. "Were the modern Turks or Germans," he remarked, "to go on smoking from morning till night as they do, and consuming Virginia tobacco or cavendish as we do in England, they would indeed present a deplorable spectacle of public want of stamina. Fortunately, however, German and Turkish tobacco is almost devoid of noxious properties."

—Every one is familiar with the rather coarse satire in which Swift represents Gulliver as asking the Laputan ghost-compeller to exhibit to him the ancestral lines of the various royal houses of Europe, when, instead of gazing upon a procession of awe-inspiring monarchs, he sees with surprise the motley spectral groups of simpering pages, rough swashbucklers, jolly monks, and vulgar grooms who accompany the royal mothers of the successive sovereigns. The idea is one so natural to a mind like Swift's that it would occur to few to doubt its originality; and yet there is a much older story which seems evidently to be the source from which he derived it. This is related in the 'Magica, seu Mirabilium Historiarum de Spectris et Apparitionibus Spirituum, etc.,' published by Henningus Grosius in 1597 for the edification of theologians and jurists. He quotes from the 'Proverbia Germanica'

of Johannes Agricola, as a well-authenticated fact, that a certain Johannes Teutonicus, the illegitimate son of a priest, so distinguished himself by his learning that he obtained a canonry in the Chapter of Halberstadt, in spite of the custom which reserved such preferment for the legitimate scions of noble houses. Naturally resenting this intrusion, the other canons shunned him. To rebuke their pride, he invited them to a splendid banquet, during which he took occasion to ask them whether they desired to see their fathers, and, on their eagerly assenting, he proceeded to evoke by magic the paternal spectres. The result was a procession of miserable figures—cooks, hostlers, peasants, and others, whose faces the guests acknowledged having seen in their fathers' houses. Then Johann summoned his own father, who appeared in the guise of a canon of agreeable rotundity, and his colleagues departed sadder and wiser men, who ceased thenceforth to reproach him with his lack of nobility. Perhaps some one better versed than we in folk-lore may be able to trace this story to a higher source of Aryan parentage; but it seems to us that Swift most probably borrowed the idea from Grosius or Agricola. This same Johann gave another specimen of his power by celebrating Mass on Christmas Eve of 1271 in three places, Halberstadt, Mainz, and Köln.

—The death of M. Guizot, which had been prematurely announced, took place on Sunday, the 13th inst., when he had nearly completed his eighty-seventh year. Like Thiers, he was a native of the South of France, having been born at Nimes, Oct. 4, 1787. His father was a lawyer of ability, who was taken off in the Terror, and this led to the widow's retiring to Geneva, where her son received his education. His literary career began early and in the field of history, and in 1812 he was appointed professor of modern history at the Sorbonne. The latest work on which he was engaged was a History of France for his grandchildren. In politics, his first manifestation was his pamphlet on representative government in 1816, his first active appearance in 1830, when he was elected to the Chamber of Deputies, and helped pave the way for Louis Philippe, who made him Minister of the Interior. He held this post but a few months. For nearly four years (1832-36) he was Minister of Public Instruction, being displaced by Thiers, with whom, however, two years later he formed a coalition. From 1840 till the Revolution of 1848 he was Prime Minister. Guizot owes his principal political distinction to his having faithfully represented the bourgeois element in French society, which governed France from the Restoration till 1848. Under the military régime which followed close on the excesses of the First Revolution, the literary and shopkeeper class failed to reap any of the fruits of the overthrow of the noblesse, and it was not until 1815 that they saw the long-wished-for consummation—"la carrière ouverte aux talens." M. Guizot came to the front rapidly as one of the most promising men of the new generation, and his rise and that of Thiers were among the signs of the times which inspired so much confidence in the future of France among even the shrewdest outsiders. The appearance of literary men in the foremost rank of politicians filled the souls of the middle-class all over Europe with joy and admiration. This class, too, could hardly have had a better representative than Guizot. His talents were striking and his morals pure to the point of austerity, and he had just the amount of liberalism the times called for. People in 1815 had not learned to expect much. Peace, economy, and the opening of high office to all without distinction of birth, were as much as they looked for. The three days of 1830 completed the triumph of the bourgeoisie and assured it, and brought M. Guizot into the front rank. He made a distinct failure as a diplomatist in England in 1840, where, in spite of the cordial greeting he received from society as a distinguished literary man, he was outwitted by the Ministry in the Syrian affair, but after his return home he resumed his old eminence both in the confidence of the King and in the Chamber. The coldness of his temper, the rigid Calvinism of his religious opinions, and the Whiggishness of his liberalism, however, made it impossible for him to see the necessity of any change in the political arrangements of 1830, and made him insensible to the corruption and feebleness of the Chamber, in which he was all-powerful. His use of the Government patronage, too, was only made pardonable by reference to his supreme confidence in the rectitude of his aims and his sense of their overwhelming importance. The Revolution of 1848 was generally considered to have wrought the ruin of his reputation as a politician, and he returned, though doubtless with reluctance—for he afterwards unsuccessfully sought election to the National Assembly—to his literary labors in his quiet home in Normandy. These were mostly historical, and his pen was down to the last very prolific. His fame as a writer, however, principally rests on the 'Lectures on the History of Civilization,' though everything he wrote was widely read. His religious feeling grew stronger as he grew older, and even, stern Protestant as he was, carried him into sympathy with the Pope in his conflict with the King of Italy. His last appearance as a polemical writer was in a controversy with Paul Janet, in the *Revue des Deux Mondes*, about three years ago, in which he stoutly defended the story of the fall of Adam and its theological consequences.

—A private dinner in commemoration of the battle of Wörth (August 6) was attended by Bismarck among others. There were no toasts, but the chief personage, who had imposed this as a condition of his being present, is said to have indulged his fondness for anecdote, and to have favored the company with a parallel between his meeting Napoleon at Sedan and the last time they had previously been together at St. Cloud, on occasion of Bismarck's return to Germany. In the midst of the then leave-taking, the minds of both being filled with forebodings of an approaching catastrophe, when the usual commonplaces concerning the journey had been exchanged, a painful silence ensued, which was broken only by turning the conversation upon—the weather. At Sedan, the Prince had ridden forward to meet the Emperor, who was riding towards him in a simple calash, and who, on seeing him, made the military salute, to which Bismarck hastened to respond, his arm brushing as he did so the hilt of his revolver in his breast-pocket, and causing Napoleon to turn as white as chalk. They alighted at the latter's request, that he might avoid public insult, at the house of a weaver, and, on being seated, the first question which Bismarck addressed him was whether peace could now be concluded. To this Napoleon replied that that depended on the Government at Paris. Again there came a painful pause in the conversation, and again it was broken by adverting to the weather. The circle was complete; but the forebodings of St. Cloud had given way to the afterthoughts of Sedan.

—The progress of native journalism in China is a noteworthy sign of the times. The success which has attended such seemingly risky enterprises as the *Shun Pao* and the *Chinese Mail* at the ports of Shanghai and Hongkong, to say nothing of their smaller imitators, has induced native capitalists to come forward with a view of still further meeting the unexpected demand which has arisen in Chinese circles for "news." The origin of the latest of these ventures is somewhat curious. It appears that the *Shun Pao* wrote very strongly in favor of a Cantonese actor, who, for the heinous crime of marrying a woman of respectable position in life (actors belong to one of the four degrees forbidden to compete in the examinations), was dragged before the Che-Hien, and, after being unmercifully flogged and otherwise tortured, was sentenced to a long imprisonment. The Cantonese, desirous of avenging themselves on the *Shun Pao*, at first threatened violence, and gravely debated the feasibility of sacking the office and practising upon the bodies of the editor and his compositors a series of those experimental tortures for which the Chinese are so unpleasantly distinguished. Happily, however, a wise man suggested that in place of using violence, the *Shun Pao* should be fought with its own weapons. The idea was received with acclamation, the capital was forthcoming in a trice, and, an editor and staff having been procured, the new paper was started with a guarantee of its expenses for a considerable term. Another recent incident at Hongkong proves in a different way that the Chinese are becoming sensible of the power and utility of journalism. Mr. Dennys, the editor of the *China Mail*, has been giving the provincial authorities of South China a somewhat rude shock. They have only lately discovered that the foreign press has for some years been in the habit of publishing translations of native official documents, a knowledge of whose contents was innocently supposed to be confined to the ranks of the Yamên officials. A short time since the journal in question published the foreign text of a confidential despatch from the Tsung-li-Yamên (signed by Prince Kung) to the Viceroy of the two Keang. In the innocence of his heart, the latter official deputed a subordinate to call at the *China Mail* office, and request the name of the native gentleman who furnished the Chinese text—this, too, in a manner which evidently showed that a refusal of the request was not even thought possible. It is needless to say that the intelligent native had to take his leave without the required information. As this is the first instance in the history of journalism in China in which the mandarin policy of indifference has been exchanged for an exhibition of interest, it is not without its significance.

SCHWEINFURTH'S TRAVELS IN AFRICA.*

THE interest in African travel has received a remarkable stimulus within the past ten or fifteen years from a variety of circumstances. One is the exhaustion of other fields of exploration, which has turned the most adventurous spirits towards this one, and has given us the explorations of Grant, Speke, Baker, Rohlfs, and Schweinfurth. Livingstone's travels grew, not unnaturally, out of his missionary labors; but the heroism with which

* 'The Heart of Africa. Three Years' Travels and Adventures in the Unexplored Regions of Central Africa, from 1868 to 1871. By Dr. Georg Schweinfurth. Translated by Ellen E. Frewer, with an Introduction by Winwood Reade.' New York: Harper & Brothers. 1874.

they were prosecuted begot an enthusiasm about African discovery of which we have yet to see the full results. Simultaneously with this growth of curiosity about Africa, there has been a remarkable accession to the means of gratifying it, as Mr. Winwood Reade has pointed out in the introduction to the volumes before us, in the entrance of Egypt into the class of civilized powers, and the extension of her territory south of the Nubian desert—the result of this being that a traveller about to penetrate into savage Africa, begins his journey many degrees south of the point at which he formerly took leave of civilization, and begins it with considerably greater resources. Though last, not least, we must mention the value which the discussions raised by the speculations of Darwin, Huxley, Tylor, and others have given to the details of savage life, which in all other parts of the globe are fast vanishing from our view, and which in the hands of competent investigators have lately been made to throw so much light on the origin of civilization and of many of the most perplexing social phenomena of our own day.

Dr. Schweinfurth differs from his recent predecessors in being an enthusiastic botanist, and consequently more interested in the African flora than in the fauna, but it is right to say that his book would, for popular use, have been greatly improved by the relegation of all the botanical matter to an appendix, and a cheaper and smaller edition, with this matter entirely omitted, would perhaps have been better still. He differs from them, too, as a scientific man might be expected to differ, in having, although a good shot, only a small amount of taste for hunting, and shows an amount of respect for the natives which is rather uncommon among African travellers. In fact, we could hardly describe him better than by saying that in his tastes and his philosophy he is the antipodes of Baker. Dr. Schweinfurth's explorations led him literally into "the heart of Africa," and into a region between 3° and 10° north latitude, which no previous traveller had touched. East of it, Baker had pushed down along the Nile to Lake Victoria Nyanza in 1863–4–5, and Burton and Speke had come up over the same route from Zanzibar in 1857–8. West and south of it, M. du Chaillu had made considerable explorations in 1863–4–5, starting from the Fernand Vas River, on the Atlantic coast. North of it, Dr. Barth had made great explorations from 1850–55, crossing the Desert to and from Tripoli; while, south and east of it, Livingstone had been wandering for years. Dr. Schweinfurth's means of locomotion, too, were peculiar, as he relied very little on his own resources, having put himself under the protection of a Nubian Mussulman trader making his periodical visit with the customary armed force to his "seribas," or factories, as such establishments used to be called before European nations began to colonize; and nothing in the book is more interesting than the Doctor's account of the relations of these traders to the Central African tribes. They are mostly Mussulmans and Nubians—a term which describes rather the region from which a man comes than the race to which he belongs, for the Nubian population is a great mixture of races. They traffic in ivory, slaves, and anything that is portable and seems likely to prove profitable, and are generally shrewd, pushing fellows, who enlist a few hundred men, much as the East India Company did for military service, in expeditions to the south. The troops are armed with indifferent muskets, and tramp along in single file, with the Turkish flag borne at the head of the column, followed by a body of negro bearers, who carry the supplies on their heads and shoulders, and bring back the goods found at factories and purchased or plundered on the way. Each trader, or company of traders, has his "seribas" at various points down in the interior, in which he leaves a small permanent garrison, protected by a stockade, and surrounded by a farm; and this garrison occupies itself in collecting ivory and other commodities, and raising such agricultural products as are necessary for its own subsistence. Every year or two the proprietor comes along with his little army, relieves the guard, and puts affairs in order, settles by fighting or negotiation any quarrels which may have sprung up with the neighboring chiefs, and makes his way back to the market in the north at Khartoum or elsewhere. His troops are by no means brave or well disciplined or numerous, and yet they march courageously all through the interior, overawing the native potentates, and plundering or kidnapping or making treaties or exchanging presents, as may seem most expedient. This military superiority is entirely due to the exclusive possession of firearms. Should the tribes in the interior become possessed of them, the whole business would be broken up, as no Nubian could be induced to enlist for service against them. The paths lie for the most part through thickets and forests, and would be utterly impassable by such troops in the presence of an enemy armed with muskets, as the British expedition against the Ashantees showed clearly. Dr. Schweinfurth gives one or two illustrations of the utter demoralization wrought among the Nubians by hearing that the tribe whose territory they were expected to traverse had begun to use powder and ball. The party with which he travelled was commanded by a man of apparently unusual morality and humanity, who on the whole traded honestly, and only fought in self-defence; but he tells enough of the doings of others to show what a shocking plague to the natives these expeditions are, how much burning, slaughtering, slave-catching, and cattle-lifting they do, and what a barbarizing influence they must exercise on African life; for the contact of savages with the dark side of civilization does undoubtedly, as we have seen in the case of our own Indians, degrade even them. Nothing, or next to nothing, can be done for the moral or material regeneration of Northern and Central Africa until the natives are delivered from the plague of Mussulman traders, and Lieutenant Cameron's suggestion, the pushing of cheap railroads into the interior from the coast, seems to be perhaps the best yet made on this point. Here would be a field in which even the sternest moralist would hardly object to seeing any number of Crédit Mobilier and Construction Companies at work, and for the successful cultivation of which the issue of bonds at almost any rate would be justifiable. On many routes such lines would unquestionably pay, and it would be a good while before the Niam-Niam or Monbuttoo Grangers began to groan under the tyranny of "the bloated bondholders" and "the heartless speculators."

Dr. Schweinfurth's pictures of life and manners in the heart of Africa—apart from the disorder and contamination wrought by the Mussulmans of the North—disorder and contamination which the extension of the Egyptian frontier has thus far aggravated rather than diminished—are, on the whole, exceedingly pleasing and even hopeful. They show an amount of progress in the arts among the population of the interior which makes its failure to advance farther almost as puzzling a problem as the immobility of the Chinese. We suppose no right-minded man, who has a proper sense of his own relation to the past and future, ever visits an ethnological museum and examines the weapons and tools with which the beginnings of our own civilization were wrought out, with which the rude forefathers of the Western World fought their hard fight with the terrible forces of inclement nature, without feelings closely allied to pity and admiration. How ingenious many of their devices were! How much patience and persistence they put into them, those poor fellows, with neither science, nor art, nor school, nor college, nor patent-office behind them! All over Africa we find in actual existence the very processes and implements for traces of which our own scientific men dig so laboriously, and which they treasure so carefully; and there also we find the beliefs and customs, hopes and fears and prejudices, of the early times, which, as recent investigations have shown, have left such deep marks on the manners, theology, metaphysics, and language of our own time. The tribes are numerous, but the type of culture is nearly the same for all.

"In the labyrinth of African culture," says Dr. Schweinfurth, "it is very difficult to disentangle the hundred threads which lead up to the centre from which they have all been unwound. Not a custom, not a superstition is found in one part which is not more or less accurately repeated in another; not one contrivance of design, not one weapon of war, exists of which it can be declared that it is exclusive property of any one race. From north to south, and from sea to sea, in some form or other, every invention is sure to be repeated; it is 'the thing that has been.' The creative hand of Nature alone produces what is new. If we could at once grasp and set before our minds facts that are known (whether as regards language, race, culture, history, or development) of that vast region of the world which is comprehended in the name of Africa, we should have before us the witness of an intermingling of races which is beyond all precedent; and yet, bewildering as the prospect would appear, it remains a fact, not to be gainsaid, that it is impossible for any one to survey the country as a whole without perceiving that high above the multitude of individual differences there is throned a principle of unity which embraces well-nigh all the population."

It would be possible to make a dozen articles filled with curiosities of African culture taken from Dr. Schweinfurth's descriptions of the four leading races whose territory he traversed, the Dinkas, Bongos, Niam-Niams, and Monbuttoos. The Dinkas make their hair straight by much combing, and give it a reddish tinge by continual washing with cow urine and the application for a fortnight of a pomade composed of dung and ashes. They consider it as effeminate and improper for a man to wear any clothing whatever as we should consider it for him to appear in petticoats. A clothed man is called contemptuously "a woman." Their cookery is very nice; they eat with more decorum than either the Turks or Arabs; eating separately and passing dishes from one to the other like Europeans. They took to knives and forks at Dr. Schweinfurth's table as if they had been bred to them. They are very fastidious, too, in the selection of their articles of diet. They are great smokers and enthusiastic lovers, almost worshippers indeed, of their cattle, the breeding of which is their principal occupation. The Dyoots, a neighboring tribe, salute each other by mutual spitting. They are great iron-workers; they fish and hunt and breed cattle; but their principal object of ambition is the possession of a well-stocked poultry-yard and a good dog. The women do all the work in the fields as well as the work of the house. Love of children and reverence for age are more strongly developed in this tribe than in any other in Central Africa. All the tribes cultivate and love tobacco, and call it by some modification of the American name, showing

that it is of foreign origin. The common tobacco and the Virginian are the two varieties cultivated, and it will be disheartening to the anti-smokers to hear that "no production more than this has trampled over every obstacle, and that even Africa has allowed Virginian tobacco to penetrate to its very centre," though it is doubtful whether the common tobacco, the *nicotiana rustica*, is not of native origin. All the tribes have elaborate smoking contrivances, and many chew.

The Bongos live on a red ferruginous soil and are very red themselves. Their territory produces great quantities of mushrooms, of which they make sauce like our catsup; they are tremendous smokers and chewers, make the tobacco up in cakes like our "cavendish," and carry half-chewed quids behind their ear, like a clerk's pen. They are disgusting feeders, with a great love of garbage and vermin. They are expert iron-workers. With their rude bellows and a hammer which is oftener than not a round ball of pebble-stone, an anvil of gneiss or granite, and a pair of tongs composed of a split stick of greenwood, "they contrive to fabricate articles which would bear comparison with the productions of an English smith." They are enthusiastic lovers of music, which is mainly imitative. The women are good potters and good tanners—tan having found its way in through the Nubians. The men wear a skin or two, but the women nothing but a wisp of grass plucked in the woods every morning. Wives are purchased, and no child not at the breast is allowed to sleep in the same hut with its parents—a custom which some European and American Bongos would do well to imitate. The old people are suspected of witchcraft. The insane are treated by dipping in a river, and persons suffering from "general debility" are made to eat the flesh of Gallukoo, which we take to be a bird, with a detestable flavor. The Mittoo wear iron ornaments with lavish profusion as a sign of wealth, just as New York women wear gold and jewels.

The Niam-Niams, who are the leading race of Central Africa, tall, well-formed, intelligent, warlike, live under a government less despotic than the other tribes. Their chiefs are really limited monarchs, whose revenue consists in a royalty on ivory and half the meat of all elephants killed. The women are much more shy and retiring than the Bongo or Mittoo women, and avoid male strangers, and are the objects of unprecedented devotion on the part of their husbands. The Nubians turn this affection to account in their raids. If they capture a Niam-Niam woman they know that they can extract anything from the husband by way of ransom. But they are cannibals, and when people find themselves growing fat amongst them their lives are filled with anxiety. Fore and hind quarters of man may be seen hanging up in their huts and on the adjacent trees. They brew and drink enormous quantities of beer, made from a cereal known as "raggi" in India. The authority of the chief is absolute, but they skulk in battle. The war-cry of the tribe is "Meat! meat!" indicating the fate that awaits the conquered enemy. They are good iron-workers, wood-carvers, basket-makers, and potters. They salute by hand-shaking, in such a way as to make the joints of the two middle fingers crack. They are proud of large families, and punish adultery with death. They are very fond of music, and play on a kind of harp, and have wandering minstrels, who improvise; their language contains no equivalent for a god or prayer. They practise divination through a piece of board, very like the article called "planchette" so much in use a few years ago among superstitious Christians in this country. A four-legged stool with a smooth seat is made from a particular kind of wood. A smooth block of the same wood is then taken and is rubbed on the top of the stool, the latter being previously sprinkled with a little water. If the rubbing is easy, all will go well; if difficult, there is trouble impending. Dr. Schweinfurth was received by the principal monarch of this people, Munza, in a wooden hall one hundred feet long, forty feet high, and fifty broad. There was an older and longer one near by, but this was out of repair. The king wore a plumed hat, a large number of copper ornaments, and a skin apron. A few days later, in celebrating a victory, he stepped down from his throne and danced a frantic *pas seul* for two hours in the same place in the presence of his eighty wives, who sat on low stools applauding vigorously—an amusing picture of the vanities of savage life.

South of the Niam-Niams are the Monbuttoo, also a fine race, of Niam-Niam blood. Their women do the farm-work, while the men hunt and do the iron-work. Both sexes make baskets and carve wood. The women enjoy great independence, manage all the household affairs, and appear to be in all respects on an equality with the men; but polygamy among them is unlimited, adultery common, and the demeanor of the women revolting. "Not a few were openly obscene." The men were dressed in drawers made of skins, but the women go entirely unclothed. The Monbuttoos are generally particular about their food, but are, in spite of their high degree of culture, shocking cannibals. The bodies of the slain in battle are divided on the field, and carried home and dried for future consumption, and Dr. Schweinfurth once came upon the most revolting scene of which we have ever read, the preparation of a portion of the human body for the pot by some young women. "But, with it all, the Monbuttoo are a noble race of men—men who display a certain national pride, and are endowed with an intellect and judgment such as few natives of the African wilderness can boast—men to whom one may put a reasonable question, and who will return a reasonable answer. The Nubians can never say enough in praise of their faithfulness in friendly intercourse, and of the order and stability of their national life."

The question which we have already mentioned, and which must suggest itself to anybody who reads these volumes, why people who have made as much advance in civilization as some of the tribes our author here describes have not made more, he answers as follows:

"There is an utter want of wholesome intercourse between race and race. For any member of a tribe which speaks one dialect to cross the border of a tribe which speaks another is to make a venture at the hazard of his life. Districts there are, otherwise prosperous in every way, which become overpopulated, and from these there are emigrations which entail a change of pursuits, so that cattle-herders become agriculturists, and agriculturists become hunters living on the chase; districts again there are which shelter the remnant of a people who are resisting oppression to the very verge of despair, and there are districts which have been actually reduced to a condition of vassalage and servitude."

This answer, however, is not complete. It leaves unexplained the fact that civilization has not been wrought out in Africa as elsewhere by the ascendancy of the tribe of highest capacity over its inferior neighbors, resulting in the formation of an orderly and growing political community. Society has started everywhere, so far as our knowledge goes, under the conditions now present in Africa, but it has everywhere else gradually thrown them off through the rise into power of some clan possessing extraordinary capacity for civilization. In other words, the fittest has everywhere else got the better of the others, and either rooted them out or absorbed them.

Dr. Schweinfurth's account of the Akka or pigmy race, whose confines he nearly reached, and many members of which he saw, is what has perhaps attracted most attention to his book. It is, though meagre, of exceeding interest to the ethnologist, and goes far to strengthen the theory which the author holds, that the aboriginal population of Africa, of which the Akka and Bushmen are the surviving specimens, were men of diminutive stature, of limited intelligence, difficult articulation, and great manual dexterity, who were gradually dispossessed by tribes of larger mould. That this is probably true of Europe and America, and undoubtedly true of India, has long been an inference from popular legends which have received a good deal of confirmation of late from historical and scientific investigation. But the little men of European myths, like the "black man" of the Indian myths, is always a malevolent, tricky creature, who delights in annoying and injuring his betters, who hate him savagely. The Akka, on the other hand, though keen hunters, great archers and spear-throwers, and wonderfully mischievous and cruel, are said by Dr. Schweinfurth to be regarded as a kind of amusing pets or protégés by the Monbuttoo and Niam-Niams. Any extracts from this portion of the book would do it injustice. We cordially commend the whole of it to the perusal of our readers.

MASSON'S WORDSWORTH, SHELLEY, KEATS.*

OF the six essays contained in this volume, four are old and have already appeared in print, while two, those on Keats and Shelley, are new. The essays are so much above the level of periodical literature, of which we believe they originally were a part, that they deserved the permanent form here given them. And apart from their merit, there is this other reason besides for republishing them—namely, that Professor Masson intends issuing a complete and revised edition of his critical essays, and this volume is the first of the new set. The second volume is to be the 'Chatterton,' which is known in this country from having been reprinted ten or twelve years ago. As regards this same revision, it is clear that Mr. Masson needs to have a few words spoken to him; in this volume, he has been rather slovenly about it. For example, it is bad editorship to insert in the new essay on Keats, and at the same time retain in the old one on Wordsworth, the very similar remarks about the best poetical study of the external world. The point made is one well worth making: The critic selects as a characteristic mark of a certain school of poets whom the example of Wordsworth had called to the study of nature, that they seemed to think that nature consisted altogether in vegetation; they made themselves wearisome with continual lush grasses, meshed ivy, laburnums, roses, lilies, and much other persistent, wordy botany; they seemed to know little of any aspects of nature save such as could be seen on Hampstead Heath. Mr. Masson incidentally suggests that a good designation for this knot of writers would have been Hampstead Heathen, and we mention the suggestion because it is one of Mr. Masson's

* 'Wordsworth, Shelley, Keats, and Other Essays. By David Masson M.A., LL.D. New York & London: Macmillan & Co. 1874.

habits to enliven his essays by familiar and facetious terms much like this that we have quoted. However, he proceeds to illustrate the difference between the Wordsworthian way of conceiving of nature and the way of which Leigh Hunt, as much as anybody else, set the fashion. The illustration is forcible. The first passage is Wordsworth's description of a boyish skating scene:

> "So through the darkness and the cold we flew,
> And not a voice was idle: with the din
> Smitten, the precipices rang aloud;
> The leafless trees and every icy crag
> Tinkled like iron; while far-distant hills
> Into the tumult sent an alien sound
> Of melancholy, not unnoticed, while the stars,
> Eastward, were sparkling clear, and in the west
> The orange sky of evening died away."

The second passage is quoted from Keats, who, although vastly more than a botanical poet in his natural scenery, nevertheless in his early works furnishes by the hundred perfect examples of vegetation in excess. He cannot be said in doing it to do what other poets more fully identified with the school have done, and that is, make it evident that the pettiness, or daintiness, or fastidiousness, or whatever we are to call it, of the imagery employed was a true argument of a sort of feminity and affectedness and general pettiness of nature in the poet. It is in Leigh Hunt again that this is easiest seen—though of that critic and poet it is necessary to say, and all the more necessary inasmuch as he can be so irritating, that there is no reader of our poetical literature who is not often as truly his debtor as a thirsty traveller to the friend who points him to a new or a forgotten spring. In the lines from Keats, in which the poet describes the spot where Cupid watches Adonis at the command of Venus, there is, we may be sure, nothing of Wordsworth's frozen lake ringing beneath the open winter sky, orange in the west and sparkling in the east with stars; of the iron-branched trees, or the distant mountain sending a solemn, alien sound into the midst of the nearer din; on the contrary, we are enclosed from the mighty face of Nature within a somewhat unwholesome growth of greens:

> " . . . Above his head
> Four lily-stalks did their white honors wed
> To make a coronal; and round him grew
> All tendrils green, of every bloom and hue,
> Together intertwined and tram'elled fresh:
> The vine of glossy sprout; the ivy mesh;
> Shading the Ethiop berries, and woodbine,
> Of velvet leaves and bugled blooms divine;
> Convolvulus in streakèd vases flush;
> The creeper, mellowing for an autumn blush;
> And virgin's bower, trailing airily;
> With others of the sisterhood."

As we have said, the substance of Mr. Masson's line of criticism on these opposed poetic methods appears twice in the revised essays, which seems a mistake. The critic thinks, however, that his distinction between Nature and Nature botanized is one which more than any other needs dinning into the modern youthful poetic mind, and this belief of his may plead in justification. The repetition looks clumsy, however; the more particularly as the distinction, which so far as we know has been more consciously and more forcibly preached by Mr. Masson than by other dissatisfied critics, has been by him presented in the Keats essay with all due emphasis and skill.

A habit of Professor Masson's which some of his readers do not find agreeable, is of more obvious consequence to his style than his free-and-easy way of being impressive. This is his habit of bringing together before the reader's eyes not only the one or two personages whom he wishes to exhibit, but also numerous others besides who happened to be alive at the same time, or at some time nearly the same, or, indeed, at some time not at all nearly the same; and alive also in the same place, or some near place, or some place not near, who may somehow be attached to the central figure by ties direct or indirect. Though often exclaimed against, some vestiges of this to us confusing way of composing a picture these essays still show; as the one on Shelley, and as in the case where, by reason of Lord Jeffrey as a boy having once seen Burns, and Burns's life having extended so far that he was born while James Thomson was still living, we have a grouping in the coincidental manner of all literary Scotchmen from David Hume to our contemporary Carlyle. The essay in which this historical painting is set up displays another of Mr. Masson's characteristics—his Scotticism, which is fervent. His subject in the essay is "Scottish Influence on British Literature"; but what he really does is to enquire at length—and if with hearty patriotism yet with candor—into the roots and reasons of that *perfervidum ingenium* about which so much has been said. He details the causes which have tended to make the Scot a highly individualized person—as, for example, his small country, so often needing defence against a powerful neighbor, and the defence of which bred the will and the pugnacity which lie at the basis of an independent character; his interest in religious topics, which his mysterious and often terrible storms and mists increased at the same time that his wild and changeable surroundings bred doubt in him; his love of controversy, leading so nearly into the realm of out-and-out bitter dogmatism—in short, there is a good deal of philosophizing, the result of which is that Mr. Masson reduces the *perfervidum ingenium* of his countrymen to a habit of "emphases" intellectual or moral, or both. This seems to leave us much where it found us—that is to say, if we are Scotchmen, enquiring without uneasiness what good thing exactly it was that was meant by the phrase-coiner; and if we are not Scotchmen, tolerably contented with the belief that the *perfervidum ingenium* in the case of good Scotchmen means intellectual and moral energy without very much of intellectual or moral repose; while in the case of some other persons, it may mean pragmatical conceit, selfishness, and other qualities which, as the Japanese preacher remarks to his hearers at the close of his sermon, "may no doubt be found among people inhabiting the more distant parts of India and China." That some such are found near Arthur's Seat Mr. Masson does not hint, though he admits that there are foreigners whose opinion of the Scottish national character would not be fully defined by the term "emphasis."

The book may fairly be described as instructive and entertaining reading, and it has one particular merit which makes it in our opinion a valuable elementary work for any young man or woman entering upon the study of literary works—or, let us say, of literature. Moved probably by the exigencies of his position as a rhetorical professor at Edinburgh, and moved, perhaps, also by that function of the *perfervidum*, etc., which induces Scotchmen either to classify and systematize all things earthly and heavenly, or else die, Mr. Masson has paid great attention to certain literary questions of primary importance—real or formal. One of these questions, for example, is where to draw the shadowy line of demarcation between the spirits of prose and of poetry; how to determine what is the appropriate verbal dress for this or that subject, and consequently how the true law may be observed or transgressed. All this Mr. Masson discusses with class-room lucidity and more than class-room ability. His book may do little to settle problems like this; but it will lay them out before many minds in a form more apprehensible than they usually assume on their first appearance, or indeed their steady recurrence, to the minds of youthful enquirers.

A defect which is not of an importance to correspond with the importance of the good quality which we have mentioned is the fact that while Mr. Masson is usually a sensible writer, generally taking safe and well-trodden critical roads, like Audrey, the gods did not make him poetical, nor endow him with any very exquisite degree of literary taste. The reader cannot be absolutely sure that a well-seasoned remark on Milton may not be followed by praises of the vagarious "impassioned prose" of Jean Paul, the cold limbs of whose buried little ones, touching his soul, he tells us, on a certain occasion, removed its blots as dead hands cure eruptions of the skin.

HENRY BEYLE.*

STENDAHL was a most singular character, but nothing surely in his destiny was so singular as having Mr. Paton write his life. Beyond his good-will and his industry, we are unable to perceive that the biographer has a single qualification for his task, and we should be curious to know whether it was undertaken spontaneously or to order. In speaking of the author's admirable 'Chroniques Italiennes,' and by implication of his masterpiece, the 'Chartreuse de Parme,' Mr. Paton remarks that Beyle was here quite off his beat, and that what he *might* have done was something in the "pleasant, gossiping manner of Louisa Mühlbach"! In his review of his hero's works, Mr. Paton devotes eleven pages to that forgotten fragment, the 'Vie de Rossini,' and not a line to this same 'Chartreuse de Parme,' now recognized as Beyle's chief title to the attention of posterity. Of the smallest capacity to appreciate the author either on his moral or intellectual side Mr. Paton is strikingly guiltless. He regards him as a shrewd, amusing, eccentric gossip, determined to have his laugh at everything, and to offer his readers at any cost a light, frothy entertainment—a judgment about on a level with his speaking incidentally of the "naïve Dutch realism of Balzac." A critic who finds Stendahl amusing and Balzac "naïf" must be left to his own devices. Mr. Paton is, as a commentator, quite worthless, and as a writer sadly slipshod and vulgar. We have seldom seen a book more in need of a complete revision, both as to matter and to manner. It contains hardly an opinion which is not ludicrously erratic, and hardly a quotation, a foreign phrase, or a proper name which is not misspelled and misprinted. But the author writes with a garrulous *bonhomie*—that of an easy-going cosmopolite, well advanced, apparently, in years—which will soften the edge of the reader's displeasure; and he is to be thanked at any rate for bringing Beyle once more before the world, and giving occasion for that final sifting and summing up of opinion which the world finds it constantly more needful to practise expeditiously towards all claimants for permanent attention. But it seems, we

* 'Henry Beyle (otherwise De Stendahl). A Critical and Biographical Study. By Andrew Archibald Paton.' London: Trübner & Co. 1874.

repeat, the crowning stroke of that something perverse and melancholy which pervaded all Stendahl's career, that these last proceedings in judgment should take place in an English court and be carried on in English—and in English in which Mr. Paton has a voice. Beyle was the most French of Frenchmen, but he spent half his life in Italy, lauding the Italians and denouncing his countrymen. He caused "Arrigo Beyle, Milanese," to be inscribed upon his tombstone, and he falls victim, thirty years after his death, to a biographer who discourses upon him in a strange, slovenly English, flavored with Scotch and interlarded with disfigured fragments of French and Italian. By denying that he was the flippant feuilletonist represented by Mr. Paton, we do not mean to intimate that he was a dull writer. He is always interesting and often divertingly so, but his merit, to our sense, is not in his powers of entertainment, greater or less, but simply in his instinctive method. What this method was, and how instinctive it was, is suggested by this passage in a letter to his sister, written in his twenty-first year:

"I like *examples*, and not, like Montesquieu, Buffon, and Rousseau, systems. . . . Help me to know provincial manners and passions; describe me the manners in the drawing-room of Madame ———. I need examples and facts. Write quickly, without seeking fine phrases. . . . Contribute to my knowledge of women, facts, facts! I have a passionate desire to know human nature, and a great mind to live in a boarding-house, where people cannot conceal their real characters. . . . Borrow and read Sallust; you will find there thirty superb characters."

Later, he advises the same young lady to make a list of the good and bad passions, and then to write opposite each category a description of such examples as she had observed. By perseverance in this course, she would find that she had discovered treasures of knowledge of human nature. It was this absorbing passion for example, anecdote, and illustration that constituted Beyle's distinctive genius, and is the ground of the fresh claims put forth on his behalf by his recent eloquent apostle, M. Taine. Beyle felt, as soon as he began to observe, that character, manners, and civilization are explained by circumstances, and that in the way of observing and collecting circumstances there was a great work to be done. He devoted himself as far as possible to doing it, and on the whole, with his profound mistrust of systems, left the theory of the matter very much to take care of itself. M. Taine follows, with a genius for theory, and erects a symmetrical system on Beyle's unordered *data*. It is interesting to observe that in his attempts to theorize, Beyle is always flimsy and erratic; and that in his attempts to collect small facts in the manner of Beyle (as in 'Monsieur Graindorge'), M. Taine is generally ponderous and infelicitous.

The only value of Mr. Paton's volume is in its disinterring a good many obscure facts of Beyle's personal history, and, in particular, in its offering us a number of extracts from the copious and intimate correspondence which he carried on in his early years with his sister Pauline. With his genius for observation, fortune led Beyle, happily, to see a good deal of the world. He was born at Grenoble in the year 1783. His father occupied an honorable position in the law, but his means were moderate, and Beyle's money-troubles were unceasing to the day of his death. In his own line, he had a fine start in life in having opportunities for close observation of the great Napoleonic drama. He obtained by family influence a cavalry commission in the army, and afterwards occupied some responsible posts in the commissariat. He was at the battle of Marengo and in the retreat from Moscow (as the reader of any given five pages of his writing will not fail to discover). He also discharged various small administrative functions in Germany. In his Italian campaign, he formed that passion for Italy and all things Italian which provided him with the occupation of a lifetime. He returned to Milan in 1811, and from that time to his death made repeated visits, of varying duration, amounting in all to more than twenty years. His last ten years (though he died while on leave of absence in Paris) were spent as consul to Civita Vecchia—a passion for Italy cherished certainly under difficulties. He died in 1841. Mr. Paton will enable an ingenious reader to construct a tolerably vivid personal portrait. After the fall of the Empire, Beyle was continually poor, and his habits and tastes demanded money. His writings were not popular, and have come into favor since his death. He was extremely ugly, with a coarse, corpulent, plebeian ugliness. Mr. Paton says characteristically that by one of his friends "some rather offensive" traits are mentioned—"for instance, he wore stays." This is certainly not an Anglo-Saxon custom for gentlemen, but, except that, as Beyle was very fat, tight-lacing may have often been uncomfortable to him, we are at a loss to see to whom, besides himself, it was "offensive." Mr. Paton adds that the same witness, whose name he misprints, pronounces him "a *gentilhomme sans blason*," and translates the phrase "a would-be gentleman, without armorial bearings." It means, of course, the direct reverse—a real gentleman, though he could show no arms. This judgment affords some relief to the reader's imagination, which, by reflecting much upon Beyle's poverty and his ugliness, has found itself unable to view in as graceful a light as is desirable his unremitting and somewhat pretentious love-affairs. It is an especial ill-fortune for Beyle that his relations with women and his views on the whole matter of love should be presented for judgment at an English tribunal, unaccustomed to dealing either with such temperaments or with such opinions. Beyle's temperament was apparently the French temperament in a highly exaggerated form; and as for his opinions, they are scattered through all his writings, and especially embodied in his voluminous treatise 'De l'Amour'—his masterpiece, according to Mr. Paton, but to our taste that one of his books which, with the exception perhaps of 'Le Rouge et le Noir,' comes nearest to being absolutely unreadable. As is generally the case in regard to this matter in the lives of men of genius in which it plays a part, we know at once too much and too little. We know with more or less accuracy the number and succession of the ladies to whom these gentlemen have been devoted, and we know their published philosophy of such devotion, but we are not able, for want of a general light, to appreciate justly either the weak points in their philosophy or the strong points in their conduct.

Stendahl was apparently very industrious, though he worked in a desultory and disjointed manner, wrote (or published, at least) because he had to do so for bread, and affected to be as little as possible a littérateur by profession. He ought to have considered, however, that the character was made honorable by the danger which he persisted in fancying attached to it. He published everything under a false name (he had half a dozen), travestied his own on his tombstone, and is known to fame by a disguise. He professed an entire indifference to literary fame, except as consisting in mere conciseness. He boasts that the 'Chartreuse de Parme' is written in the style of the Civil Code. He borrowed largely, especially in his early writings, and transferred long passages from other books without acknowledgment. One may say roughly that his subject is always Italy. He had a number of affectations, but his passion for Italy is evidently profoundly sincere, and will serve to keep his memory sweet to many minds and his authority unquestioned. This subject he treated under a number of different forms; most successfully, toward the end of his life, in a novel which will always be numbered among the dozen finest novels we possess; in a number of short tales, founded on fact, and extracted from the manuscript archives of Italian families, of many of whom Stendahl purchased the privilege of transcribing for a certain number of mornings in their libraries—just as in some parts of the Rhineland one may obtain for a small fee the right to spend an hour in a vineyard or orchard, and retire carrying as much fruit as possible about one's person, as the phrase is; and in a series of loosely connected notes, descriptive, reflective, anecdotic, and epigrammatic, on monuments and pictures, manners and morals (such as 'Rome, Naples et Florence' and the 'Promenades dans Rome'). To these last may be added his 'Histoire de la Peinture en Italie' and various pamphlets—the 'Vie de Rossini' and 'Racine et Shakspeare.' The 'History of Painting' is an ambitious name for a string of desultory though often acute and suggestive dissertations on matters nearly and remotely connected with Italian art. It is no history, and, with much suggestiveness, it has to our mind little value. Stendahl as an art-critic is inveterately beside the mark, and it is striking evidence of the development of the science of taste within the last forty years that with his extreme "sensibility," as he would call it, and his excellent opportunities for study, he should seem to us nowadays to belong to so false a school.

The letters placed in Mr. Paton's hands by Beyle's family, and unfortunately offered us here only in translated and condensed extracts, add much to our sense of intimacy with our author, but help us little to understand him better. He was a strange mixture of genius and pretension, of amiability and arrogance, of fine intuitions and patent follies. He condemned his genius to utter more foolish things than it seems to us a wise man was ever before responsible for. He practised contempt on a wholesale, a really grotesque scale, and considered, or pretended to consider, all mankind an aggregation of "*sots*," except a small class endowed like himself with "sensibility." We have spoken of his method; it was excellent, but we may say on the whole that it was better than any use he made of it—save only when he wrote the 'Chartreuse de Parme.' His notion was that *passion*, the power to surrender one's self sincerely and consistently to the feeling of the hour, was the finest thing in the world, and it seemed to him that he had discovered a mine of it in the old Italian character. In the French, passion was abortive, through the action of vanity and the fear of the neighbors' opinion—a state of things with which he is never weary of expressing his disgust. It is easy to perceive that this doctrine held itself quite irresponsible to our old moralistic canons, for *naïvété* of sentiment in any direction, combined with great energy, was considered absolutely its own justification. In the 'Chartreuse de Parme,' where every one is grossly immoral, and the heroine is a kind of

monster, there is so little attempt to offer any other, that through the magnificently sustained pauses of the narrative we feel at last the influence of the writer's cynicism, regard it as amiable, and enjoy serenely his clear vision of the mechanism of character, unclouded by the mists of prejudice. Among writers called immoral there is no doubt that he best deserves the charge; the others, beside him, are spotlessly innocent. But his immorality seems vicious and harsh only according to the subjects he handles. 'Le Rouge et le Noir,' 'L'Amour,' and certain passages in his other writings have an air of unredeemed corruption—a quality which in the novel amounts to a positive blight and dreariness. For the rest, Stendahl professed a passionate love of the beautiful *per se*, and there is every reason to suppose that it was sincere. He was an entertaining mixture of sentiment and cynicism. He describes his heroes and heroines in perfect good faith as "sublime," in appearance and fact, in the midst of the most disreputable actions, and it seems to him that one may perfectly well live a scandalous life and sit up half the night reading Dante in a glow of pure rapture. In repudiating Mr. Paton's assumption that he is a light writer, we would fain express that singular something which is fairly described neither as serious nor as solemn—a kind of painful tension of feeling under the disguise of the coolest and easiest style. It is the tension, in part, of conceit—the conceit which leads him with every tenth phrase to prophesy in the most trenchant manner the pass to which "les sots" will have brought things within such and such a period—and in part of aspiration, of deep enjoyment of some bold touch of nature or some fine stroke of art. This bespeaks the restlessness of a superior mind, and makes our total feeling for Beyle a kindly one. We recommend his books to persons of "sensibility" whose moral convictions have somewhat solidified.

A Treatise on Food and Dietetics. By F. W. Pavy, M.D., F.R.S. 8vo, pp. 574. (Philadelphia: Henry C. Lea. 1874.)—In this volume Dr. Pavy discusses the physiology of food in the light of modern scientific discovery, while at the same time he avoids the error, into which recent writers on this subject are so prone to fall, of attaching undue importance to scientific observations which really cover only a portion of the subject, and of overlooking the empirical results arrived at by the daily experience of life. Although in his remarks on the dynamic relations of foods the author seems to have scarcely mastered the question in all its bearings, yet this portion of the work is on the whole satisfactory, and well repays perusal. The important part played by nitrogen in the animal economy, and the relation of nitrogenous and non-nitrogenous food to muscular force, are well explained and exemplified by a detailed account of the classical experiment of Feck and Wislicenus, and of the more recent observations of Parkes; and incidentally the conclusions drawn by Flint from his observations on Weston, the pedestrian, receive a very able criticism. The author's position as leader of that school of physiologists who regard the formation of sugar in the liver as entirely a post-mortem phenomenon, seems unfortunately to have led him to ignore many recent investigations, all tending to show that the liver is to be regarded as a storehouse where a starch-like substance, derived from various sorts of food, and known as glycogen, is accumulated during digestion, and afterwards given out in the form of grape-sugar as the necessities of the body may require—the liver, according to this view, performing an analogous function in the animal economy to that of tubers and bulbs in the vegetable world. The absence of all reference to this important advance in physiology is perhaps the most serious defect in the whole work.

Dr. Pavy's list of alimentary substances is a very long one, and includes much interesting information about articles which are only exceptionally used as the food of man. It is very satisfactory to find the relative digestibility of the various articles stated without reference to the tables drawn up by Beaumont as the result of his observations on Alexis St. Martin, for these tables, though expressing only the time during which the various substances remained in the fistulous stomach of the Canadian, have been too often regarded as furnishing complete information on the question of comparative digestibility. The portion of the volume which treats of dietetics contains much useful information, not the least important of which is the list of dietaries in the principal hospitals of Great Britain. On the whole, this work may be regarded as the best of its class in the English language, though, in view of the works of Smith and Letheby on the same subject, we must take exception to the somewhat uncourteous remark in the preface, that "no modern systematic treatise of the kind here presented exists in the English language."

A Manual of Mediæval and Modern History. By M. E. Thalheimer, formerly Teacher of History and Composition in the Packer Collegiate Institute, Brooklyn, N. Y. (Cincinnati and New York: Wilson, Hinkle & Co. 8vo, pp. 480.)—Miss Thalheimer's manual of mediæval and modern history is marked by the same excellences as her manual of ancient history; and we do not hesitate to pronounce it the best school text-book, covering the same ground, with which we are acquainted. Its principal fault, too, is that which we pointed out in the earlier work—an excessive amount of detail. This would be no disadvantage where the instruction is properly done; but most teachers in this country have no higher standard of teaching than to require every word to be learned by heart, proper names, dates, and all. A good teacher will know how much of this matter the pupils ought to commit to memory, and with such the book will be found interesting and suggestive. An average teacher will use it only to load the pupils' minds with a mass of to them useless lumber. The arrangement is as good as could be expected in so very difficult a field, and would perhaps be unequivocally good if the editor had used more cross-references and had introduced more abundant chronological tables. Take, for example, the Byzantine history, p. 56, where a distinct reference back to p. 42 would make the connection clear, reminding the pupil of Michael the Drunkard and the republic of the Paulicians; for an ordinary school-boy will not stop to look these names up in the index. Again, the period of the Crusades has a very lucid and convenient arrangement, bringing in the "Guelfs and Ghibellines" and "England and France" separately after the general sketch of the Crusades; but the period which follows (to the Discovery of America) lacks this unity and simplicity. It would have been better to have chosen some one country, say France (or the Church), as a centre for the general sketch, keeping it quite distinct from other countries, and then followed it up, as is done, with special sections.

The book is remarkably free from typographical and other errors, but we notice a few discrepancies and trifling errors in the maps. Thus, in one map, the French spelling of Strasbourg and Luxembourg stands with the German Mentz and Coblenz. Again, Argovie and Thurgovie for purely German cantons; Heidelburg, Nuremburg, Luzerne, Besancon, Alançon. The maps are excellent, twelve in number. There are good and perhaps sufficient genealogical tables; chronological tables might, however, be advantageously added. A useful feature is the Recapitulation at the end of each section.

The Poems of Virgil. Vol. I. The Pastoral Poems and first Six Books of the Æneid. Edited by J. H. and W. F. Allen and J. B. Greenough. (Boston: Ginn Brothers. 1874.)—This volume is in keeping with the high character of the editors' previous publications. It is not too much to say that with the appearance of their 'Latin Grammar' in 1872 began a new era in the study of the Latin language in America, and perhaps there is no more encouraging token of the condition of classical scholarship among us than the cordial and intelligent welcome so generally extended to this advanced manual. Their edition of 'Selected Orations of Cicero' in 1873 was superior to any which the American student had before had. A practical application of the best results of Latin scholarship and of general philology, and a clear conciseness of statement, pre-eminently characterized both works, and these are the qualities which give to this edition of Virgil its great merit. The wealth of comment which has accumulated about the language and thoughts of their author the editors seem to have thoroughly examined, without, however, sacrificing a practical and independent spirit peculiar to themselves. Wherever a diligent learner would be likely to have doubts about Virgil's exact meaning, or to be puzzled by the idioms or subtleties of the Latin, there the editors appear with ample help, or, at least, with a clue to the solution. We have been particularly pleased with the synopses of thought which precede and accompany each portion of the poems.

In purity of the Virgilian text, we think that this school-edition will be found in advance of any of its predecessors. But as the book is designed especially for young students of Latin, the wisdom of its discrepancy in matters of orthography may be doubted. Among such discrepancies are, in the first Eclogue, *fines* and *finis*, both in the accusative plural; *formosus* and *formonsus*, in the fifth Eclogue; and with about equal frequency in the Æneid, *humidus* and *umidus*. Though it be conceded that such varieties of form existed among the scholars of the Augustan age, and even that so painstaking an author as Virgil wrote the same word in different ways, we very much question the expediency of troubling beginners with such points. Recent investigations have, indeed, materially modified the conventional orthography which has come to us from Latinists of the fifteenth century, but the whole question is still such an open one—even among veteran scholars—that tyros ought not to be bewildered with it. At the least, those editors who would incorporate such matters in a school-book should give a synoptical statement of its orthographical peculiarities rather than assume that the book will be read in course with a memory tenacious of pertinent notes. In fairly instituting any change from the conventional to the historical

method of spelling Latin, the distinction in form between vocal and consonantal *i* and *u* should certainly be abandoned. Another slight defect in this edition is the marking of certain passages as spurious, or of doubtful authenticity, without a statement of the reasons therefor. The ordinary reader of Virgil—in whom little familiarity with textual criticism can be presumed—resents, as a species of sacrilege, any apparently arbitrary interference with the traditional text, while the school-boy gazes only vacantly at the mystic brackets.

In the second volume of this edition we are promised, not only the Georgics and the remaining books of the Æneid, but also the too much neglected minor poems attributed to Virgil.

Physiology for Practical Use. Edited by James Hinton. (New York: D. Appleton & Co. 1874.)—Displeasing as much of the deluge of "popularizing" books of science may seem to the more strenuous student, he must simply bow his head, and instead of protesting content himself with discriminating and picking out the best. This being the case, we think Mr. Hinton's treatise is to be recommended as conveying a great deal of useful information in clear and untechnical words. It is true that the chapters are desultorily strung together, and that the subject is made easy by an almost complete omission of reference to the experimental methods by which the results given have been ascertained. Thus the work has hardly any educational value. We think the reading, on the one hand, of such a book as Huxley's 'Elementary Lessons,' and, on the other, of some popular book on hygiene, were it even nothing better than Black's 'Ten Laws of Health,' would be more profitable, because more systematic, and would take no longer time. But our minds nowadays are getting intolerant of any but desultory, scrappy reading. Professor Agassiz used to say that no man could understand more of a generalization than his knowledge of particulars would cover: no particulars, no intelligence whatever of the general theory. The proposition is not always absolutely true, but we feel strongly its force in reading the first chapter of Mr. Hinton's book, probably written by himself, on 'The Brain and its Servants.' A reader whose only knowledge of the nervous system came from this account of its functions, its inhibitions, its sensibilities, and its various degrees of automatic and voluntary performance, all expressed in vague theorems with nowhere a concrete analytic experiment—such a reader's notions would indeed be strangely wild and dim. Still the book, as far as it goes, is accurate and very readable. Some will object to the frequent moralizing of the editor. We ourselves do not. The chapters on alcohol, on the ear, taking cold, ventilation, headache, and sleeplessness are good. Here is an extract with which we may close:

"Hydropathy has at all events made one thing popular, namely, that people do not necessarily catch cold from sleeping in wet bandages or even wet sheets if proper precautions are adopted. These precautions consist in placing a sufficient amount of dry clothing over that which is wet to prevent any feeling of chilliness from being experienced by the patient. Here is a principle not to be lost sight of; should it be one's misfortune to meet with a damp bed under circumstances in which no other is to be had, let all available coverings be placed over it, or at least to the extent that the person who occupies it shall feel warm and comfortable. He may then defy the damp and sleep in security."

RECENT GOVERNMENT PUBLICATIONS.

Forty-third Congress, First Session. House of Representatives. Report No. 259. Cultivation of Timber and Preservation of Forests. March 17, 1874. 8vo, pp. 120.

At the meeting of the American Association held at Portland in August, 1873, a committee was appointed to memorialize Congress in reference to the wasteful destruction of American forests, and the importance of arresting it, not only with respect to the future supply of timber, but also on account of the effect upon the climate of the country. This committee, consisting of Mr. George B. Emerson of Boston, and Dr. Franklin B. Hough of Lowville, N. Y., proceeded to Washington during the past winter, and presented to the Secretary of the Interior the memorial referred to. This was favorably endorsed by the Commissioner of the General Land Office, and then transmitted to the President, who made it the subject of a special message to Congress, whereupon it was referred to the Committee on Public Lands, by whom this report is made. After a comparison between our former and present supply of timber, the Committee give the percentage of woodlands in various countries, and proceed to a critical consideration of some of the forest tracts of the United States, especially the pine forests of Michigan. Lumber statistics follow, as furnished by the census, and an estimate is attempted of the ratio of consumption of timber for various purposes—as, for railroads, fences, bridges, fuel, etc. The effect of forests upon rivers and water-courses is next considered, and a note of warning raised as to the result of indiscriminate clearing of the ground, especially in mountainous regions, upon the distribution of the rain-fall, producing freshets on the one hand and stages of low water on the other; and the experiences of various nations in this respect are cited. Several essays by Dr. Hough, who has paid particular attention to this matter, are given in the work, which forms an excellent synopsis of the present state of our knowledge on the subject. A copious alphabetical index makes it possible to refer at once to any particular topic. The Committee on Public Lands recommend the appointment of a competent Commission of Enquiry, upon whose report Congress can adopt such remedial and precautionary measures as may be found expedient.

PEEPS AT OUR SUNDAY-SCHOOLS. By Rev. Alfred Taylor. 12mo, price $1 25. Sent by mail on receipt of price.

Full of interest to the friends of Sunday-schools. The author carries you with him on his visit to the schools, and makes the trip an exceedingly lively, pleasant, and profitable one. In his preface he says:

"As you go with me to look at the Sunday-schools, and we enjoy our brief glimpses at them, please to remember that these pages are not meant to contain finely soun theories or didactic disquisitions on what a Sunday-school ought to be, but rather pictures of what our schools are."

HARPER'S CATALOGUE. The attention of those designing to form libraries, or increase their Literary Collections, is respectfully invited to Harper's Catalogue, which comprises a large proportion of the standard and most esteemed works in English Literature—*comprehending over three thousand volumes.*

Librarians, who may not have access to a trustworthy guide in forming the true estimate of literary productions, will find this Catalogue especially valuable for reference.

The Catalogue is arranged alphabetically by the authors' names, anonymous works by their titles. The index is arranged by the titles of the books, besides having numerous appropriate heads, each general head being followed by the titles of all works on that subject.

Harper's Catalogue sent by mail on receipt often cents.

THE LIFE OF CHRIST.

By the Rev. F. W. FARRAR, D.D., F.R.S.,

Master of Marlborough College, and Chaplain-in-Ordinary to the Queen.

IN TWO OCTAVO VOLUMES, PRICE $7.

Lest the readers of the *Nation* should be misled by the narrow criticism which appeared in a late number, we offer for their inspection the following extracts from a few of the many favorable reviews already received. In fact the *Nation* is the only publication in this country which has as yet, as far as we are aware, given anything but a favorable notice of this truly valuable work.

THE SEVENTH EDITION was issued in England last month, though the book was only published on the 15th of last May!

From the GUARDIAN.

"We have in every page the results of an intimate acquaintance with the literature bearing upon his great subject, while the quotations and references in the notes more especially intended for the learned reader, substantiate the author's claim that, 'without intending to be exhaustive or specially erudite,' his pages 'contain much that men of the highest learning have thought and ascertained.' . . . We pass to our Lord's teaching. In no department of his difficult work, we think, has Dr. Farrar more strikingly displayed his literary ability than in the skill with which he has condensed the larger discourses of Christ, *e.g.*, the 'Sermon on the Mount,' and brought out their salient points, with a clear apprehension of the meaning of his words and the impression they made on those who heard them. No part will be read with greater pleasure or advantage."

From JOHN BULL.

"It would be very difficult to name any book written since the days of Bishop Jeremy Taylor that brings forth so many precious treasures of different kinds in the interest of religion as in these pages, which combine the charms of a most fervent and brilliant eloquence, well sustained from the first to the last, with a profound knowledge of Greek scholarship, of classical antiquity, of mediæval legends, of Rabbinical doctrines, of Oriental customs."

From the LITERARY WORLD.

"That a solid and learned yet eloquent and graphic summary of the things which are most certainly believed among us concerning the Christ of history, should have had a run greater than any book since Macaulay's 'History,' is a remarkable fact. We do not say it is impossible that such a book could have been written in France or Germany, and have met with the same reception there, but we think it exceedingly unlikely, and we state this with some knowledge of both countries. The heart of the country is, we should hope, sound on the most vital question of all, or a great publisher would not have given the commission, and a writer of Dr. Farrar's repute would not have given so much time and thought, for the preparation of a work of this kind, at once popular and learned. Its success is the best answer to those who think that a good thing needs the patronage of a religious society to ensure its reception by the public. Every one should read this book."

From the N. Y. EVENING POST.

"The book will be a prize to all students and no less to every Christian believer. It overflows with information not easily attainable elsewhere, and for clergymen, Bible-class and Sunday-school teachers, and all others who have to instruct or would themselves be instructed, it will prove a mine of stimulating and suggestive knowledge. Dr. Farrar has done in this work very much such a service to Christian readers and thinkers as was done by Messrs. Conybeare and Howson in their admirable 'Life of St. Paul.' Of course this statement needs qualification. No human hand can draw for us the portrait of the Master with that grasp and comprehensiveness with which we may hope to see delineated the lives of his Apostles. But we do not believe modern criticism has yet given to us a volume combining so many excellences of arrangement, grouping, and detail, such accuracy of statement and such glow of language, such careful and extended research and such singular grace and beauty of style, as that which lies before us in this work of the Master of Marlborough College."

From CHURCH AND STATE.

"This is one of the noblest contributions of the present day in defence and confirmation of the Gospel of Christ. Whether viewed in its theological or literary aspects, it is highly to be commended; and it will go far to remove the too frequent reproach cast upon English and American scholars and divines, as being unable to produce anything of note themselves, and as relying almost entirely upon translations from the German. The work is unusually full and exact, and it leaves almost nothing to be desired by the reader."

From the London TIMES.

"Dr. Farrar's qualifications for this great work are in many respects eminent. As a distinguished linguist, he is capable of appreciating, as few men can, the results of textual criiicism; as an accomplished scholar, he is familiar with all the illustrations which literary knowledge can bring to bear on the subject; while, as an earnest divine, he is keenly alive to the spiritual significance of the words and deeds he is narrating. . . . The value of the book, in reference to sceptical objections, will be that it exhibits, in a most favorable form, the aspect which the life of Christ bears when regarded from an orthodox point of view. No thoughtful mind will rise from the perusal of this book without feeling that it reveals a beautiful and a harmonious conception. It will serve to raise the mind from mere objections in detail to a comprehensive view of the whole subject, and it will at the least assist candid objectors to do justice to the Christian tradition. . . . Dr. Farrar has been able to present, in a more accessible form than before, a combination of the traditional, critical, and philosophical comments which have been made on the narrative. . . . Dr. Farrar, as we have seen, assumes the usual Christian interpretation, and his book is the most brilliant and learned exposition of it which is accessible to the modern English reader. It is full of passages not merely of beauty, but of nobility of sentiment."

From the DAILY TELEGRAPH.

"Space does not permit us to notice as they deserve the abounding notes which show the brilliant scholarship of their author, and present on almost every page matter for study and reflection to the cultivated reader. Enough if we say that the simple and unlearned Christian will find in this new life of his Master edification and delight; that the sceptic will read it with none the less attention because he and his opinions are treated with chivalrous respect; and that the scholar will give it an honored place among the works which best elucidate the all-important matters of which it treats."

From the STANDARD.

"Regard the book from what point of view we may, it stands almost alone as a life of Christ, both in beauty of style and in completeness."

From the CHURCHMAN.

"We find here a most striking example of what Archbishop Whately calls the 'use of imagination in history.' Every event is pictured with the skill and power of a true artist. The real scene and all the actors stand clearly revealed before us. We behold what seems to almost all minds the far-off past as the living present. The thousands of years and of miles which separate us from the time and the land of the historic Gospel are forgotten, and we are brought face to face with that wonderful, that beautiful and perfect life which the Incarnate One lived here among men.

"The author has also embodied this picture-narrative in a style which for finish and eloquence has seldom been equalled by any modern English writer. It glows with true fire, throbs with the kindling fervor of an enthusiasm which must touch and thrill the heart of every devout reader."

From HARPER'S WEEKLY.

"Those who are acquainted with Dr. Farrar's sermons, published by Messrs. E. P. Dutton & Co., under the title of 'The Silence and the Voices of God,' will welcome a new work from his pen, 'The Life of Christ,' just issued by the same house. The unlearned reader will prize it for the clearness and simplicity of the narrative, while the learning and the patient, intelligent spirit of research displayed in the notes, will commend it to the favor of scholars. It is avowedly written from the standpoint of a believer, and while it avoids a controversial tone, its tendency is to counteract the influence of authors like Renan and Strauss."

From the CHURCH JOURNAL.

"It will, in our opinion, take the place in our day which Jeremy Taylor's 'Life of Christ' filled in his. In scholarship, in criticism, in learning, it is abreast with our time. But it stands among modern lives alone for its deep piety, its reverent spirit, and especially its wealth of illustration and splendor of rhetoric. In these last the spirit of the Bishop of Down seems to live again."

From the NONCONFORMIST.

"Except in translations from the German, we have no life of Christ which at once embodies the results of modern Biblical science, and commends itself to those who retain a hearty faith in the Gospel Christ came to be and to teach, . . . It was, therefore, a happy thought which led the publishers to resolve on issuing a life of Christ, which, while it embraced the most recent discoveries of Biblical science and criticism, should address itself to the general reader, and place them at his command. A scholarly yet popular life of Christ was much wanted by the thousands who teach in our schools, and by the tens of thousands who now read and study the Gospels for themselves. This want has been met, met fully and admirably, by the Life now before us."

From the BRITISH QUARTERLY REVIEW.

"Affluent as has been the Christological literature evoked by Strauss's first 'Leben Jesu,' and manifold as have been its forms, there was room for the kind of biography that Dr. Farrar has here supplied. Discarding all prolegomena, and restricting his collateral matter to notes and an appendix of excursuses of some fifty pages, Dr. Farrar simply tells the great Gospel story, addressing himself to the popular rather than to the learned mind. He is, however, thoroughly qualified by general scholarship and by special study for justifying the conclusions that he reaches and the views that he propounds; so that while popular in form and eminently readable, his scholarly basis and reasons are adequately indicated, either in the inlaying of the text or in the foot-notes."

From the London BOOKSELLER.

"There is no English work on the subject to be compared with this book of Dr. Farrar's, and it is safe to predict that for a long time to come it will stand alone as the English 'Life of Christ.'"

From SCRIBNER'S MONTHLY.

"Almost unannounced, and certainly without any parade of advertisement, Messrs. E. P. Dutton & Co. have given to American readers a work which in some ways takes at once the highest rank in modern Christology. It is impossible for us to give a detailed examination of the two volumes before us, but perhaps we may give the best general characterization of it when we say that it is at once popular and learned, at once devout and broad. It is a book for the people in the best possible sense; and so its style is simple and easy and attractive to an extraordinary degree. For the most part it is narrative and historical; and it has this very important excellence, that each word is picturesque and effective, suggesting some detail which is essential to the completeness of the story, but which would embarrass the recital of it, if it were drawn out at length. From first to last, the human interest of that mortal life which began at Bethlehem is continuously and impressively exhibited—and that without a strain of effort or the least unnaturalness of emphasis. The detailed and fragmentary materials which the Evangelists have furnished are illustrated, explained, confirmed, by all that modern scholarship and research can command, and are woven with seeming artlessness, but with consummate art, in a continuous narrative, in which the divine tone of the Gospel text is never lost, nor the divine color of the sacred picture ever faded. With a careful study of proportion and of order, both of time and of importance, we have the story of the childhood and manhood of the Lord Jesus told us about as fully and completely as we can expect ever to have it told. . . . The book must take its place at once in the very front of that department of literature to which it belongs."

BY THE SAME AUTHOR.

THE RIVERSIDE PRESS, CAMBRIDGE,

Have now ready:

GREEN'S CRIMINAL LAW REPORTS.

CRIMINAL LAW REPORTS: Being Reports of Cases determined in the Federal and State Courts of the United States, and in the Courts of England, Ireland, Canada, etc. With Notes by N. St. John Green. 8vo, 770 pp., sheep, $7 50.

The decisions on this subject have never been brought together, but are scattered through the various series of Reports in such a manner as to be inaccessible to the great body of the profession. This volume contains cases determined mainly in 1873 and 1872, some being issued in advance of their regular publication elsewhere.

"I look with great satisfaction on the publication of leading criminal cases under the auspices of Mr. Green. Criminal law requires a much more thoughtful and scientific discussion than it has as yet received; and no one is better calculated to aid in this work than Mr. Green, and from no one can more valuable services in this department be expected."—*From Dr. Francis Wharton, Author of 'Wharton's Criminal Law.'*

Nearly Ready:

Recently Published:

CHITTY ON CONTRACTS. A Practical Treatise on the law of Contracts not under Seal, and upon the usual Defences to Actions thereon. By Joseph Chitty, Jr. Eleventh American, from the Ninth English Edition. In 2 vols. 8vo, $15. Much enlarged by Hon. J. C. Perkins.

This latest and best edition of 'Chitty on Contracts' has met with a rapid sale since its publication last spring, and has elicited many commendations from members of the bench and bar, as well as from the press.

"I am very much obliged to you for sending me the Eleventh American Edition of 'Chitty on Contracts.' I have frequently examined it, and am impressed with the fulness and accuracy of the notes and citations recently added. I especially notice the arrangement and clear, large type of its copious Index. Indeed, the typography, quality of paper, and binding of the whole work is a step in advance in the printing of American Law-Books, for which I thank you."—*From Hon. James D. Colt, Judge of the Supreme Judicial Court of Massachusetts.*

"I find the additions to it of great value which have been made by the English editor, and the notes and new chapters which have been prepared with his usual thoroughness by Judge Perkins, render the work one of great importance to every American student."—*From Hon. Charles Devens, jr., Judge of the Supreme Judicial Court of Massachusetts.*

THE GATES OF THE BAPTISTERY AT FLORENCE.

BY LORENZO GHIBERTI.

Published by the Yale School of the Fine Arts.

1874.

A handsome portfolio, 18 × 22 inches, containing thirty-four photographic prints, with descriptive text. This publication of photographs from the Bronze Doors of the Baptistery at Florence has grown out of the acquisition, by the Yale School of the Fine Arts, of casts from the original work, including the whole design as it stands in position at the eastern entrance of San Giovanni. The main designs, photographed in sections, are prefaced by a portrait-head of Ghiberti and the three bronze doors of the Baptistery in the order of their dates, and are followed by a view of the eastern door with its surroundings. The photographs are handsomely mounted on tinted card-board. Price $30.

Third Edition, Revised, Corrected, and brought down to Sept., 1874.

In oblong book form, bound in neat boards, for handy reference, . Price 50 cents.
Mounted on rollers, ... Price

OPINIONS OF THE PRESS.

"The 'Statistics of the World,' by Professor Alexander Schem (G. J. Moulton), sustains the favorable reputation of that useful work. The compiler has brought his own high personal authority to the preparation of the work, combined with an intelligent use of the most recent sources of information, forming a series of reports concerning the government, population, and commerce of the different countries of the world, together with a variety of miscellaneous statistical facts, which can hardly be found elsewhere in so narrow a compass or with so little expense of time and money."—*New York Tribune.*

"Altogether, the compilation by this famous statistician is exceedingly valuable, and the enterprise that has accomplished it cannot be too highly commended.—*New York Evening Mail.*

"I have examined a chart of the 'Statistics of the World,' by Prof. Schem, and consider it a highly valuable compilation. As a supplement to the different geographical text-books in use, it could not fail to prove of great importance to the teachers of our grammar schools, each of which should be supplied with a copy of the work."—*Henry Kiddle, City Superintendent.*

"As a work of reference for writers, politicians, and others, most valuable."—*New York Evening Post.*

KEETELS'S ELEMENTARY French Grammar. 1 vol. 12mo, $1 25.

ALBERT MASON, Publisher,
NEW YORK.

NEW BOOKS.

THE PROPHET: A Tragedy. By BAYARD TAYLOR. 1 vol. 12mo, $2. In this dramatic poem, based upon the earlier history of Mormonism, Mr. Taylor portrays very effectively the scenes and circumstances in which the "prophet" saw visions and at length attained full assurance of his mission. The delineation of varied characters is admirably distinct; the corrupting influence of ambition and self-indulgence is depicted with graphic force; while the unconscious sublimity of woman's pure love and loyalty is touchingly revealed.

BOYESEN'S GUNNAR. $1 50.

"A love-story of Norwegian life, of wonderful freshness, the very breath of nature in its pages. It has the charm of Björnson himself, and is true poetry in prose."—*New York Evening Mail.*

WALKER'S THE INDIAN QUESTION. $1 50.

"What shall we do with the Indian? Those who wish a considerate and noble-minded answer to the various forms of this question can hardly do better than to turn over the pages of this book. It is, indeed, a book of uncommon value."—*Christian Union.*

JAMES R. OSGOOD & CO., BOSTON.

CHAPTERS ON ANIMALS. By PHILIP GILBERT HAMERTON. With Twenty Etchings by J. Veyrassat and Karl Bodmer. One volume, uniform with 'The Intellectual Life.' Price $2.

"Of the books of the present season, it is safe to say it would be hard to find one more thoroughly enjoyable than 'Chapters on Animals,' by Philip Gilbert Hamerton, with twenty etchings by J. Veyrassat and Karl Bodmer. It is almost gilding refined gold to add to the charm of Hamerton's perfect style these wonderful etchings, which alone are worth the price of the volume. . . . His 'Intellectual Life' was the most shining success of the past season. He writes of animals with as quiet a persuasiveness, as thorough a sympathy, as he bestowed on 'The Pleasures of Thought and of Study.'"—*New York Tribune.*

PUBLISHERS AND IMPORTERS,
17 MURRAY STREET, NEW YORK,
Have Just Published:

THE WORKS IN PROSE AND Verse of the Rt. Hon. John Hookham Frere. With Memoir by Sir Bartle Frere. Second edition, with Additions. 3 vols. crown 8vo. Handsomely printed, with numerous Head and Tail Pieces and Initial Letters, and two Portraits on steel by Jeens. Price $7 50.

Contains Frere's Translations of Aristophanes, from Theognis, the Poem of the Cid, Homer, Catullus, Lope de Vega, etc., etc. The Monks and the Giants, a Poem by Robert and William Whistlecraft; Contributions to the Anti-Jacobin (The Loves of the Triangles, The Rover, etc.), etc., etc. Minor Poems.

"They are works of the best literary art. They reproduce the essential characteristics of the Aristophanic comedy in such a manner that from their perusal the English reader not only may obtain a truer conception of the genius of the Athenian playwright than any but the most intelligent and thorough students of the original derive from the Greek itself, but also finds himself charmed with the plays as pieces of English composition, and contributions to English comedy."—*C. E. Norton in North American Review.*

"One of the most accomplished scholars England has produced, and one whom Sir James Mackintosh has pronounced the first of English translators."—*Ticknor's History of Spanish Literature.*

THE WEEK IN TRADE AND FINANCE.

SEPTEMBER 14, 1874.

THE money market has remained easy, with the rate standing at 2 to 3 per cent. for call loans. There are no indications of any improvement on rates, the banks and financial institutions being as greatly encumbered as ever with surplus funds, which they have been unable to loan out at anything like paying rates. For commercial paper there is a quick market, with very little offering. We quote the market as follows: 6½ to 7½ for prime names having 3 to 4 months to run, and 5 to 6 per cent. for that running 60 days and under.

Cable advices on Thursday reported the Bank of England rate of discount unchanged at 3 per cent., and a gain of £260,000 in the bullion of the Bank.

The weekly statement of the Clearing-house banks of this city, issued on Saturday, was slightly unfavorable; it compares as follows with that of the previous week:

	Sept. 5.	Sept. 12.		Differences.
Loans	$279,084,900	$280,867,800	Inc..	$1,782,900
Specie	18,891,300	19,863,100	Inc..	971,800
Legal tenders	65,604,700	65,325,900	Dec..	278 8 0
Deposits	234,746,000	237,882,500	Inc..	3,136,500
Circulation	25,662,400	25,605,700	Dec..	56,700

The following shows the relations between the total reserve and the total liabilities:

	Sept. 5.	Sept. 12.		Differences.
Specie	$18,891,300	$19,863,100	Inc...	$971,800
Legal tenders	65,607,100	65,325,900	Dec..	278,800
Total reserve	$84,496,700	$85,189,000	Inc..	$693,000
Reserve required against deposits	58,686,500	59,470,625		
Excess of reserve above legal requirem't	25,809,500	25,718,375	Dec..	91,125

The stock market during the week was active and the prevailing feeling generally "bullish." The efforts to advance prices have been mainly directed towards a few stocks, such as Union Pacific, Lake Shore, and Western Union, the improvement in which ranged between 1¾ and 3¼ per cent. New York Central was strong upon the usual declaration of its half-yearly dividend of 4 per cent., coupled with the announcement that in future the dividends upon the stock would be paid quarterly, 2 per cent. every three months. The movement in Union Pacific has assumed important shape, and there is no end to the rumors which have been set afloat relative to the heretofore unknown intrinsic value of the stock. The most important statement, which comes from the "great operator" himself, Jay Gould, is that the road earned its interest for the entire year during the first eight months, and that the net earnings, after paying operating expenses, during the last four months of the fiscal year, will be applicable to the payment of dividends on the stock. The "talk" among the bulls is that by the 1st of January the price of Union Pacific will be 50, and by July next 75 will be low for it, as by that time payment of regular dividends will have been commenced. While there may be some doubt as to the correctness of these predictions, there is no doubt whatever upon one point, and that is, that extraordinary efforts are being made to advance its price, and that a sufficient amount has already been purchased by the bulls, which would, in ordinary times, have been sufficient to have worked the stock up to 40. The weak spot in the market has been C., C. and I. C., which fell off to 8. The "Granger" stocks—Milwaukee and St. Paul, and Chicago and Northwestern—have also been a drag upon the general market, speculation in which has been feverish, owing to pending litigation regarding them in the Wisconsin court.

The market to-day opened strong and buoyant, particularly in Union Pacific, which during the day advanced to 34½; Lake Shore, which sold up to 75⅝, and Western Union, which sold at 80⅜. The balance of the list advanced from ¼ to ½ above the closing prices of Saturday. In the afternoon, the "Granger" stocks took a sudden jump, St. Paul going from 32½ to 34, and Northwestern from 36 to 38⅜, upon the false announcement that the Wisconsin court had made a decision in the railroad suits favorable to the roads.

The following shows the highest and lowest sales of the leading stocks at the Stock Exchange for the week ending Saturday, September 12, 1874:

	Monday.		Tuesday.		Wed'day.		Thursday		Friday.		Saturday.		Sales.
N. Y. C. & H. R..	103	103⅜	103⅞	104⅜	104	104⅞	104	104½	104⅜	104⅜	104	104½	33,005
Lake Shore	73¼	74	74⅜	75	74⅜	75¼	74⅝	75⅛	74½	74⅜	74¼	74⅜	132,235
Erie	34¼	34⅜	34⅝	34⅞	34⅜	34⅜	34⅜	34⅞	34	34¼	34	34⅜	20,400

Government securities have been quiet, with prices fractionally lower, in sympathy with the weakness of the gold premium. The demand for bonds has been extremely light, both for home and foreign account. The following are the closing prices this evening:

	BID.	ASKED		BID.	ASKED
Registered 6's, 1881, c	117⅛	118	Registered 5-20's, 1867, c	116¾	116⅞
Registered 5-20's, 1862, c	112¾	112⅞	Registered 5-20's, 1868, c	116¾	117
Registered 5-20's, 1864, c	115⅜	115⅝	Registered 5's, 10-40's, c	111¾	111⅞
Registered 5-20's, 1865, M and N	115⅝	116	Registered 5's of 1881	111⅞	112⅛
Registered 5-20's, 1865, J. and J.	115⅞	115⅞	U. S. Currency 6's	117⅛	117⅝

The principal feature in the railroad bond market was the sharp decline in the bonds of the C., C. and I. C. R.R. Co., the First Mortgages of which sold down to 70, and the Second Mortgages to 23, against 81 and 60 respectively, the prices they were selling at previous to the default in payment of interest. Union Pacific bonds were strong, especially the Incomes, which advanced from 80 to 88 during the week. The better class of railroad bonds are in very good demand, a marked preference being shown for them by investors over any other securities now offering. The New Jersey Central consolidated bonds, recently offered to the stockholders at 90, are in demand at a premium of 3 to 4 per cent. over subscription price. $3,000,000 New York Central and Hudson River Consolidated 7 per cent. bonds have been recently negotiated abroad at 105.

The gold market exhibits continued dulness; the extreme figures have been between 109¾ and 109⅞, the market closing on Saturday at the lowest point of the week.

The following shows the range of quotations:

	Opening.	*Highest.*	*Lowest.*	*Closing.*
Monday, Sept. 7	109¾	109¾	109¾	109¾
Tuesday, Sept. 8	109⅞	109¾	109¾	109¾
Wednesday, Sept. 9	109¾	109⅞	109¾	109¾
Thursday, Sept. 10	109¾	109¾	109¾	109¾
Friday, Sept. 11	109¾	109¾	109¾	109¾
Saturday, Sept. 12	109⅞	109⅞	109⅞	109⅞

The specie shipments for the week were unimportant in amount—$723,000, consisting mostly of silver bars.

NOTICE TO THE HOLDERS OF THE FIRST-MORTGAGE BONDS OF THE OREGON AND CALIFORNIA RAILROAD.

The undersigned Trustees are prepared to purchase, for the Sinking Fund, a certain amount of the First Mortgage Bonds of the Oregon and California Railroad Company, and hereby invite offers of such bonds from holders.

The lowest offers will be accepted up to the amount of the available means which are derived from the sale of the Company's lands; but no proposals above par and accrued interest in gold will be considered.

Communications stating amount and price of bonds, and marked "Offer of Oregon and California Railroad Bonds," may be addressed to the undersigned, care of the London and San Francisco Bank, San Francisco, California.

MILTON S. LATHAM,
WILLIAM MORRIS,
FAXON D. ATHERTON, } Trustees.

SAN FRANCISCO, Sept. 1, 1874.

FOR LAWYERS AND POLICY-holders.—Advice and Calculations in Life Insurance and Life Contingencies.
DAVID PARKS FACKLER, Consulting Actuary, 320 Broadway, New York. Elevator at side door.

SPECIAL NOTICES.

TERMS: In advance, one insertion, four cents per word; five insertions, three cents per word, each. The enclosure of a stamped and addressed envelope will secure a numbered box, to which communications may be addressed.

Ventilation of Schools for both Comfort and Profit. Advice and Plans. Correspondence free. L. W. LEEDS, Engineer, 110 Broadway, New York.

A Young Lady desires a situation to teach the lower English branches in a public or private school, or as visiting teacher. Unexceptionable references. Address TEACHER, 39 South Portland Avenue, Brooklyn.

An experienced Classical and Mathematical Teacher, Scholar, and Gold Medallist of foreign University, desires to establish a school in which the thorough drill of English Public Schools would be given. Takes private pupils. Prepares for scientific schools and college (English or American). Highest city reference. Address TUTOR, 29 West Fifteenth Street, New York.

A Visiting Governess, accustomed to teach English, French, and German, has spare hours. Address Box B, *Nation* Office.

SPECIAL NOTICES.

A Harvard Graduate, Private Tutor in Cambridge, wants a pupil for the coming College year. Has experience and city references. Address Box 16, *Nation* office.

A Graduate of Harvard College would like two or three Pupils to fit for College or otherwise. Best references. Address Box 17, *Nation* office.

A Vassar Graduate of three years' experience in teaching, desires a situation in a select school. Refers to the Faculty of Vassar College. Address, Box 15, *Nation* Office.

A Class for Young Gentlemen, and Private Instruction. Circulars sent on application. THOMAS R. ASH, 17 East Sixteenth Street.

Excellent Governesses for Families in abundance. Please address "TEACHERS' AGENCY," Rev. L. W. Applegate, Mauch Chunk, Pa.

Teachers Wanted for Schools. Address AMERICAN EDUCATIONAL UNION, 737 Broadway, N. Y.

The Nation.

NEW YORK, THURSDAY, SEPTEMBER 24, 1874.

The Week.

THE New Orleans revolution has come to an end within the past week, McEnery and Penn surrendering to the United States immediately after the proclamation of the President calling upon the rebels to disperse. Kellogg was at once reinstated, and the time has since been occupied by the discussion of a proposed compromise between the Conservatives and the Kellogg party. The United States forces still remain in New Orleans, and the orders given for the concentration of other troops in Louisiana have not yet been countermanded. The history of events in detail has been this: On Wednesday of last week Kellogg was reported to be still in the Custom-house, all the State offices had been turned over to Penn, the courts were taken possession of and reorganized, the McEnery legislature was summoned to meet and impeach the judges who had sustained the Kellogg usurpation, barracks for the White Leaguers were erected as they came pouring in from the country, and "one of the ablest military men in the South," on being asked by a *Tribune* correspondent whether the United States Government would be able to suppress the White Leaguers, supposing them to have "one-half the force they professed to have," and were disposed to resist, replied: "With troops, no; with troops and gun-boats, yes." The city in the hands of the insurgents seems to have been perfectly quiet and orderly, and numerous despatches testifying to this fact were sent to the North, one of them signed by Casey himself. McEnery appeared on the scene from North Louisiana, and this fact, though not of much importance in itself, seemed to be an indication of the intention of the Conservatives to go to work thoroughly in the reorganization of the Government.

On Thursday, however, the Conservatives had come to the conclusion that it would involve a foolish waste of life to attempt any resistance; and a conference was held, followed by a proclamation by McEnery disbanding his militia, and a "circular" was at once issued by General Emory, appointing Brig.-Gen. Brooke military commander of the city, and ordering him to take possession of the State buildings. By this same circular, however, the McEnery police were retained on duty, and made responsible for the good order of the city. The Metropolitan police (Kellogg's) have since been reinstated, and Kellogg is now in full possession. Vigorous efforts are making to effect a compromise between the two parties with regard to the approaching election. The Conservatives demand a fair registration, and they maintain with great plausibility that there is no chance of one if the present officials are retained in power. The State Returning Board is composed of five men, who are all Kellogg partisans, and the Conservatives propose that of these five three shall retire, and two Conservatives, with a Republican approved by Conservatives, shall be appointed to the vacancies. This the Kellog party have declined to agree to; and it remains to be seen what course the negotiations will take. The city now seems to be in good order, and the only quarter from which danger is apprehended appears to be Kellogg's police, a fierce and warlike body, mainly composed of negroes, who are determined, now that they are protected by United States troops, to prevent a war of races at all hazards. The *Tribune* has been making some enquiries among the arms-dealers and manufacturers in this city, and has discovered the singular fact, that notwithstanding the arming of the negroes and whites all over the South, and the active preparations for a bloody war, there are no more arms sold to the South than usual at this time of year. We believe this is almost unexampled in the history of modern warfare.

The Democratic Convention of this State, which met at Syracuse last week, nominated Mr. Samuel J. Tilden for the governorship, and Mr. William Dorsheimer for the lieutenant-governorship. The nomination of Mr. Tilden was in effect a victory of the Respectables over the Roughs, who may be said to constitute the two great divisions of every Democratic convention in this State nowadays. In the old days of Tweed, the Respectables were apt to get the worst of it, but although that statesman is said to have reached forth his arm this year from his retirement on Blackwell's Island to defeat the man who did so much to bring him to his doom, his efforts were unavailing. There was strong opposition to Mr. Tilden from the western part of the State also, owing to the rural jealousy of city managers, but he has been so prominently identified with the reform movement that his opponents were afraid to face the construction which would have been generally put on his rejection. Mr. Tilden is too well known to make it necessary to say anything about him. Should General Dix be put up, as we hope he may, by the Republicans, voters will have in the matter of governors something like an *embarras de richesses*. It is a long time since two men of equal distinction and capacity were offered for their choice. But then General Dix has far the advantage in services, and has given proofs of far higher civil judgment. He was right about the war, about which Mr. Tilden blundered tremendously, and is a much less skilful and astute politician, which in these times is saying a good deal both for him and against Mr. Tilden. Mr. Dorsheimer is a lawyer from Buffalo of considerable literary attainments and high character, who, under the influence of a most unfortunate hallucination, left a district-attorneyship under Grant in order to throw himself into "the Greeley movement." The death of Mr. Greeley removes the only bar we know of to Mr. Dorsheimer's claims on popular confidence. It is a singular, and many would say a hopeful, circumstance that both Democratic candidates are members of the Century Club in this city, something which has never occurred before.

The Democratic platform is a very remarkable document, and shows that light is at last creeping in on the Committee on Resolutions. Entirely absent is the vibratory buncombe which has since the war been so common in these instruments, and by which there is a good word said for each of the two opposing sides of every question on which the party has not committed itself—*e.g.*, while "firmly upholding the just rights of capital, we shall seek by wise legislation to satisfy the reasonable expectations of labor; and, while vigorously maintaining the claims of the railroad corporations to charge what they please, faithfully uphold the right of the producer to have his goods carried for next to nothing." The platform consists, in fact, of a string of short, clear, compact definitions of the position of the party on the leading questions of the day, without the least equivocation. It calls for gold and silver legal-tender, and resumption of specie payments; payment of the public debt in coin; taxation for revenue only; local self-government; equal and exact justice for all men; denounces "the gag-law" and the "sumptuary laws," meaning, we suppose, prohibition; the private use of public funds by public officers; calls for State supervision of corporations; and denounces the third term. The ticket and platform are formally commended to the support of the Liberal Republicans, who are conciliated by the nomination of Mr. Dorsheimer.

Mr. Tilden made a speech in acknowledgment of a serenade after the nomination, in which he drew a picture of the condition of the Republic which would have done credit to the prophet Jeremiah, but which contained many things worth pondering—this, for instance, speaking of the prevailing tendency to centralization:

"We have a country eighteen times as large as France, with a population of 43,000,000, doubling every thirty years, and full of ac-

tivities and interests. A centralized government, meddling with everything and attempting to manage everything, could not know the wants or wishes of the people of the different localities, and would be felt only in its blunders and its wrongs. It would be the most irresponsible, and therefore not only the most oppressive, but the most corrupt, with which any people have been cursed. To-day the advances which we have made toward this system are maturing their fatal fruits. The Federal Administration is tainted with abuses, with jobbery, and with corruption."

His picture of what the Democratic party had to do, however, in order to become worthy of its high mission, is calculated to reduce all but the most sanguine to despair. "It must remove," he says, "every taint which has touched it in evil times. It must become a compact and homogeneous mass. It must gather to its alliance all who think the same things concerning the interests of our Republic." We hope it may; but when one reads the platform of some of the Western conventions, one feels rather blue about the prospect.

When Mayor Havemeyer was arraigned before the Governor by a movement led on by Mr. John Kelly, the leader of Tammany, his mighty heart was filled with thoughts of vengeance, which he has cherished through the long weeks in which he has waited for the Governor's decision, giving, however, frequent hints to the reporters that he was getting a "bombshell" ready which he would explode in due time on Kelly's head, and which would leave nothing visible of that statesman beyond a few shreds of clothing. The severe "wigging" the old gentleman received from General Dix seems only to have rendered his ire deeper, and he has accordingly exploded his shell, which has certainly covered Kelly with earth and stones, from which he promises, however, to extricate himself by degrees. The Mayor's charges are very serious; and, as in the case of the other Ring frauds, of which these, if true, form a part, they come to light through a quarrel with an old confederate, Mr. Nelson J. Waterbury, sometime District-Attorney. It appears, the Mayor says, that when Mr. Kelly was sheriff of the city and county he defrauded the city of $34,259, by charging his legal fee on three or four times as many prisoners as were really convicted; that he defrauded it of $9,945 by charging double the legal fee for the conveyance of prisoners to Blackwell's Island, by charging for prisoners whom he never conveyed, and afterwards, raising his charge still higher, made a further fraudulent gain of $4,586; that he defrauded it of $19,382, by exacting his legal fee for summoning 64,607 jurors more than were required or used, and that he afterwards made further amounts, by raising his fee, and exacting it in like manner when not legally earned; that he cheated the city out of $990 by overcharges for hanging several convicts, exacting in one case $25 for having a person shaved previous to execution. He was, it is alleged, enabled to secure payment of these bills by the connivance of the late comptroller, Connolly. The Mayor is highly pleased with these charges, and has been chuckling over them for several days. Kelly's answer is said to be that the Mayor has omitted the returns from the principal courts, which if true will place the old gentleman in an awkward position.

The Hon. Charles S. Spencer, Col. Joel W. Mason, George Starr, Mr. Disbecker, Justice Flammer, Mr. Van Nort, and Sheridan Shook, have all declared themselves of the opinion within the past week that Governor Dix is certain to be renominated by the Republicans at Utica, and, though the value of the opinion of some of these worthies might under some circumstances be doubted, there can be no question that in this they are right. The renomination of Dix is decided upon, much to the disgust of the Custom-house set, who would, it is thought in some quarters, prefer a ticket headed by Mr. A. B. Cornell, and it is said that they have a plan of putting Mr. Cornell on the ticket as lieutenant-governor, hoping to be able afterwards to send Dix to the Senate in place of Fenton, and thus put Cornell in the governor's chair after all. This story, however, comes from a Liberal-Republican source, and as it concerns gentlemen who understand very thoroughly the value of language as a means of concealing no less than expressing human thoughts, it may be doubted or believed as the reader pleases. For ourselves, we are inclined to hope and to believe it is true, for as it is understood that there are politicians who are not wholly disinclined to consider even now the question of the next Presidential candidate, and as General Dix has been for some time talked about for the office, there may be a connection between the two plans. There is no doubt that the senatorship is quite as important a piece in the game just now as the governorship, and the reported negotiations between Fenton and the Custom-house do not seem as yet to have come to anything. On the other hand, there seems as we go to press more probability of the renomination of all, or a greater part, of the State Ticket, and the confusion and rout of the Custom-house party. The retention of the present Lieutenant-Governor is supposed to be demanded by the "military element," while the "temperance element" is desperately hostile to Dix. These we take to be figures of speech, however.

The five per cent. redemption system introduced by the last Congress seems to have broken down almost as badly as the silver resumption begun by Mr. Richardson. The difficulty seems to be want of time and an excessive number of banks. If there was only one bank in the country, and that was situated within three or four miles of the Treasury Department, the system would work perfectly, for the cashier might easily leave the five per cent. required by the law at the Treasury on his way to business in the morning, and in the afternoon, on returning to his home, might present a few bills to be redeemed. But owing to the reckless manner in which banks have been scattered about the country, one here and another there, and the time required by the common carriers for the delivery of parcels of bills, it now takes a fortnight or more for any one to get a bill to the amount of five dollars redeemed, and, owing to the fact that when redeemed on the five per cent. plan they are after all still only redeemed in paper, no great popular enthusiasm has been developed on the subject. The Treasury has just suspended redemption for a fortnight, but no doubt will begin again as soon as the express companies can be heard from. One peculiarity of the five per cent. plan as distinguished from most economical schemes is, that owing to the small amount of greenbacks retained as a redemption fund, its success can only be secured by everybody's refraining carefully from making use of it.

Tilton has published a second "statement" of enormous length which it is useless to comment on, for the reason we gave last week with regard to Moulton's, namely, the near approach of the legal trial, which, though it may not result in a verdict, will subject the parties to rigid examination and cross-examination. Mr. Beecher has retained Mr. William M. Evarts for his defence, and it is not unlikely Butler will appear on the other side. He has now himself a strong personal interest in the result, as he is, it appears, with his friend B. G. Jayne, the ex-Custom-house detective, part owner of the *Graphic*, the illustrated evening paper to which Moulton and Tilton gave the first publication of their "statements." This paper, as well as Moulton, has been sued for libel by Miss Edna Dean Proctor, about whom Moulton recently produced a most disgusting story.

The trial of the Tilton suit will have the dimensions of a *cause célèbre* of the most tragic kind, as the defendant at least will be fighting, if not for his life, for all that makes life worth having; and as the parties on both sides are exasperated to the last degree, the utmost ferocity will doubtless be displayed. Moreover, it is a church, newspaper, and suffrage fight all in one. Plymouth Church has its existence as an organization at stake; the *Christian Union* too is most deeply interested in it, pecuniarily as well as otherwise; and under the dispute over Mr. Beecher's morality there lies concealed a deadly feud between the New York and Boston women suffragists. Indeed, nearly all the parties in the

controversy are "suffrage workers." In 1870, when the seeds of the *teterrimum bellum* were sown, Beecher was the President of the Boston Suffrage Association, Tilton of the New York one. The Bostonians were proud and scornful, and refused all alliance with the New Yorkers, whom they suspected, and not without cause, of free-love leanings. Tilton tried in vain to bring about a coalition by sending "greetings" to Beecher, and a conference between the two bodies was held in this city in that year, to discuss the question of union, at which, comically enough, Moulton, the Mutual Friend, figured as the alternate of Mrs. Lucretia Mott. All was in vain, however, and they separated breathing mutual defiance, which was aggravated by the increasing prominence of Woodhull in the New York councils. The *Woman's Journal*, in Boston, accordingly stands up valiantly for Mrs. Tilton and Beecher, while the New Yorkers, led by Mrs. Cady Stanton and Susan B. Anthony, though they have since the death of the *Revolution* no organ, are doing yeoman service on the Tilton side by means of letters and "interviews," and will probably appear as witnesses on the trial, and while striking deadly blows at the chastity of the foe fully vindicate their own. The case suggests some curious reflections as to the probable results of a falling out among female politicians during an exciting canvass.

The Irish Protestant Episcopal Church is already, three years after the Disestablishment, face to face with the main difficulty of the voluntary system. Hardly any young ministers are coming forward to take curacies. The rectors have doubled the salaries they offer, but in vain. The divinity students turned out by Trinity College nearly all go to England, where their professional chances and their pay are likely to be much better. The result is terrible wrath against Mr. Gladstone among the senior clergy, who see impending the destruction of the church when, on the death of the present holders of livings, the endowments are withdrawn. The *Spectator* discusses the subject in a very despondent tone, in an article which anticipates the total failure of a supply of educated clergy for an organization which will, under the voluntary system, be able to pay so poorly as the Irish Episcopal Church. It says the resource of an ignorant peasant priesthood, such as the Catholic Church uses in France and Ireland, will not avail, because the Irish Episcopalians who belong to the upper and middle classes will not tolerate an illiterate minister, so that unless bands of men of fortune, willing to do the work for nothing, present themselves, it is difficult to see what is to prevent the extinction of Protestant worship in many parts of Ireland. Indeed, in some places the number of worshippers is so scanty that it must be extinguished under the voluntary system, unless pecuniary help comes from the outside. The *Spectator* suggests the adoption by the church of the Scotch system of licensing no minister who has not had a long university training—that is, four years in the academical department and four years in the divinity school, provided Trinity College will furnish, as it ought, such an education at a cheap rate; but it is difficult to see what should induce any man who cares in the least for money or distinction to pass eight years in a course of preparation for a career which presents so little attraction as the Irish Church apparently does now, no matter how cheaply it was offered him. The difficulty is one which, as everybody knows, is already felt very seriously in the United States. The lack of candidates for the ministry in all the denominations in which any high degree of culture is called for is a growing complaint, which the premiums offered in the shape of cheap education by the theological seminaries do not meet. Men were ready to encounter the privations of a country minister's career when the smallness of the salary was made up for by social and political consideration, and the weight which came from being a member of the only learned class; but they are not willing to face both poverty and lack of influence.

The seeds of trouble between France and Germany have, it is now acknowledged, been sown by the Carlist war, and the French Government is going through a process of discipline to which it has been a stranger since 1819, when the Allies evacuated France. There is no doubt that the Carlists draw their supplies across the French frontier, and as this frontier is on the Spanish side wholly in Carlist hands, and is a wild country, peopled by smugglers, it would require, with the best will in the world, almost superhuman vigilance to stop the traffic, and there is no proof that Marshal MacMahon has not done his duty in the matter. But Germany, which is naturally hostile to the Carlists as the priest-party in Spanish politics, has been still further incensed by the murder of Captain Schmidt, an ex-officer of the Prussian army, who was acting as a newspaper correspondent in the Carlist lines, and was brutally and unjustifiably shot as a spy, and since the recognition of Serrano's Government, Bismarck is evidently disposed to show that he is not prepared to allow the civil war to last indefinitely. A German fleet has accordingly appeared in Spanish waters, and German agents have appeared in the South of France, charged with the duty of watching the Spanish frontier, or, in other words, of seeing whether the French officials do their duty—an impertinence which the French doubtless find it hard to bear, and which they, nevertheless, are in no condition to resent. One would have more sympathy with them if one did not remember that, ten years ago, they were inflicting the same hard, pitiless, and insolent patronage on Italy. In the meantime, the probabilities increase that the growing incapacity of the Madrid Government, combined with the apparent inability or unwillingness of the Carlists to attempt a decisive blow, will before long lead to the joint intervention of the great powers in the interest of humanity, if for no other reason. Both sides, especially the Carlists, are conducting the war with the usual Spanish cruelty, inefficiency in the field being atoned for by ferocity toward the prisoners. The Carlists the other day shot and bayonetted in cold blood eighty poor custom-house officers, who had been drafted into the army, and had been taken after a skirmish, most of them being married men with families. There is an opportunity in the hands of both the United States and Great Britain of teaching the Spaniards a lesson in civilization, in the *Virginius* case now pending, which we trust will not be finally allowed to slip.

The Italian Government is occupied with a problem of hardly less importance than its finances—the pacification of Sicily, in which society seems to be on the eve of dissolution, from causes described in a very interesting article in a recent number of the *Revue des Deux Mondes*, by M. Louis Lande. The island contains no middle or commercial or agricultural class, and is owned in vast estates, and cultivated by laborers or metayers, who are huddled in wretched villages or in the cities, and have to go long distances every day to their work. The church is all-powerful, and the bulk of the population is in a secret league against the law, called *Mafia*, an association made up of brigands and thieves and receivers and their accomplices, who defy the police, overawe jurymen and witnesses, and in fact have brought the machinery of justice, as well as trade and industry, to a stand-still. A conviction in the courts before a jury has become impossible; proprietors cannot visit their farms except under a strong military escort; officials live in daily terror of assassination. The robbers have actually undermined the Government pawnshop, or Mont de Piété, at Palermo, and made vast vaults for the storage of their plunder, and they levy regular taxes in the shape of blackmail on shopkeepers and all peaceable citizens not belonging to the association. The disease is known in the local dialect as *malandrinaggio*, and is the equivalent in an aggravated form of the brigandage of Calabria and Greece. It is, of course, the result of ages of ignorance and bad government and priestcraft, and it cannot be cured in one year or ten. It has been terribly aggravated by an attempt to govern the island on constitutional principles, but it cannot be remedied by a dose of martial law, which is what the Italian ministry now propose to try.

THE LOUISIANA REVOLUTION.

WE have kept our readers informed from time to time of the leading features of the dispute in Louisiana, which finally culminated in the recent outbreak. The history of the State since the war has been very much like that of other Southern States, only sadder. As soon as the constitutional amendments were passed, it was taken possession of by the carpet-baggers and the negroes. The head carpet-bagger was an adventurer named Warmoth, who had served on Banks's staff, had modelled himself on that illustrious soldier, and speedily got himself elected governor. Under his rule and that of his associates, the taxes rose from 37½ cents on the dollar in 1866 to $2 in 1871, and the State debt from $14,500,000 in 1868 to nearly $49,000,000 in 1871. Before the war, a sixty-days session of the legislature cost from $100,000 to $200,000. In 1870, the regular and extra session of the legislature cost $750,000; and in 1871, the regular session alone cost *over* $900,000. In the expenditure of these sums, too, there were, we need hardly say, enormous frauds; and it must be remembered that the legislature which cost these great amounts and imposed these crushing taxes was composed not of civilized men, but of, in large part, ignorant negroes and of white rogues, without character or standing either in the community which they governed or in any other.

All this was bad enough; it was, perhaps, an unavoidable consequence of the sudden admission of a large body of recently emancipated slaves to the franchise, combined with the ill-advised but we think not wholly unnatural or inexcusable abstention of the native whites from participation in local politics at the outset of the Reconstruction process. But everybody will admit that as it was the Federal Government which was subjecting the Southern communities to the perils and sufferings of this tremendous experiment—the like of which has never been seen in the history of the world—the Administration was bound in decency (to take the very lowest view of the matter) to see to it that the Federal officials at the South during this great trial were men who would fairly represent the intelligence, integrity, and public spirit of the conquering North, who would preserve a strict neutrality between the contending local factions, and who would use their influence to prevent excesses, to promote harmony, to repress corruption and to initiate the negroes into the ways of honest and orderly government. The Administration, however, did not take this view of the matter. On the contrary, it took sides with one of the local factions, and sent down officers to represent it who shared fully in all the prevailing vice and turbulence. To New Orleans the President sent as collector of the port—or, in other words, the most powerful local politician—his own brother-in-law, an adventurer of the Warmoth type, named Casey, who was at first in alliance with Warmoth, but afterwards quarrelled with him, and in a fight which they had over the organization of their legislature actually used the United States revenue-cutter to carry off, and keep out of reach of the sergeant-at-arms for ten or twelve days, a sufficient number of members to prevent the Warmoth party getting a quorum. For this, Casey was not removed or even reprimanded, and he was seconded in his operations by a person of like character and antecedents, named Packard, the United States marshal. So far was the President from repenting him of this mode of using the offices in his gift, and so little troubled was he by what was going on in Louisiana, that in March, 1872, he reinforced Casey by appointing one Parker—a carpet-bagger from Lowell, Mass., a brother-in-law of B. F. Butler and uncle of the famous George H. Butler of Alexandria—surveyor of the port.

When there were to be a new governor and legislature elected in 1872, there occurred, as might have been expected, a real South-American scramble for the offices, Casey and the Custom-house siding with the more disreputable of the two factions—that headed by Kellogg, the present governor. The latter, finding that, although he had the Canvassing Board on his side, he had no returns to submit to it, went before the Federal judge, Durell, in a case trumped up under the Enforcement Act, and obtained from this worthy—who has during the past year had impeachment hanging over his head for this offence and for drunkenness—an order, "made," to quote Senator Carpenter's language in the Senate, "out of court, without due form of process, not sealed by the court, and not signed officially, and not directed in the name of the President, as it ought to have been." Upon this process the Judiciary Committee of the Senate expressed itself in these terms:

"Viewed in any light in which your committee can consider them, the order and injunction made and granted by Judge Durell in this case are most reprehensible, erroneous in point of law, and are *wholly void for want of jurisdiction*, and your committee must express their sorrow and humiliation that a judge of the United States should have proceeded in such flagrant disregard of his duty, and have so far outstepped the limits of Federal jurisdiction."

Nevertheless, under this order so granted, the United States marshal went with United States soldiers, seized the State House, and admitted and installed as members of the legislature such persons as Kellogg and Casey chose to designate. When the news of this performance reached Washington, the government thus set up was *promptly recognized by telegraph;* and this is the government under which the State lies to-day, and whose legislation and administration have been in all respects worthy of its origin. The corruption has continued and grown deeper, the contempt for public opinion more open, and the law-making more reckless. The decent people of the State made a strong appeal to Congress and to the Northern public, setting forth the facts. The Senate Committee examined the matter, and the majority found that there was no legal State government in Louisiana; five out of seven members found that, if there was a legal legislature, it was the McEnery legislature. Nevertheless, Congress took no action on the subject. Nor did the Northern public trouble itself about it. A few papers, the *Nation* amongst the number, said what they could of the atrocity and danger of the whole transaction, but it made little or no impression. The great body of the Republican press, in reply to it, crowed and cackled over the "new civil-service rules"; the Republican Convention renominated Grant by acclamation, and he was re-elected. When Casey's term expired, he was reappointed with the utmost brass, and confirmed by the Senate with the utmost coolness. Recalling these things, one does not wonder that two years later "Boss" Shepherd was also renominated.

These things might certainly not unreasonably have reduced the people of Louisiana to despair; but they did not despair. They went on with their business, making the best of the circumstances, and reiterating, through the press, their appeals to the Northern public, and probably hoping to turn the Kellogg government out at the expiration of its term by a lawful vote. That hope, if it existed, has been destroyed by the passage by the Kellogg legislature of a registry law placing the registry of voters throughout the State in the hands of the governor's appointees, whose decision is final, the courts even being prohibited from interference by mandamus or injunction. This law, faithfully carried out, may of course make the present régime perpetual. Upon its enactment, citizens of New Orleans appear to have begun to organize for resistance and to have imported arms from the North. The arms were seized in the gunsmiths' shops by Kellogg's police. This led to an indignation meeting, called by a large body of respectable New Orleans merchants, and the indignation meeting to an armed attack upon the existing government, which at once disappeared.

We must say frankly that we know of no case of armed resistance to an established government in modern times in which the insurgents had more plainly the right on their side. We know of no mark of justifiability in a revolutionary movement, except one, which this Louisiana movement did not possess. The existing government had its origin in fraud and violence; the question of its validity had been passed on by a competent and impartial tribunal, and decided in the negative. The evils it inflicted on the community were, if indefinitely protracted, intolerable; and that they would be indefinitely protracted there was fair reason for believing. Appeals for redress from the outside had elicited neither sympathy nor

response. Had the same state of facts arisen in London, or Paris, or New York, or Boston, there is no candid and impartial person, no lover of order and progress, at the North who would make use of any argument against a resort to force except the improbability of success. Unfortunately for the Louisiana people, they cannot succeed. Their situation is absolutely without precedent. They are not in the clutches of a tyrant who, while he oppresses with a strong hand, preserves order and equality and security. They are the victims of a band of wretched thieves, who could not themselves hold the government for a single hour, who can fulfil no duty of government, but who are kept in their places by overwhelming force from without. We can recall no parallel to the situation except the support given by the Austrians to the petty princes of Italy before 1859; but it is an insult to the Grand-Duke of Tuscany, or Parma and Modena, or even King Bomba, to compare him to Kellogg; and we are bound to say that we do not believe that in seventy years of odious tyranny and interference in Italy, the Austrian troops ever marched on so bad and despicable an errand as that on which the army and navy of the United States were set in motion last week.

We know very well all that can be said and will be said in palliation or defence of the part played by the United States in this miserable affair. We know that the President is not wholly to blame, because Congress might last winter have taken the matter out of his hands; and, under existing circumstances, after his course in recognizing Kellogg in the beginning, there was but one course for him to pursue. We know all that can be said about the bad conduct of the Southerners in the old slavery days. But we know also that, if it is deliberately determined to divide the States into two classes, leaving one in quasi-dependence on the arbitrary will of the executive, and liable to processes which would not be tolerated in the other class, the belief that free government will last very long on this continent is a chimera. In striking down the people of Louisiana for what they did last week, we help to extirpate the feelings and opinions and powers which have made this nation what it is, and which raise it above Mexico, and which give it all its promise for the future. No conduct on the part of any people, however bad, can forfeit their right to good government. That is the one really "inalienable right." No man or body of men on earth, however high or mighty or respectable, is entitled to inflict bad government on any community or any worse government than circumstances will permit. No acts of the South, and especially no acts committed before the war, can discharge the victor in the late rebellion from the duty of promoting the peace and prosperity of that portion of the Union by every means in its power. The doctrine that we can wash our hands of its troubles because the Charleston mob behaved badly to Mr. Hoar, or because the lives and property of Northern men were not then safe in many Southern districts or are not safe now, is a doctrine which no civilized man can hold or preach. The worse the state of morals or manners down there, the more careful and conscientious we should be in our treatment of the case. Our business is to govern the South as it is—that is, as negro slavery and civil war have left it, and not the South as it would be if there never had been any slavery in it or any rebellion; and as if the Pilgrim Fathers had landed on Sullivan's Island instead of Plymouth Rock.

The question, What should the North do? was asked last winter in Congress, and a committee was appointed to try and find out, but was discharged without any action on its report. This was a result which might naturally have been expected from a body which for some years back has never seen its way to any course on any subject whatever, except under powerful pressure from public opinion. On this matter of the condition of the South, there has however been no pressure from public opinion. People at the North, exasperated by the war, by the recalcitrancy of the whites in the matter of Reconstruction, and by the Ku-klux outrages, have not been in the mood to approach the Southern problem even from the selfish side, and consider seriously the probable effects on our polity of the protracted subjection of nearly half the Union to a régime not greatly superior to that of the Niam-Niam monarchy Moreover, the love of transcendental politics, the indisposition to treat the work of government as essentially experimental, and the inclination to put universal suffrage side by side with the Gospel and treat it as a specific for all social and political diseases, have been too deep-seated to permit of any open-minded consideration of the difficulty. We do not propose to go very far into the subject to-day. We shall confine ourselves to mentioning one thing that Northern voters can insist on, which violates no political tradition, which involves no concessions or pledges, no expense or trouble, and which religion and humanity and the general safety imperatively call for, and which a roused and indignant public opinion can bring about, viz., the absolute and immediate withdrawal of Federal countenance and support from the knaves who now have the upper hand in Southern politics, and the filling of Federal offices at the South with a new and better class of men, who will serve as missionaries rather than panders and conspirators. The success of the thieves in South Carolina and Louisiana as well as elsewhere, and their hold on the ignorant masses whom we have enfranchised, are mainly due to the fact that our marshals, and collectors, and surveyors, and postmasters are their confederates, and keep them assured of the support of the authorities at Washington in case the worst comes to the worst. This ought to come to an end; but it will not come to an end unless the public takes the matter in hand. There is enough stolid and selfish insensibility at the White House, and enough lazy indifference in Congress, to stand a dozen such broils as this in Louisiana with perfect equanimity. The President is probably glad he has not had to kill people or bombard an American city in order to reinstate Kellogg, but he is probably not sorry that he put him in power in the beginning, and does not care how long he stays in it.

THE RIGHT TO CONFISCATE.

THE Chief-Justice of the Supreme Court of Wisconsin has published an abstract of the recent railroad decision of his court which makes the grounds of it perfectly intelligible. The argument, which is very simple and logical, is this: The Constitution of the United States contains a clause forbidding the States from passing laws "impairing the obligation of contracts," and ever since the decision of the Supreme Court in the Dartmouth College case it has been considered settled law in this country that the charter of a college or railroad or any other similar corporation is a "contract" within the meaning of this clause. It follows from this, as equally well-settled law, that a State legislature, having once made a contract with a corporation by giving it a charter, must afterwards leave the contract or charter alone. There is, however, one exception—where the State itself has reserved the right to alter or repeal the charter. In that case, the contract has been made subject to the right of one of the parties to alter or cancel it. This is the case in Wisconsin. In the State constitution, for the purpose of taking the railroads in that State out of the rule established by the Supreme Court in the Dartmouth College case, a clause was inserted giving the legislature the power to "alter or repeal" corporate charters, and the Potter law, as it is called, was passed under the power supposed to be granted by this clause. The law is no doubt an alteration of the charter, for it takes away from the roads affected by it all control over their tariffs, and vests in the State itself the right to determine the amount of the transportation charges. The railroads have opposed the law principally upon the ground that the new rates make it impossible for them to carry on their business at a profit. This is disputed by the supporters of the law; but it will easily be perceived that whether or not it be a fact is a matter of complete indifference from our present point of view. The Constitution gives the right to "alter" the charters in any way; the power is absolute and uncontrolled; and the people who invested money in the roads, either by stock subscriptions or purchase of bonds, did so, or ought to have done so—and if they did not it was no fault of the State's—with a full knowledge that the

State had a complete power to make their property worthless at any time.

This is the argument of those who support the law, and we may notice here one practical consequence from it which seems to have escaped the attention of the railroad people themselves. They are reported to have declared, since the decision was announced, that they intend to conform to the law, but to have added that they should be unable any longer to furnish the public with the same sort of transportation that they have furnished heretofore. If they are only to be allowed to charge Potter rates, they must give the public Potter cars, Potter rails, and Potter time. They will be obliged to take off some of their best cars, use more of their worst cars, make slower speed, and spend less in keeping the road-bed in good condition. But if the argument we are now considering be sound, the Milwaukee and Northwestern roads had better be very careful how they make these changes. The people are watching them, and the people know that the power to alter a charter does not give merely the power to fix rates: it gives power to do anything; and under it the roads can be made not only to lower their rates, but to improve their cars, speed, and roadway at the same time. All that would have to be done would be to pass a new law to that effect next winter, and the roads would have to conform to it just as they now have to conform to the Potter law as to the rates. The argument adopted by the supporters of the law is conclusive upon this point. The very perfection and logical coherence of it make it all the more impossible to escape from this conclusion. Last winter, the Grangers came to the conclusion that what they wanted was reduction of the rates; next winter, their fancy may take another turn, and they may think that each passenger ought to have a car for himself, with meals along the route furnished gratis by the company. On the principle maintained by the supporters of the Potter law, the legislature has a perfect right to force the roads to do this.

The whole matter will very shortly come before the Supreme Court of the United States, and it is, as we believe, of the last importance that it should be there determined not only correctly, but in such a way as to inspire public confidence in the decision. The Court, for the first time almost in its history, is out of politics. The judges are not Democrats or Republicans, nor are they politically divided as the country once was on the question of internal improvements. Since the lamentable fiasco of the legal-tender decision, the Court has shown a marked tendency to conservatism and self-respect. In construing the new amendments to the Constitution, it has shown a very laudable determination to cling to old and well-settled maxims of interpretation. The country will look with deep interest to its decision in this case; and, in view of the approaching argument, it may be worth while to point to one or two considerations which are of great importance, and do not yet seem to have attracted much attention.

In the first place, the Supreme Court of Wisconsin and the supporters of the Granger legislation generally indulge in a good deal of loose talk about a distinction of some kind between the corporate property of the railroad other than the franchise, and the franchise. In Chief-Justice Ryan's abstract, after saying that the State is under a "moral obligation" not to reduce tolls beyond a fair and reasonable amount (though where this moral obligation comes from, when the State has given notice to all the world that it has reserved the right to do anything it pleases with the tolls, we do not know), he says their "power over the franchise is absolute. But the power to alter or repeal cannot affect the property of corporations other than the franchise. Such right of property is inviolable." The Supreme Court of Wisconsin has always had a very respectable reputation, and we have therefore endeavored with humility and patience to make out what this means. We confess ourselves unable to do so. Most railroads are built nowadays "on bonds," *i.e.*, with borrowed money. It is maintained among some of the Western moralists who have considered the subject that this is a wicked way to build railroads; but no other way has been suggested by them as a substitute. When a road is built on bonds, one thing is pretty evident, that anything which affects the right to collect tolls affects the value of the bonds; and it is a notorious fact that the securities of the Granger railroads, as they are called, have been unfavorably affected by the recent legislation. But though the franchise—that is, the right to take tolls—may be taken away altogether or altered in any way that seems best to the legislature of Wisconsin, and in this way the bonded debt be practically wiped out, there is still, according to this Court, some right of property which is "inviolable." What is it? We sincerely trust that at Washington this matter will not be left undetermined. The franchise is not inviolable, because it may be repealed to-morrow; the bonds are not inviolable, because anything that touches the franchise touches them, so that we are left very much in the dark as to what these inviolable rights are. It might be well for the Supreme Court at Washington to consider the case in this light: If a State reserves a right to repeal or alter a charter, have bondholders in such a State any rights at all, and if so, what are they? As we understand this decision, they have no rights which the State is bound to respect or which the United States is bound to enforce; and we take this opportunity of saying, that until this decision is reversed, anybody who puts his money into Wisconsin railroad bonds does so at his peril. The right of confiscation is what this decision is based upon—a right which, like that of altering or amending railroad charters, is an "attribute of sovereignty." Lawyers and judges are justly averse, in the consideration of legal questions, to look too closely at practical consequences, for the excellent reason that, whatever conclusion is reached, some bad practical consequences are certain to follow, and that the only sure guide is legal principles. This rule, however, does not apply to legal consequences, and it is legal consequences we are here considering. What we say is this—the right to alter or annul a charter gives, according to the Wisconsin Supreme Court, the right to fix rates; but the right to fix rates involves the right to impair or destroy the value of property which depends for its very existence on the rates—*i.e.*, mortgage bonds. Therefore we have quite as much right to begin at the other end, and enquire not what the State may do with the franchise, but what the bondholders can do without the franchise. According to Chief-Justice Ryan, they, or some one, has certain "inviolable rights." What are they?

Again, no lawyer will contend that the State of Wisconsin can have any more power over chartered or other kinds of contracts, through reserving a right to "alter or repeal," than it would have were there no provision in the United States Constitution on the subject. Wipe out the whole United States Constitution, and make the legislature of Wisconsin sovereign in fact as well as name, and the naked question would then appear, whether a State legislature can confiscate railroad property by fixing rates. The Wisconsin constitution, as well as the constitutions of most other States, contains what is commonly known as a bill of rights, and one of the clauses in this bill (which is not an invention or device of constitution-makers, but one of the dearly-bought immunities which were wrung long ago from the tyranny of government) forbids the taking of private property for public use without compensation. We cannot here go into an examination of the numerous cases which have been decided in this country as to what constitutes a "taking" within the meaning of this clause; but the Supreme Court at Washington has not very long ago laid it down (in the case of Pumpelly *v.* Green Bay, 13 Wallace, 166) that the property need not be absolutely *taken* in the narrow sense of the word, but any serious interruption to the common and necessary use of it will be considered equivalent to a taking. Now, if any one can discover any more effectual way of seriously interrupting the common and necessary use of a railroad franchise than by altering the rates of transportation, we should like to know what it is. The value of the property consists entirely in the right to take tolls, and yet the State, after giving this right and allowing money to be borrowed on the faith of it, and on the faith of it alone, maintains that it can do what it pleases on the subject.

Again, what is the right of taking tolls? According to the supporters of the Granger legislation, it is nothing more nor less than a

kind of taxation. The railroads are, for certain public purposes, authorized to collect and appropriate from the farmers a certain charge, which is collected by a specific assessment on the property transported. Supposing this to be a true view of the matter, it must not be forgotten that something more has been done. The road has mortgaged this grant to the bondholders, and if the farming out of the tax is interfered with, it is the bondholders who suffer. If, now, the State, under its sovereign right to collect taxes, can fix the amount of this charge at any figure it pleases, and let the money, which would otherwise go to the bondholders, go to the farmers, what is this but taxing A for the benefit of B? There is nothing more sovereign than the power of taxation, yet there is nothing so well settled as that a State cannot, under it, take A's property and give it to B. There are no constitutional provisions on the subject in any of the States, so far as we are aware, because it has never been considered necessary until recently to provide in constitutions against the actual practice of highway robbery by the chosen representatives of the people.

And this brings us to the consideration of the point on which rests the whole case. No lawyer will deny that when the legislature reserves a right to alter or amend a charter, the State has some reserved rights. But it is not necessary for us, and it is not at all necessary for the Supreme Court, to enumerate or codify these rights. The opponents of this Western legislation maintain that whatever the reserved rights may be, the right to pass laws completely taking away the main corporate franchise, without compensation, is not among them. The power over charters, like the power over taxation or the police power, must be exercised in a rational way. The right to "alter or amend" this kind of contract must be looked at not only in the light of the literal meaning of the words, but in the light of all the circumstances of the case—including the fact that the State has allowed important rights to be created under the charter which by every principle of public law are inviolable. The whole argument in favor of the Potter law is a logic-chopping argument. The conclusion flows from the premises as naturally and necessarily as if it were all in *darii* or *babara*. If law were formal logic, it would be perfect. But the way to decide the case is not this; we must take the whole constitution of Wisconsin, and the whole Constitution of the United States, and then ask ourselves what is this Potter law—whether it is or is not confiscation? If it is, is confiscation legal? If it is illegal, then the Supreme Court of the United States will say to the State of Wisconsin: "Your law is illegal; we have wiped it from your statute-book. You have a right to alter or amend charters, but they must be altered in a reasonable and moral way. You cannot use this right as a cover for robbery, and your so-called law is void."

CHROMO-CIVILIZATION.

THE last "statement," it is reasonable to hope, has been made in the Beecher-Tilton case previous to the trial at law, and it is safe to say that it has left the public mind in as unsettled a state as ever. People do not know what to believe, but they do not want to hear any more newspaper discussion by the principal actors. We are not going to attempt any analysis or summing-up of the case at present. It will be time enough to do that after the *dramatis personæ* have undergone an examination in court, but we would again warn our readers against looking for any decisive result from the legal trial. The expectations on this point which some of the newspapers and a good many lawyers are encouraging are in the highest degree extravagant. The truth is that only a very small portion of the stuff contained in the various "statements" can, under the rules of evidence, be laid before the jury—not, we venture to assert, more than would fill half a newspaper column in all. What *will* be laid before the jury is, in the main, "questions of veracity" between three or four persons whose credit is already greatly shaken, or, in other words, the very kind of questions on which juries are most likely to disagree, even when the jurymen are entirely unprejudiced. In the present case they are sure to be prejudiced, and are sure to be governed, consciously or unconsciously, in reaching their conclusions, by agencies wholly foreign to the matter in hand, and are thus very likely to disagree. There are very few men whose opinions about Mr. Beecher's guilt or innocence are not influenced by their own religious and political beliefs, or by their social antecedents or surroundings. A curious and somewhat instructive illustration of the way in which a man's fate in such cases as this may be affected by considerations having no sort of relation to the facts, is afforded by the attitude of the Western press towards the chief actors in the present Scandal. It may be said, roughly, that while the press east of the Alleghanies has inclined in Beecher's favor, the newspapers west of them have gone somewhat savagely and persistently against him, and have treated Tilton as a martyr. The cause of such a divergence of views, considering that both Tilton and Beecher are Eastern men, is of course somewhat obscure, but we have no doubt that it is due to a vague feeling prevalent in the West that Tilton's cause is the democratic one—that is, the cause of the poor, friendless man against the rich and successful one—a feeling somewhat like that which in England enlisted the working-classes in London on the side of the Tichborne Claimant, in defiance of all reason and evidence, as a poor devil fighting a hard battle with the high and mighty. One of the reporters of a Western paper which has made important contributions to the literature of the Scandal, recently accounted for his support of Tilton by declaring that in standing by him he was "fighting the battle of the Bohemians against Capital." Another Western paper, in analyzing the causes of the position taken by the leading New York papers on Beecher's side, ascribed it to the social relations of the editors with him—believing that they met him frequently at dinners and breakfasts, and found him a jovial companion. All this would be laughable enough if it did not show the amount of covert peril—peril against which no precautions can be taken—to which every prominent man's character is exposed. The moment he gets into a scrape of any kind he finds a host of persons, whose enmity he never suspected, clamoring to have him thrown to the beasts "on general grounds"—that is, in virtue of certain tests adopted by themselves, judged by which, apart from the facts of any particular accusation, a man of his kind is unquestionably a bad fellow. The accusation, in short, furnishes the occasion for destroying him, not necessarily the reason for it.

In Europe there are already abundant signs that the Scandal will be considered a symptomatic phenomenon—that is, a phenomenon illustrative of the moral condition of American society generally; for it must not be overlooked that, putting aside altogether the question of Beecher's guilt or innocence, the "statements" furnish sociological revelations of a most singular and instructive kind. The witnesses, in telling their story, although their minds are wholly occupied with the proof or disproof of certain propositions, describe ways of living, standards of right and wrong, traits of manners, codes of propriety, religious and social ideas, which, taken together, form social pictures of great interest and value. Now, if these were really pictures of American society in general, as some European observers are disposed to conclude, we do not hesitate to say that the prospects of the Anglo-Saxon race on this continent would be somewhat gloomy. But we believe we only express the sentiment of all parts of the country when we say that the state of things in Brooklyn revealed by the charges and countercharges has filled the best part of the American people with nearly as much amazement as if an unknown tribe worshipping strange gods had been suddenly discovered on Brooklyn Heights. In fact, the Actors in the Scandal have the air of persons who are living, not *more majorum*, by rules with which they are familiar, but like half-civilized people who have got hold of a code which they do not understand, and the phrases of which they use without being able to adapt their conduct to it.

We have not space at our command to illustrate this as fully as we could wish, even if the patience of our readers would permit of it, but we can perhaps illustrate sufficiently within a very short compass. We have already spoken of the Oriental extravagance of the language used in the Scandal, which might pass in Persia or Central Arabia, where wild hyperbole is permitted by the genius of the language, and where people are accustomed to it in conversation, understand it perfectly, and make unconscious allowance for it. Displayed here in the United States, in a mercantile community, and in a tongue characterized by directness and simplicity, it makes the Actors almost entirely incomprehensible to people outside their own set, as is shown by the attempts made to explain and understand the letters in the case. Most of the critics, both the friendly and hostile, are compelled to treat them as written in a sort of dialect, which has to be read with the aid of commentaries, glosses, and parallels, and accompanied, like the study of Homer or the Rig-Veda, by a careful examination of the surroundings of the writers, the conditions of their birth and education, the usages of the circle in which they live, and the social and religious influences by which they have been moulded, and so on. Their almost entire want of any sense of necessary connection between facts and written statements has been curiously revealed by Moulton's

production of various drafts or outlines of cards, reports, and letters which they proposed from time to time to get up and publish, for the purpose of settling their troubles and warding off exposure, by imposing on the public. No savages could have acted with a more simple-minded, not disregard, but unconsciousness of truth. Moulton, according to his own story, helped Beecher to publish a lying card; got Tilton to procure from his wife a lying letter; and Tilton concocted a lying report for the Committee, in which he made them express the highest admiration for himself, his adulterous wife, and her paramour. Here we have a bit of the machinery of high civilization—a committee, with its investigation and report, used, or attempted to be used, with just the kind of savage directness with which a Bongo would use it, when once he came to understand it, and found he could make it serve some end, and with just as little reference to the moral aspect of the transaction.

Take, again, Tilton's account of the motives which governed him in his treatment of his wife and of Beecher. He is evidently aware that there are two codes regulating a man's conduct under such circumstances—one the Christian code, and the other the conventional code of honor, or, as he calls it, "club-house morality"; but it soon became clear that he had no distinct conception of their difference. Having been brought up under the Christian code, and taught, doubtless, to regard the term "gentleman" as a name for a heartless epicurean, he started off by forgiving both Beecher and his wife, or, as the lawyers say, condoning their offence; and he speaks scornfully of the religious ignorance of the Committee in assuming in their report that there was any offence for which a Christian was not bound to accept an apology as a sufficient atonement. The club-house code would, however, have prescribed the infliction of vengeance on Beecher by exposing him. Accordingly, Tilton mixes the two codes up in the most absurd way. Having, as a Christian, forgiven Beecher, he began, thirty days after the discovery of the offence, to expose him as a "gentleman," and kept forgiving and exposing him continuously through the whole four years, the *éclat* of such a relation to Beecher having evidently an irresistible temptation for him. Finally, when Dr. Bacon called him a "dog," he threw aside the Christian rôle altogether, and began assailing his enemy with truly heathen virulence and vigor. A more curious blending of two conceptions of duty is not often seen, and it was doubtless due to the fact that no system of training or culture had made any impression on the man, or gone more than skin-deep. His interview with Beecher, too, by appointment, at his own house, for the purpose of ascertaining by a comparison of dates and reference to his wife's diary the probable paternity of her youngest child, which he describes with the utmost simplicity, is, we venture to say, an incident absolutely without precedent, and one which may safely be pronounced foreign to our civilization. Whether it really occurred, or Tilton invented it, it makes him a problem in social philosophy of considerable interest.

Moulton's story, too, furnishes several puzzles of the same kind. That an English-speaking Protestant married couple in easy circumstances, and of fair education, and belonging to a religious circle, should not only be aware that their pastor was a libertine and should be keeping it a secret for him, but should make his adulteries the subject of conversation with him in the family circle, is hardly capable of explanation by reference to any known and acknowledged tendency of our society. But perhaps the most striking thing in Moulton's rôle is that while he appears on the scene as a gentleman or "man of the world," who does for honor's sake what the other Actors do from fear of God, his whole course is a kind of revolting caricature of what a gentleman under like circumstances would really do. For instance, he accepts Beecher's confidence, which may have been unavoidable, and betrays it by telling various people, from time to time, of the several incidents of Beecher's trouble, which is what a weak or loose-tongued person—vain of the task in which he was engaged, as it seemed to him, *i.e.*, of keeping the peace between two great men—might readily be guilty of; but he tells the public about it in perfect unconsciousness that there was anything discreditable in it, as he does of his participation in the writing of lying letters and cards, and his passing money over from the adulterer to pacify the injured husband. In fact, he carries, according to his own account, his services to Beecher to a point at which it is very difficult to distinguish them from those of a pander, maintaining at the same time relations of the most disgusting confidence with Mrs. Tilton. Finally, too, when greatly perplexed as to his course, he goes publicly and with *éclat* for advice to a lawyer with whom no gentleman, in the proper sense of the term, could maintain intimate personal relations or safely consult on a question of honor. The moral insensibility shown in his visit to General Butler is one of the strange parts of the affair.

We have of course only indicated in the briefest way some of the things which may be regarded as symptomatic of strange mental and moral conditions in the circle in which the affair has occurred. The explanation of them in any way that would generally be considered satisfactory would be a difficult task. The influences which bring about a certain state of manners at any given time or place are always numerous and generally obscure, but we think something of this sort may be safely offered in consideration of the late "goings on" in Brooklyn: In the first place, the newspapers and other cheap periodicals, and the lyceum lectures and small colleges, have diffused through the community a kind of smattering of all sorts of knowledge, a taste for reading and for "art"—that is, a desire to see and own pictures—which, taken together, pass with a large body of slenderly-equipped persons as "culture," and give them an unprecedented self-confidence in dealing with all the problems of life, and raise them in their own minds to a plane on which they see nothing higher, greater, or better than themselves. Now, culture, in the only correct and safe sense of the term, is the result of a process of discipline, both mental and moral. It is not a thing that can be picked up, or that can be got by doing what one pleases. It cannot be acquired by desultory reading, for instance, or travelling in Europe. It comes of the protracted exercise of the faculties for given ends, under restraints of some kind, whether imposed by one's self or other people. In fact, it might not improperly be called the art of doing easily what you don't like to do. It is the breaking in of the powers to the service of the will; and a man who has got it is not simply a person who knows a good deal, for he may know very little, but a man who has obtained an accurate estimate of his own capacity, and of that of his fellows and predecessors, who is aware of the nature and extent of his relations to the world about him, and who is at the same time capable of using his powers to the best advantage. In short, the man of culture is the man who has formed his ideals through labor and self-denial. To be real, therefore, culture ought to affect a man's whole character, and not merely store his memory with facts. Let us add, too, that it may be got in various ways, through home influence as well as through schools or colleges; through living in a highly organized society, making imperious demands on one's time and faculties, as well as through the restraints of a severe course of study. A good deal of it was obtained from the old Calvinistic theology, against which, in the days of its predominance, the most bumptious youth hit his head at an early period of his career, and was reduced to thoughtfulness and self-examination, and forced to walk in ways that were not always to his liking.

If all this be true, the mischievous effects of the pseudo-culture of which we have spoken above may be readily estimated. A society of ignoramuses who know they are ignoramuses, might lead a tolerably happy and useful existence, but a society of ignoramuses each of whom thinks he is a Solon, would be an approach to Bedlam let loose, and something analogous to this may really be seen to-day in some parts of this country. A large body of persons has arisen, under the influence of the common-schools, magazines, newspapers, and the rapid acquisition of wealth, who are not only engaged in enjoying themselves after their fashion, but who firmly believe that they have reached, in the matter of social, mental, and moral culture, all that is attainable or desirable by anybody, and who therefore tackle all the problems of the day—men's, women's, and children's rights and duties, marriage, education, suffrage, life, death, and immortality—with supreme indifference to what anybody else thinks or has ever thought, and have their own trumpery prophets, prophetesses, heroes and heroines, poets, orators, scholars, and philosophers, whom they worship with a kind of barbaric fervor. The result is a kind of mental and moral chaos, in which many of the fundamental rules of living, which have been worked out painfully by thousands of years of bitter human experience, seem in imminent risk of disappearing totally.

Now, if we said that a specimen of this society had been unearthed in Brooklyn by the recent exposures, we should doubtless, to many people, seem to say a very hard thing, and yet this, with the allowances and reservations which have of course to be made for all attempts to describe anything so vague, shifty, and fleeting as a social state, is what we do mean to say. That Mr. Beecher's preaching, falling on such a mass of disorder, should not have had a more purifying and organizing effect, is due, we think, to the absence from it of anything in the smallest degree disciplinary, either in the shape of systematic theology, with its tests and standards, or of a social code, with its pains and penalties. What he has most encouraged, if we may judge by some of the fruits, is vague aspiration and lachrymose sensibility. The ability to dare and do, the readiness to ask one's due which comes of readiness to render their due to others, the profound consciousness of the need of sound habits to brace and fortify morals, which are the only true foundation and support of a healthy civilization, are things which he either has not preached, or which his preaching has only stifled.

Notes.

A NEW English weekly journal of public health, called the *Sanitary Record*, issued its first number July 4, making a good beginning with well-known writers. It is a handsomely printed quarto. G. P. Putnam's Sons have the American agency.——According to the *Academy*, Professor Corssen's work on the 'Language of the Etruscans' appears this month.——Mr. Wm. H. Whitmore, 56 Studio Building, Tremont Street, Boston, solicits subscriptions to a new edition of the genealogy of the Eliot Family. The one previously published in 1854 dealt only with the descendants of the Rev. John Eliot (the "apostle to the Indians"), of Roxbury, Mass. In the meantime, much has been learned concerning his birth and ancestry, and the descendants of his brothers, who likewise settled in this country, and concerning other families of the name. Corrections and additions to the previous record are desired by Mr. Whitmore. The volume, when completed, will make about 200 pages 8vo, and will be published by Joel Munsell, Albany, at $4 to subscribers, as soon as one hundred names are secured.——We have received from B. Westermann & Co. Part 7 of the first and Part 5 of the second volume of Ritter's German Gazetteer (Holzbalge—Ronda).——The Prison Association of New York will gladly receive at their rooms, No. 19 Centre Street, contributions of books, magazines, etc., for the newly-provided library for the penitentiary on Staten Island. Money for the purchase of books for the same destination may be sent to Wm. C. Gilman, Treasurer, 46 Pine Street.——The hay-fever refugees among the White Mountains have formed a permanent association for the discovery and spread of whatever promises to relieve or cure the malady. For the ensuing year, Judge Briscoe, of Hartford, was chosen president, and Mr. Frank B. Fay, secretary. The latter is also very appropriately secretary of the Massachusetts Society for the Prevention of Cruelty to Animals, and his new duties will be to communicate any glad tidings of relief to all the members of the association. The annual place of meeting is Bethlehem, N. H., on the last Monday in August.

—We had the pleasure not long since of describing with the praise which was due them two such different and individual catalogues as those of the State Library at Madison, Wisconsin, and the Mercantile Library of St. Louis. Another catalogue is now before us, which also has its peculiar merits, and is in some respects superior to those just mentioned. We refer to the catalogue of the Mercantile Library of San Francisco, the third which the Association has issued in twenty years. In 1854, the library contained less than 3,000 volumes; in 1861, nearly 14,000; the present catalogue enumerates more than 36,000. Its general plan is that of the Boston Public Library catalogues, but the extent to which this has been carried out makes it an improvement upon its model. Thus, the titles are very full, and the topical classification very comprehensive—more so than would be practicable in a collection numbering 100,000 volumes; while the alphabetical arrangement is carried even into tables of contents. Examples of subject-divisions are Drawing, Indians, Insanity, Manners and Customs, Men, Philosophy, Photography, Physical Geography, Railroads, Rare Books, Sermons, Sociology, Voyages, etc. The Franco-Prussian War is another division; others still, Mineralogy, and Mines and Mining, on which stress is naturally laid in a catalogue for the Pacific Coast. Biography occupies three pages. States and countries, and even cities, obtain a systematic as well as alphabetical classification. The works relating to California fall under six heads, and cover ten pages; those on San Francisco cover two and a half. Wherever the case permits (*e.g.*, New England, Scotland, etc.), Historical Fiction forms the last group of illustrative works. All this is admirably done, with an eye to the needs of the general reader; but equally time and labor-saving is the alphabetizing of collections and of contents of works which would otherwise have to be handled and examined. For instance, all the Dramas in the Library are arranged by title from A to Z, and occupy nearly twenty-four pages, closely printed, in three columns; Lacy's plays occupy three and a half pages; all the Arundel Society's and all the Chaucer Society's publications are alphabetically arranged; and the same labor has been performed after classification for the Smithsonian Institution's Reports, Contributions, and Collections, occupying some five pages. On the one hand, the contents of a simple book of essays (like that made up from articles in the *Nation*) are printed in the order of the dictionary; on the other, Sainte-Beuve's essays, or Villemain's or Voltaire's or Goethe's or Swift's or Bentham's collected works, or Griswold's 'Prose Writers of America,' is made easy of reference before a single volume has left the shelf. The Shakspere analysis and grouping are further evidences of the compiler's intelligence and industry; and indeed there is no end to the examples which we might give of this feature of the catalogue, the utility of which has doubtless occurred to other librarians besides Mr. Whitaker, but has never, so far as we are aware, been undertaken on such a scale as in the San Francisco catalogue. The work deserves, in fact, as we believe we remarked of its Western predecessors, to be kept in all libraries as a guide to readers and students—as a part of the economy of such institutions.

—Mrs. Martha Walker Cook, who died on Tuesday week, aged 67, was a good Greek and Latin scholar, a fluent speaker and writer of the French, German, and Italian languages, was familiar with the Spanish and Portuguese literatures, and, through Continental translators, with Polish, Servian, and Russian poetry. Her knowledge of theology, metaphysics, and of music was that of a hard student. She was noted for active charities, effectual sympathy with Polish and other national woes, and also as the head of an intellectual and elegant *salon*. She had translated—but through the medium of German and French versions—Krazinski's "Ungottliche Komödie," the Polish masterpiece, first into English prose and afterwards into rhythm. During the rebellion, Mrs. Cook relieved her brother, the Hon. Robert J. Walker, of the editorship of the *Continental Monthly* magazine. We regret to have to chronicle also the death of Mr. David Lee Child, which took place at Wayland, Mass., on Friday last. He was, we believe, originally a lawyer by profession; and at one time also an instructor in the Boston Public Latin School. He was a vigorous and able writer for the press, and together with his wife, Mrs. Lydia Maria Child (better known than himself, but not because of any intellectual inferiority on his part), edited at one time the *National Anti-Slavery Standard* in this city. He died at the age of eighty.

—The death of Judge B. R. Curtis is a loss not only to the bar of New England, but to the entire country. The quiet and strictly professional life he led from the time of his retirement from the Supreme Court in 1857 down to his death, prevented his great abilities and learning from being as thoroughly recognized outside New England as they were in it. Indeed, if it had not been for his appearance in the impeachment trial of Johnson, it may be doubted whether the general public would not have required at his death to be assured that this Judge Curtis was really and in fact the same Judge Curtis who, some twenty years ago, took part, with much credit to himself, in one of the greatest political cases which have ever been decided by the Supreme Court. The interval between these two public appearances was filled by an active professional life, in which he was always engaged in the most important suits or in the consideration of important questions submitted to him for reference. He has left behind him little, we believe, except his decisions while on the bench of the Supreme Court, some volumes of Reports, and arguments scattered through other volumes not his. He was a lawyer *pur sang*, accomplished and profound, though without the eloquence which is necessary to make a popular advocate. Lucidity was the distinguishing characteristic of his reasoning and delivery, and his use of language was always so pure and pointed, and his manner so little that of an advocate, that in hearing him argue a case it was sometimes difficult for the hearer to believe that he was not listening rather to the decision. For one thing, his loss is almost a public calamity—that he was one of the few remaining lawyers of age and experience in America who combined with devotion to the study and science of the law, in no narrow or technical sense, a complete indifference to public clamor of any kind, and who could be neither turned aside by fear of public disapproval nor carried away on a tide of popular enthusiasm. The country is willing enough now to see that in the Dred Scott case and the Johnson impeachment he did the United States great public service; hereafter, too, we have very little doubt that his opinion, recently given in the Wisconsin Railroad matter, will be cited as a proof of his sagacity and his comprehensive grasp of the fundamental principles of public law.

—Dr. Dyrenfurth, the newly-appointed principal examiner in the class of Chemistry, in the Patent Office, has recently rejected an application for letters-patent for a "medical compound," substantially upon the grounds that a mere mechanical mixture, or assemblage without chemical union, of a number of medical ingredients, possessing well-known properties, is neither such invention nor discovery of a new and useful composition of matter as is contemplated by the law—its preparation involving at most only the exercise of a skill common, in varying degree, to all persons having a knowledge of disease and of the curative properties of drugs and medicines; that, if patents may issue upon this and kindred applications, it follows, such skill being exercised whenever a physician writes an original prescription, that thousands of patentable inventions of this class are made daily—a fatal *reductio ad absurdum*—and that the creation of monopolies restraining others from the exercise of such skill is in contravention of public policy and human welfare. It might have been further urged that, in the present stage of therapeutic knowledge, there is no mode of determining with reasonable certainty whether a given medical agent (with rare exceptions) does really

produce the result claimed or exercise the function ascribed, matters usually susceptible of demonstration in other classes of patents. The omission, however, loses importance in view of the grave doubt that the decision of the examiner will be ultimately sustained. Probably the only remedy for the reproach of Governmental aid in the patent-medicine business must be sought through a change in the law—a change which, by excluding medicines from the category of patentable matters, will bring the United States patent laws in harmony with those of the large majority of other countries.

—Circular No. 90 of the Treasury Department, and General Order No. 109 of the War Department, calling attention to an almost forgotten statute (February 25, 1799) concerning quarantine and the public health, are noteworthy as giving promise of a possibly near future in which both the civil and military agencies of the National Government will be made available in promoting the general welfare by co-operation with State and municipal health authorities. These latter are so obviously the ones most directly charged with the protection of the public health that there can be little ground for anticipating the successful enforcement of any scheme of national quarantine—a subject which has been pertinaciously pressed upon the attention of Congress during the last two or three sessions. By existing statute and regulation, a large body of more or less thoroughly trained officials—including the surgeons of the Marine Hospital Service, officers commanding United States forces upon the seaboard, customs officers, and officers of the revenue marine—are required to assist in enforcing local health-laws and quarantines. If to this could be added such assistance as the State Department might readily furnish through its consular officers, and the Department of the Interior through its pension agents and others, the information from all these various sources to be collated and digested by a proper Advisory Board, publishing advices, instructions, and suggestions much as the Signal Service now does concerning meteorological matters—if this could be done, either with or without legislation, there would seem to be little left for the sanatist or advocate of State medicine to ask for.

—The long-awaited Montpensier collection opened on Monday last at the rooms of the Boston Art Museum, and contains, amidst a good deal of the heavy platitude of the commonplace Spanish art, a few pictures of great value. The chief in point of merely artistic interest is, one might say *of course* in a collection of Spanish pictures, a portrait by Velasquez of a head, with indications of a lace collar and scarcely a hint of the shoulders—a most masterly lesson of the qualities of great portraiture, technically invaluable to art-students. The Murillo, a picture of modest pretension in point of size, is one of the most favorable examples of the master to be found amongst the smaller pictures, carefully painted, agreeably composed, and mostly well preserved, the best and least retouched part of it being indeed as excellent painting as anything to be found in the painter's work. Parts of it have been retouched crudely, to the disadvantage of the *ensemble;* but, as a whole, it is an excellent and characteristic example of Murillo's sacred vein—*i.e.*, the material, matter-of-fact Spanish view of nature, made up with wings and halos to suit church purposes, but without a trace of the exaltation or asceticism of the purely religious schools of art. Of four pictures by Zurbaran, one, an Adoration of the Magi, is of the very best vein of this second-rate master, and is in execution, in naïveté of composition, and in quality of wear worthy a place amongst the great masters, among whom Zurbaran fails to be placed from his want of imagination, of ideality, or even of sentiment, as well as from total deficiency of dramatic conception. The others of the series are more or less weak and heavy compared with this. Only six of the twenty-one Spanish pictures are in any way noteworthy, while of the Italian schools there is no representative of any great master, and good ones only of Salvator Rosa, who has two landscapes, of which one is excellent. A single example of ascetic Spanish art, a Pietá by Morales, dry, hard, and painful as it is, is of great interest, and worth all the Riberas, Herreras, Ribaltas, etc., in the collection. A single picture ascribed to Sebastian del Piombo suggests the unlucky dupe of an auction sale in New York. Of the taste which admits to its sensorium such very degradation of the brush as the "Cato tearing out his Entrails" by Ribera, we can only say that it is incomprehensible. The "Repentant Magdalen despoiling herself of her Jewels," by Boccanegra, has a certain value as showing how utterly bad art can be; less bad, but still too bad for human companionship, are some landscapes by Herrera and some so-called Bassanos, while, to show how bad in another way modern art can be, are some pictures of Henri Lehmann and Tony Johannot. But when all is said, the few pictures worthy of commendation are so well worthy of it that the enterprise of the committee has not been thrown away, and these alone are quite enough to repay the trouble that any one may take to visit them.

—Now that we have a full report—apparently a literal translation—of Wurtz's eloquent as well as masterly address, entitled "The Theory of Atoms in the General Conception of the Universe," we find that the short sentence at the close is more terse and neatly pointed than in the version from which we quoted last week. We add it in full:

"Such is the order of nature, and as science penetrates it further she brings to light both the simplicity of the means set at work and the infinite variety of the results. Thus, through the corner of the veil we have been permitted to raise, she enables us to see both the harmony and the profundity of the plan of the universe. Then we enter on another domain which the human mind will always be impelled to enter and explore. It is thus, and you cannot change it. It is in vain that science has revealed to it the structure of the world and the order of all the phenomena; it wishes to mount higher, and in the conviction that things have not in themselves their own *raison d'être*, their support and their origin, it is led to subject them to a first cause—unique, universal God."

Just here, in the difference between Wurtz and Tyndall, is the gist of the question. The predication of intelligent will behind force, viewed as an hypothesis to account for the facts, has the great advantage of being one which the human mind cannot help making. However that be, the hypothesis may justly be thought to stand in about as near a relation to knowledge as does the hypothesis of molecules, or at least of atoms; and why (so far as concerns the principle) the one should be utterly illegitimate and sterile and the other sound, is not apparent. Professor Lovering, in the address from which we quoted last week, closed with a high compliment to the British mathematical physicists—meaning such men as the two Thomsons and Clerk-Maxwell—by whose help "Great Britain has now taken a position in science which she has not held before since the days of Newton." Apropos to what we have been considering, Clerk-Maxwell's presentation of atoms as bearing the marks of being "manufactured articles" might be referred to.

—Professor Tyndall's estimate of Aristotle's powers as a physical philosopher seems to be as wanting in the *Vorstellung* of historical perspective as he believes the Stagirite to have been in physical insight. The greatest difficulty of such an historic sketch of philosophical thought as Tyndall has attempted—a difficulty which often restrains wiser men from the undertaking—is to place the mental powers and services of thinkers rightly in relation to their times. That the inventor of the theory of syllogisms, one who worked out the principle of proof from the beginning to so great completeness that succeeding ages regarded the work as incapable of material improvement, should have been deficient in imagination, or the power of seeing principles in facts, is a rather astounding assertion. Prof. Tyndall also appears to forget that the modern physicist's imagination is essentially a trained one—trained in an accumulated body of experimental and mathematical truths, extensive enough to make over any ordinary genius from what nature may have created him into an investigator who, compared by the machinery of discovery which he can wield, is to Aristotle a giant, but who should modestly attribute his superiority to his training and his implements rather than to his *Vorstellungskraft*. Aristotle was, in fact, a model of an investigator for his time, especially in natural history. That his theories of physics seem to us crude and deficient in accurate ideas, illustrates the importance in the physical sciences generally, including physical biology, of a discipline such as only a great progress in a knowledge of cause-and-effect relations can afford. They neither illustrate Aristotle's powers as a philosopher, nor place even Pascal above him, nor assimilate him for mental one-sidedness to Goethe.

—The *Renaissance*, giving some account of the origin of the hymn known in our books as "Brattle Street," essays a French version of it. The difficulty of the task will be appreciated on comparing the first stanzas of the original and of the translation. One who had been accustomed to sing the former might almost feel that it had suffered in its devotional as well as in its lyric quality by the expansion to which it has been subjected:

"While thee I seek, protecting Power,
Be my vain wishes still'd,
And may this consecrated hour
With better hopes be fill'd."

"Quand c'est toi que je cherche, ô Pouvoir tutélaire,
J'impose le silence aux terrestres soupirs;
Je veux que les instants voués à la prière
Soient pleins des célestes désirs."

There is an obvious loss, on the devotional side, in exchanging the present tense of "*this* consecrated hour" for an indefinite tense.

MR. BAYARD TAYLOR'S 'PROPHET.'*

THE chief truth which Mr. Taylor's 'Prophet' illustrates is one which has been illustrated in the career of many prophets, small and great, since religious fanatics first led followers into wildernesses—the truth, namely, that such messiahs begin by being themselves a prey to their own strongly felt and thoroughly believed delusions, and often end by lending themselves to a wilful

* 'The Prophet: A Tragedy. By Bayard Taylor.' Boston: J. R. Osgood & Co. 1874.
